## THE DEPARTMENTAL EDITORS

FOR LAW AND GOVERNMENT:
THE HON. SIR JOHN SCOTT, K.C.M.G., Deputy Judge-Advocate-General.

FOR MILITARY AFFAIRS:
SIR GEORGE SYDENHAM CLARKE, K.C.M.G., F.R.S.

FOR MEDICAL SCIENCE:
D. NOEL PATON, M.D., B.SC., F.R.C.P.ED.

FOR THEOLOGY:
REV. W. E. COLLINS, M.A., Prof. of Ecclesiastical Hist. at King's Coll., Lond.

FOR MINING:
HENRY M. HOWE, A.M., Prof. of Metallurgy at Columbia University.

FOR BOTANY:
D. H. SCOTT, M.A., PH.D., F.R.S., Hon. Keeper, Jodrell Laboratory, Kew.

FOR GEOGRAPHY AND STATISTICS:
J. SCOTT KELTIE, F.S.S., F.S.A.SCOT., LL.D., Sec. Roy. Geog. Soc.

FOR ASTRONOMY:
SIMON NEWCOMB, PH.D., LL.D.

FOR MATHEMATICS:
JOSEPH LARMOR, M.A., D.SC., SEC.R.S., University Lecturer in Mathematics, Cambridge.

FOR ELECTRICITY:
J. A. FLEMING, M.A., D.SC., F.R.S., Prof. of Electrical Engineering, Univ. Coll., London.

FOR ART:
M. H. SPIELMANN, Editor of the *Magazine of Art*.

FOR ZOOLOGY:
G. HERBERT FOWLER, PH.D.

FOR NAVAL AFFAIRS:
JAS. RICHARD THURSFIELD, M.A.

FOR BIOGRAPHY:
RICHARD GARNETT, C.B., LL.D.

FOR LITERATURE:
EDMUND GOSSE, LL.D.

FOR ECONOMICS:
WYNNARD HOOPER, M.A.

FOR RAILWAYS:
MAJOR HENRY G. PROUT, Editor of *Railroad Gazette*, N.Y.

FOR MUSIC:
J. A. FULLER MAITLAND, M.A., F.S.A.

FOR GAMES AND SPORTS:
ALFRED WATSON, Editor of the *Badminton Library*.

# ENCYCLOPÆDIA BRITANNICA.

## VOLUME XXVII (CHICAGO—ELDUAYEN).

### PRINCIPAL CONTENTS.

PREFATORY ESSAY: THE INFLUENCE OF MODERN RESEARCH ON THE SCOPE OF WORLD-HISTORY. HENRY SMITH WILLIAMS, M.D., B.Sc.

CHICAGO. HARRY PRATT JUDSON, LL.D., Professor of Political Science, University of Chicago.

CHILDREN, CRUELTY TO. W. F. CRAIES, Editor of "Statutes Relating to Criminal Law," &c.

CHILE. The Hon. W. W. ROCKHILL, Head of the Bureau of American Republics, Washington, and C. E. AKERS; *Civil War*, Sir GEORGE SYDENHAM CLARKE, K.C.M.G., F.R.S., Governor of Victoria.

CHINA. GEORGE JAMIESON, C.M.G., and V. CHIROL, Foreign Editor of "The Times"; *China-Japan War*, Sir GEORGE SYDENHAM CLARKE.

CHOLERA. ARTHUR SHADWELL, M.D.

CHRISTIAN CHURCH. The Right Rev. W. BOYD CARPENTER, D.D., D.C.L., Lord Bishop of Ripon.

CHRONOGRAPH. The Rev. F. J. JERVIS-SMITH, F.R.S., Lecturer in Mechanics, Oxford University.

CHRONOLOGY, BIBLICAL. *Old Testament*, S. R. DRIVER, D.D., Regius Professor of Hebrew, Oxford University; *New Testament*, C. H. TURNER, M.A., Fellow of Magdalen College, Oxford.

CHURCH, DEAN. A. C. BENSON, Author of "Life of Archbishop Benson," &c.

CHURCHILL, LORD RANDOLPH. SIDNEY J. LOW.

CIVIL SERVICE. *Great Britain*, Sir JOHN SCOTT, K.C.M.G., D.C.L.; *United States*, Hon. JOHN R. PROCTER, President U.S. Civil Service Commission.

CLANVOWE. EDMUND GOSSE, LL.D.

CLARKE, J. F. Rev. EDWARD EVERETT HALE, S.T.D.

CLEMENT, EPISTLE OF. The Rev. J. ARMITAGE ROBINSON, Ph.D., D.D., Canon of Westminster.

COAL. H. BAUERMAN, F.G.S., Lecturer in Metallurgy, Ordnance College, Woolwich.

COALING STATIONS. Sir GEORGE SYDENHAM CLARKE, K.C.M.G., F.R.S., Governor of Victoria.

COCHIN CHINA. M. DE LANESSAN, formerly Governor-General of French Indo-China.

COCKBURN. E. A. ARMSTRONG, Barrister-at-Law.

CODEX BEZÆ. J. RENDEL HARRIS, Litt.D., LL.D., Lecturer in Palæography, Cambridge University.

CŒLENTERA. G. HERBERT FOWLER, Ph.D.

COLERIDGE, LORD. Sir MOUNTSTUART E. GRANT DUFF, G.C.S.I., F.R.S.

COLOMBIA. The Hon. W. W. ROCKHILL, Head of the Bureau of American Republics, Washington, and C. E. AKERS.

COLORADO. WILLIAM F. SLOCUM, LL.D., President of Colorado College.

COLOURS OF ANIMALS. E. B. POULTON, F.R.S., Hope Professor of Zoology, Oxford University; *Chemistry of*, C. A. MCMUNN, M.D., F.C.S.

COMBINATORIAL ANALYSIS. Major P. A. MACMAHON, Sc.D., F.R.S.

COMETS. EDWARD S. HOLDEN, Sc.D., LL.D., formerly Director of the Lick Observatory.

COMMERCIAL TREATIES. Sir C. M. KENNEDY, K.C.M.G., C.B., formerly Head of Commercial Department, Foreign Office.

COMMONS. Sir ROBERT HUNTER, Solicitor to the Post Office, Author of "The Preservation of Open Spaces."

COMPANIES. E. MANSON, Author of "Practical Guide to Company Law," &c.

COMPASS. Captain ETTRICK W. CREAK, R.N., F.R.S.

COMPENSATION. A. WOOD RENTON, Puisne Judge of Mauritius.

CONDENSATION OF GASES. J. D. VAN DER WAALS, Professor of Physics, Amsterdam University.

CONDUCTION OF HEAT. H. L. CALLENDAR, F.R.S., Professor of Physics, Royal College of Science, London.

CONFESSION, CONFIRMATION. The Rev. W. O. BURROWS, M.A., formerly Principal of Leeds Clergy School.

CONFIRMATION OF BISHOPS. The Rev. W. E. COLLINS, M.A., Professor of Ecclesiastical History, King's College, London.

CONGO FREE STATE. J. SCOTT KELTIE, LL.D., Secretary of the Royal Geographical Society, London.

CONGO RIVER. E. HEAWOOD, M.A., Librarian of the Royal Geographical Society.

CONGREGATIONALISM. The Rev. GEORGE PARK FISHER, D.D., LL.D., Professor of Ecclesiastical History, Yale University; and the Rev. W. E. COLLINS, M.A.

CONNECTICUT. CHARLES HOPKINS CLARK, Editor of the "Hartford Courant," Hartford, Conn.

CONSTANTINOPLE. E. WHITAKER, Editor of the "Constantinople Messenger"; *Archæology*, A. VAN MILLINGEN, Author of "Byzantine Constantinople."

CONTRACT. Sir FREDERICK POLLOCK, LL.D., Corpus Professor of Jurisprudence, Oxford University.

CONVEYANCING. S. WADSWORTH, M.A., Barrister-at-Law.

CO-OPERATIVE SOCIETIES. ANEURIN WILLIAMS.

COPENHAGEN. C. A. GOSCH, Attaché to the Danish Legation in Great Britain.

COPPER. JAMES DOUGLAS, LL.D., Past President Amer. Inst.M.E.

COPTIC CHURCH. A. J. BUTLER, M.A., Fellow of Brasenose College, Oxford.

COPYRIGHT. *British*, T. E. SCRUTTON, K.C.; *United States*, GEORGE HAVEN PUTNAM, Litt.D., Author of the "Question of Copyright"; *Artistic*, EDWARD BALE, R.I.

CORINTH. Professor RUFUS B. RICHARDSON, Director American School of Classical Studies, Athens.

COROT. D. CROAL THOMSON, Editor of "The Art Journal."

CORSICA. PAUL LOUIS.

COSSACKS. Prince KROPOTKIN.

COTTON PRINTING. LEWIS F. DAY, Examiner for Art, Board of Education.

CREATIANISM. The Rev. ALEXANDER NAIRNE, M.A., Professor of Hebrew and Old Testament Exegesis, King's College, London.

CREEDS. The Rev. A. E. BURN, Author of "The Athanasian Creed," &c.

CREIGHTON. The Rev. W. E. COLLINS, M.A.

CREMATION. Sir HENRY THOMPSON, Bart., F.R.C.S., President of the Cremation Society.

# PREFATORY ESSAY.

## THE INFLUENCE OF MODERN RESEARCH ON THE SCOPE OF WORLD-HISTORY.

**By Henry Smith Williams, M.D., B.Sc.**

WHEN Queen Victoria came to the throne, the year 4004 B.C. was accepted, in all sobriety, as the date of the creation of the world. Perhaps no single statement could more vividly emphasize the change in the point of view from which scholars regard the chronology of ancient history than the citation of this indisputable fact. To-day, though Bibles are still printed with the year 4004 B.C. in the margin of the first chapter of Genesis, no scholar would pretend to regard this reference seriously. On the contrary, the scholarship of to-day regards the fifth millennium B.C. as well within the historical period for such nations as the Egyptians and the Babylonians. It has come to be fully accepted, that when we use such a phrase as "the age of the world" we are dealing with a period that must be measured not in thousands but in millions of years; and that to the age of man must be allotted a period some hundreds of times as great as the five thousand and odd years allowed by the old chronologists. This changed point of view, needless to say, has not been reached without ardent and even bitter controversy. Yet the transformation is unequivocal; and the revised conception no longer seems to connote the theological implications that were at first ascribed to it. It has now become obvious that the data afforded by the Hebrew writings should never have been regarded as sufficiently accurate for the purpose of exact historical computations: that, in short, no historian working along modern scientific lines could well have made the mistake of supposing that the genealogical lists of the Pentateuch afforded an adequate chronology of world-history. But it should not be forgotten that to many generations of close scholarship these genealogical lists seemed to convey such knowledge in the most precise terms, and that at so recent a date as, for example, the year in which Queen Victoria came to the throne, it was nothing less than a rank heresy to question the historical accuracy and finality of chronologies which had no other source or foundation.

This changed point of view regarding the chronology of history may without hesitation be ascribed to the influence of evidence obtained in a single field of inquiry, the field, namely, of Archæology. No doubt the evidence as to the age of the earth and as to the antiquity of man was gathered by a class of workers not formally included in the ranks of the archæologist: workers commonly spoken of as palæontologists, anthropologists, ethnologists, and the like. But the distinction scarcely covers a real difference. The scope of the archæologist's studies must include every department of the ancient history of man as preserved in antiquities of whatever character, be they tumuli along the Baltic, fossil skulls and graven

bones from the caves of France, the flint implements, pottery, and mummies of Egypt, tablets and bas-reliefs from Mesopotamia, coins and sculptures of Greece and Rome, or inscriptions, waxen tablets, parchment rolls, and papyri of a relatively late period of classical antiquity.

If at one time the monuments of Greece and Rome claimed the almost undisputed attention of the archæologist, that time has long since passed. For the most important historical records that have come to us in recent decades we have to thank the Orientalist, though the classical explorer has been by no means idle. It is the purpose of the present essay to point out in general terms the import of the message of archæological discovery in the Victorian Era in its bearings upon the great problems of world-history. Perhaps this purpose may be best attained if we take up these problems one after another, contrasting in each case the old point of view with the new, and briefly outlining the evidence on which the present decision rests. This, of course, is not the place for details as to the archæological discoveries involved. Here we have to do with only such discoveries as have led to broad historical generalizations regarding such subjects as the Antiquity of Man, the Antiquity of Culture, the Chronology of Ancient History, the Status of Bible History, the Credibility of Early Classical History, the Origin and Development of the Art of Writing, and the Evolution of the Fine Arts.

*The Antiquity of Man, the Antiquity of Civilization, and the Chronology of Ancient History.*

With regard to the changed conception as to the age of the earth, it is necessary to recall that this came about through the efforts of the palæontologists and geologists, with only indirect or incidental aid from the archæologists. The reform movement began actively with James Hutton in the later years of the 18th century, and was forwarded by the studies of William Smith in England and of Cuvier in France; but the really efficient champion of the conception that the earth is very old was Sir Charles Lyell, who published the first edition of his epoch-making *Principles of Geology* only a few years before Queen Victoria came to the throne. Lyell demonstrated to the satisfaction, or—perhaps it should rather be said—to the dissatisfaction, of his contemporaries that the story of the geological ages as recorded in the strata of the earth becomes intelligible only when vast stretches of time are presupposed. Of course the demonstration was not accepted at once. On the contrary, the champions of the tradition that the earth was less than six thousand years old held their ground most tenaciously, and the earlier years of the Victorian Era were years of bitter controversy. The result of the contest was never in doubt, however, for the geological evidence, once it had been gathered, was unequivocal; and by about the middle of the century it was pretty generally admitted that the age of the earth must be measured by an utterly different standard from that hitherto in vogue. This concession, however, by no means implied a like change of view regarding the age of man. A fresh volume of evidence required to be gathered, and a new controversy to be waged, before the old data for the creation of man could be abandoned. Lyell again was in the forefront of the progressive movement, and his work on *The Antiquity of Man*, published in 1863, gave currency for the first time to the new opinions. The evidence upon which these opinions were based had been gathered by such anthropologists as Schmerling, Boucher de Perthes, and others, and it had to do chiefly with the finding of implements of human construction associated with the remains of extinct animals in the beds of caves, and with the recovery of similar antiquities from alluvial deposits the great age of which was demonstrated by their depth. Every item of the evidence was naturally subjected to the closest scrutiny, but at last the conservatives were forced reluctantly to confess themselves beaten. Their traditional arguments were powerless before the array of data marshalled by the new science of prehistoric archæology. Looking back even at the short remove of a single generation, it is difficult to appreciate how revolutionary was the conception of the antiquity of man thus inculcated. It rudely shocked the traditional attitude of scholarship towards the history of our race. It disturbed the most cherished traditions and the most sacred themes. It seemed to threaten the very foundations of religion itself. Yet the present generation accepts the antiquity of man as a mere matter of fact. Here, as so often elsewhere, the heresy of an elder day has come to seem almost an axiomatic truth.

This is not the place to suggest, even in the roughest outline, the social, ethical, and religious implications that were bound inseparably with the revolutionary conception as to man's creation. It may not be amiss to add, however, that in establishing the broad fact of man's antiquity, prehistoric archæology as yet falls short of the power to estimate, even roughly, in terms of years the periods with which it deals; and history, in the narrower sense, can hardly be said to exist without chronology. On the other hand, some of the most remarkable advances for which the historian must thank the archæologist have to do with the chronology of the early periods of Oriental history. Indeed, the greatest feat of the archæologist has been the opening up to our observation, and the bringing within the scope of the historian, of long periods which, without his aid, must still have belonged to the vague realms of the prehistoric.

If we go back in imagination to the beginning of the Victorian Era and ask what was then known of the history of Ancient Egypt, Mesopotamia, and Asia Minor, we find ourselves confronted with a startling paucity of knowledge. The key to the mysteries of Egyptian history had indeed been found, thanks to the recent efforts of Thomas Young and Champollion, but the deciphering of inscriptions had not yet progressed far enough to give more than a vague inkling of what was to follow. It remained, then, virtually true, as it had been for two thousand years, that for all that we could learn of the history of the Old Orient in pre-classical days, we must go solely to the pages of the Bible and to a few classical authors, notably Herodotus and Diodorus. A comparatively few pages summed up, in language often vague and mystical, all that the modern world had been permitted to remember of the history of the greatest nations of antiquity. To these nations the classical writers had ascribed a traditional importance, the glamour of which still lighted their names, albeit revealing them in the vague twilight of tradition rather than in the clear light of history. It would have been a bold, not to say a reckless, dreamer who dared predict that any future researches could restore to us the lost knowledge that had been forgotten for more than two millenniums. Yet the Victorian Era was scarcely ushered in before the work of rehabilitation began, which was to lead to the most astounding discoveries and to an altogether unprecedented extension of historical knowledge. Early in the 'forties the Frenchman Botta, quickly followed by Sir Henry Layard, began making excavations on the site of ancient Nineveh, the name and fame of which were a tradition having scarcely more than mythical status. The spade of the discoverer soon showed that all the fabled glories of the ancient Assyrian capital were founded on realities, and evidence was afforded of a state of civilization and culture such as few men supposed to have existed on the earth before the Golden Age of Greece. Not merely were artistic sculptures and bas-reliefs found that demonstrated a high development of artistic genius, but great libraries were soon revealed,—books consisting of bricks of various sizes, or of cylinders of the same material, inscribed while in the state of clay with curious characters, which became indelible when baking transformed the clay into brick. No one was able to guess, even in the vaguest way, the exact interpretation of these odd characters; but, on the other hand, no one could doubt that they constituted a system of writing, and that the piles of inscribed tablets were veritable books. There were numerous sceptics, however, who did not hesitate to assert that the import of the message so obviously locked in these curious inscriptions must for ever remain an absolute mystery. Here, it was said, were inscriptions written in an unknown character and in a language that for at least two thousand years had been absolutely forgotten. In such circumstances nothing less than a miracle could enable human ingenuity to fathom the secret. Yet the feat pronounced impossible by mid-century scepticism was accomplished by contemporary scholarship, amidst the clamour of opposition and incredulity. Its success contains at once a warning to those doubters who are always crying out that we have reached the limitations of knowledge, and an encouragement and stimulus to would-be explorers of new intellectual realms.

In a few words the manner of the discovery was this. It appears at a glance that the Assyrian written character consists of groups of horizontal, vertical, or oblique strokes. The characters thus composed, though so simple as to their basal unit, are appallingly complex in their elaboration. The Assyrians, with all their culture, never attained the stage of analysis which demonstrates that only a few fundamental

sounds are involved in human speech, and hence that it is possible to express all the niceties of utterance with an alphabet of little more than a score of letters. Halting just short of this analysis, the Assyrian ascribed syllabic values to the characters of his script, and hence, instead of finding twenty odd characters sufficient, he required about five hundred. There was a further complication in that each one of these characters had at least two different phonetic values; and there were other intricacies of usage which, had they been foreknown by inquirers in the middle of the 19th century, might well have made the problem of decipherment seem an utterly hopeless one.

Fortunately it chanced that another people, the Persians, had adopted the Assyrian wedge-shaped stroke as the foundation of a written character, but, making that analysis of which the Assyrians had fallen short, had borrowed only so many characters as were necessary to represent the alphabetical sounds. This made the problem of deciphering Persian inscriptions a relatively easy one. In point of fact this problem had been partially solved in the early days of the 19th century, thanks to the sagacious guesses of the German philologist Grotefend. Working with some inscriptions from Persepolis which were found to contain references to Darius and Xerxes, Grotefend had established the phonetic values of certain of the Persian characters, and his successors were perfecting the discovery just about the time when the new Assyrian finds were made. It chanced that there existed on the polished surface of a cliff at Behistun in Western Persia a tri-lingual inscription which, according to Diodorus, had been made by Queen Semiramis of Nineveh, but which, as is now known, was really the work of King Darius. One of the languages of this inscription was Persian; another, as it now appeared, was Assyrian, the language of the newly discovered books from the libraries of Nineveh. There was reason to suppose that the inscriptions were identical in meaning; and fortunately it proved, when the inscriptions were made accessible to investigation through the efforts of Sir Henry Rawlinson, that the Persian inscription contained a large number of proper names. It was well known that proper names are usually transcribed from one language into another with a tolerably close retention of their original sounds. For example, the Greek names *Ptolemaios* and *Kleopatra* became a part of the Egyptian language and appeared regularly in Egyptian inscriptions after Alexander's general became King of Egypt. Similarly, the Greek names *Kyros*, *Darios*, and *Xerxes* were as close an imitation as practicable of the native names of these Persian monarchs. Assuming, then, that the proper names found in the Persian portion of the Behistun inscription occurred also in the Assyrian portion, retaining virtually the same sound in each, a clue to the phonetic values of a large number of the Assyrian characters was obviously at hand. Phonetic values known, Assyrian was found to be a Semitic language cognate to Hebrew.

These clues were followed up by a considerable number of investigators, with Sir Henry Rawlinson in the van. Thanks to their efforts, the new science of Assyriology came into being, and before long the message of the Assyrian books had ceased to be an enigma. Of course this work was not accomplished in a day or in a year, but, considering the difficulties to be overcome, it was carried forward with marvellous expedition. In 1857 the new scholarship was put to a famous test, in which the challenge thrown down by Sir George Cornewall Lewis and Ernest Renan was met by Rawlinson, Hincks, Oppert, and Fox Talbot in a conclusive manner. The sceptics had declared that the new science of Assyriology was itself a myth: that the investigators, self-deceived, had in reality only invented a language, and read into the Assyrian inscriptions something utterly alien to the minds of the Assyrians themselves. But when a committee of the Royal Asiatic Society, with George Grote at its head, decided that the translations of an Assyrian text made independently by the scholars just named were at once perfectly intelligible and closely in accord with one another, scepticism was silenced, and the new science was admitted to have made good its claims.

Naturally the early investigators did not fathom all the niceties of the language, and the work of grammatical investigation has gone on continuously under the auspices of a constantly growing band of workers. Doubtless much still remains to be done; but the essential thing, from the present standpoint, is that a sufficient knowledge of the Assyrian language has been acquired to ensure trustworthy translations of

the cuneiform texts. Meanwhile, the material found by Botta and Layard, and other successors, in the ruins of Nineveh has been constantly augmented through the efforts of companies of other investigators, and not merely Assyrian, but much earlier Babylonian and Chaldæan texts in the greatest profusion have been brought to the various museums of Europe and America. The study of these different inscriptions has utterly revolutionized our knowledge of Oriental history. Many of the documents are strictly historical in their character, giving full and accurate contemporary accounts of events that occurred some thousands of years ago. Exact dates are fixed for long series of events that previously were quite unknown. Monarchs whose very names had been forgotten are restored to history, and the records of their deeds inscribed under their very eyes are before us,—contemporary documents such as neither Greece nor Rome could boast, nor any other nation, with the single exception of Egypt, until strictly modern times.

There are, no doubt, gaps in the record; there are long periods for which the chronology is still uncertain. Naturally there is an increasing vagueness as one recedes further into the past, and for the earlier history of Chaldæa there is great uncertainty. Nevertheless, the Assyriologist speaks with a good deal of confidence of dates as remote as 3800 B.C., the time ascribed to King Sargon, who was once regarded as a mythical person, but is now known to have been an actual monarch. Indeed, there are tablets in the British Museum labelled 4500 B.C.; and later researches, particularly those of the expedition of the University of Pennsylvania at Nippur, have brought us evidence which, interpreted with the aid of estimates as to the average rate of accumulation of dust deposits, leads to the inference that a high state of civilization had been attained in Mesopotamia at least 9000 years ago.

While the Assyriologists have been making these astonishing revelations, the Egyptologists have not been behindhand. Such scholars as Lepsius, Brugsch, de Rougé, Lenormant, Birch, Mariette, Maspero, and Erman have perfected the studies of Young and Champollion; while at the same time these and a considerable company of other explorers, most notable of whom are Gardner Wilkinson and Professor Flinders Petrie, have brought to light a vast accumulation of new material, much of which has the highest importance from the standpoint of the historian. Lists of kings found on the temple wall at Abydos, in the fragments of the Turin papyrus and elsewhere, have cleared up many doubtful points in the lists of Manetho, and at the same time, as Professor Petrie has pointed out, have proved to us how true a historian that much-discussed writer was. Manetho, it will be recalled, was the Egyptian who wrote the history of Egypt in Greek in the time of the Ptolemies. His work in the original unfortunately perished, and all that we know of it we learn through excerpts made by a few later classical writers. These fragments have until recently, however, given us our only clue to the earlier periods of Egyptian history. Until corroboration was found in the Egyptian inscriptions themselves, not only were Manetho's lists in doubt, but scepticism had been carried to the point of denying that Manetho himself had ever existed. This is only one of many cases where the investigations of the archæologist have proved not iconoclastic but reconstructive, tending to restore confidence in classical traditions which the scientific historians of the age of Niebuhr and George Cornewall Lewis regarded with scepticism.

As to the exact dates of early Egyptian history there is rather more of vagueness than for the corresponding periods of Mesopotamia. Indeed, approximate accuracy is not attained until we are within sixteen hundred years of our own era; but the sequence of events of a period preceding this by two thousand years is well established, and the recent discoveries of Professor Petrie carry back the record to a period which cannot well be less than five thousand, perhaps not less than six thousand years B.C. Both from Egypt and Mesopotamia, then, the records of the archæologist have brought us evidence of the existence of a highly developed civilization for a period exceeding by hundreds, perhaps by thousands, of years the term which had hitherto been considered the full period of man's existence.

We may note at once how these new figures disturb the historical balance. If our forerunners of eight or nine thousand years ago were in a noonday glare of civilization, where shall we look for the

much-talked-of "dawnings of history"? By this new standard the Romans seem our contemporaries in latter-day civilization; the "Golden Age" of Greece is but of yesterday; the pyramid-builders are only relatively remote. The men who built the temple of Bel at Nippur, in the year (say) 5000 B.C., must have felt themselves at a pinnacle of civilization and culture. As Professor Mahaffy has suggested, the era of the Pyramids may have been the veritable autumn of civilization. Where, then, must we look for its springtime? The answer to that question must come, if it come at all, from what we now speak of as prehistoric archæology; the monuments from Memphis and Nippur and Nineveh, covering a mere ten thousand years or so, are records of recent history.

*Archæology and Bible History.*

The efforts of the students of Oriental archæology have been constantly stimulated by the fact that their studies brought them more or less within the field of Bible history. A fair proportion of the workers who have delved so enthusiastically in the fields of Egyptian and Assyrian exploration would never have taken up the work at all but for the hope that their investigations might substantiate the Hebrew records. For a long time this hope proved illusory, and in the case of Egyptian archæology the results have proved disappointing even up to the very present. Considering the important part played by the Egyptian sojourn of the Hebrews, as narrated in the Scriptures, it was certainly not an over-enthusiastic prediction that the Egyptian monuments when fully investigated would divulge important references to Joseph, to Moses, and to the all-important incidents of the Exodus; but half a century of expectant attention in this direction has led only to disappointment. It would be rash, considering the buried treasures that may yet await the future explorer, to assert that such records as those in question can never come to light. But, considering the fulness of the contemporary Egyptian records of the XIXth dynasty that are already known, it becomes increasingly doubtful whether the Hebrews in Egypt played so important a part in history, when viewed from the Egyptian standpoint, as their own records had seemed to imply. As the forgotten history of Oriental antiquity has been restored to us, it has come to be understood that, politically speaking, the Hebrews were a relatively insignificant people, whose chief importance from the standpoint of material history was derived from the geographical accident that made them a sort of buffer between the greater nations about them. Only once, and for a brief period, in the reigns of David and Solomon did the Hebrews rise to anything like an equal plane of political importance with their immediate neighbours. What gave them a seeming importance in the eyes of posterity was the fact that the true history of the Egyptians, Mesopotamians, Arabians, and Hittites had been well-nigh forgotten. The various literatures of these nations were locked from view for more than two thousand years, while the literature of Israel had not merely been preserved, but had come to be regarded as inspired and sacred among all the cultured nations of the Western world. Now that the lost literatures have been restored to us, the status of the Hebrew writings could not fail to be disturbed. Their very isolation had in some measure accounted for their seeming importance.

All true historical perspective is based upon comparison, and where only a single account has been preserved of any event or of any period of history, it is extremely difficult to judge that account with historical accuracy. An illustration of this truth is furnished in profane history by the account which Thucydides has given us of the Peloponnesian War. For most of the period in question Thucydides is the only source; and despite the inherent merits of a great writer, it can hardly be doubted that the tribute of almost unqualified praise that successive generations of scholars have paid to Thucydides must have been in some measure qualified if, for example, a Spartan account of the Peloponnesian War had been preserved to us. Professor Mahaffy has pointed out that many other events in Greek history are viewed by us in somewhat perverted perspective because the great writers of Greece were Athenians rather than Spartans or Thebans. Even in so important a matter as the great conflict between Persia and Greece it has been suggested more than once that we should be able to gain a much truer view were Persian as well as Greek accounts accessible.

Not many years ago it would have been accounted a heresy to suggest that the historical books of the Old Testament had conveyed to our minds estimates of Oriental history that suffered from this same defect; but to-day no one who is competent to speak with authority pretends to doubt that such is really the fact. Even conservative students of the Bible urge that its historical passages must be viewed precisely in the light of any other historical writings of antiquity; and the fact that the oldest Hebrew manuscript dates only from the 8th century A.D., and therefore of necessity brings to us the message of antiquity through the fallible medium of many generations of copyists, is far more clearly kept in mind than it formerly was. Every belief of mankind is in the last analysis amenable to reason, and finds its origin in evidence that can appeal to the arbitrament of common sense. This evidence may in certain cases consist chiefly of the fact that generations of our predecessors have taken a certain view regarding a certain question; indeed most of our cherished beliefs have this foundation. But when such is the case, mankind has never failed in the long-run to vindicate its claim to rationality by showing a readiness to give up the old belief whenever tangible evidence of its fallaciousness was forthcoming. The case of the historical books of the Old Testament furnishes no exception. These had been sacred to almost a hundred generations of men, and it was difficult for the eye of faith to see them as other than absolutely infallible documents. Yet the very eagerness with which the champions of the Hebrew records searched for archæological proofs of their validity, was a tacit confession that even the most unwavering faith was not beyond the reach of external evidence. True, the believer sought corroboration with full faith that he would find it; but the very fact that he could think such external corroboration valuable implied, however little he may have realized it, the subconscious concession that he must accept external evidence at its full value, even should it prove contradictory. If, then, an Egyptian inscription of the XIXth dynasty had come to hand in which the names of Joseph and Moses, and the deeds of the Israelites as a subject people who finally escaped from bondage by crossing the Red Sea, were recorded in hieroglyphic characters, such a monument would have been hailed with enthusiastic delight by every champion of the Pentateuch, and a wave of supreme satisfaction would have passed over all Christendom.

It is not too much, then, to say that failure to find such a monument has caused deep disappointment to Bible scholars everywhere. It does not follow that faith in the Bible record is shaken, although in some quarters there has been a pronounced tendency to regard the history of the Egyptian sojourn as mythical; yet it cannot be denied that Egyptian records, corroborating at least some phases of the Bible story, would have been a most welcome addition to our knowledge. Some recent finds have, indeed, seemed to make inferential reference to the Hebrews, and the marvellous collection of letters of the XVIIIth dynasty found at Tel el-Amarna—letters to which we shall refer later—have the utmost importance as proving a possible early date for the Mosaic accounts. But such inferences as these are but a vague return for the labour expended, and an almost cruelly inadequate response to seemingly well-founded expectations.

When we turn to the field of Babylonian and Assyrian archæology, however, the case is very different. Here we have documents in abundance that deal specifically with events more or less referred to in the Bible. The records of kings whose names hitherto were known to us only through Bible references have been found in the ruins of Nineveh and Babylon, and personages hitherto but shadowy now step forth as clearly into the light of history as an Alexander or a Cæsar. Moreover, the newly discovered treasures deal with the beliefs of the people as well as with their history proper. The story of the books now spoken of as the "Creation" and "Deluge" tablets of the Assyrians, in the British Museum, which were discovered in the ruins of Nineveh by Layard and by George Smith, has been familiar to everyone for a good many years. The acute interest which they excited when George Smith deciphered their contents in 1872 has to some extent abated, but this is only because scholars are now pretty generally agreed as to their bearing on the corresponding parts of Genesis. The particular tablets in question date only from about the 7th century B.C., but it is agreed among Assyriologists that they are copies of older texts current in Babylonia for many centuries before, and it is obvious

that the compilers of Genesis had access to the Babylonian stories. In a word, the Hebrew Genesis shows unequivocal evidence of Babylonian origin, but, in the words of Professor Sayce, it is but "a paraphrase and not a translation." However disconcerting such a revelation as this would have been to the theologians of an elder day, the Bible scholars of our own generation are able to regard it with entire composure.

From the standpoint of the historian even greater interest attaches to the records of the Assyrian and Babylonian kings when compared with the historical books of the Old Testament. For some centuries the inhabitants of Palestine were subject to periodical attacks from the warlike inhabitants of Mesopotamia, as even the most casual reader of the Bible is aware. When it became known that the accounts of these invasions formed a part of the records preserved in the Assyrian libraries, historian and theologian alike waited with breathless interest for the exact revelations in store; and this time expectation was not disappointed. As, one after another, the various tablets and cylinders and annalistic tablets have been translated, it has become increasingly clear that here are almost inexhaustible fountains of knowledge, and that sooner or later it may be possible to check the Hebrew accounts of the most important periods of their history with contemporaneous accounts written from another point of view. It is true that the cases are not very numerous where precisely the same event is described from opposite points of view, but, speaking in general terms rather than of specific incidents, we are already able to subject considerable portions of history to this test.

The records of Shalmaneser II., Tiglath-Pileser III., and Sennacherib, kings of Assyria, of Nebuchadrezzar, king of Babylon, and of Cyrus, king of Persia, all contain direct references to Hebrew history. An obelisk of Shalmaneser II. contains explicit reference to the tribute of Jehu of Samaria, and graphically depicts the Hebrew captives. Tiglath-Pileser III., a usurper who came to the throne of Assyria in 745 B.C., and whose earlier name of Pul proved a source of confusion to the later Hebrew writers, left records that have served to clear up the puzzling chronology of a considerable period of the history of Samaria. Most interesting of all, perhaps, are the annals of Sennacherib, the destruction of whose hosts by the angel of God is so strikingly depicted in the Book of Kings. The court historian of Sennacherib naturally does not dwell upon this event, but he does tell of an invasion and conquest of Palestine. The Hebrew account of the death of Sennacherib is corroborated by a Babylonian inscription. Here, however, there is an interesting qualification. The account in the Book of Kings is so phrased that one might naturally infer from it that Sennacherib was assassinated by his sons immediately after his return from the disastrous campaign in Palestine; but in point of fact, as it now appears, the Assyrian king survived that campaign by twenty years. One cannot avoid the suspicion that in this instance the Hebrew chronicler purposely phrased his account to convey the impression that Sennacherib's tragic end was but the slightly delayed culmination of the punishment inflicted for his attack upon the "chosen people." On the other hand, the ambiguity may be quite unintentional, for the Hebrew writers were notoriously lacking in the true historical sense, which shows itself in a full appreciation of the value of chronology.

One of the most striking instances of the way in which mistakes of chronology may lead to the perversion of historical records is shown in the Book of Daniel in connexion with the familiar account of the capture of Babylon by Cyrus. Within the past generation records of Cyrus have been brought to light, as well as records of the conquered Babylonian king himself, which show that the Hebrew writers of the later day had a peculiarly befogged impression of a great historical event—their misconception being shared, it may be added, by the Greek historian Herodotus. When the annalistic tablet of Cyrus was translated, it was made to appear, to the consternation of Bible scholars, that the city of Babylon had capitulated to the Persian—or more properly to the Elamite—conqueror without a struggle. It appeared, further, that the king ruling in Babylon at the time of the capitulation was named not Belshazzar, but Nabonidos. This king, as appears from his own records, had a son named Belshazzar, who commanded Babylonian armies in outlying provinces, but who never came to the throne. Nothing

could well be more disconcerting than such a revelation as this. It is held, however, that the startling discrepancies are not so difficult to explain as may appear at first sight. The explanation is found, so the Assyriologist assures us, in the fact that both Hebrew and Greek historians, writing at a considerable interval after the events, and apparently lacking authentic sources, confused the peaceful occupation of Babylon by Cyrus with its siege and capture by a successor to that monarch, Darius Hystaspes. As to the confusion of Babylonian names,—in which, by the way, the Hebrew and Greek authors do not agree,—it is explained that the general, Belshazzar, was perhaps more directly known in Palestine than his father the king. But the vagueness of the Hebrew knowledge is further shown by the fact that Belshazzar, alleged king, is announced as the son of Nebuchadrezzar (misspelled Nebuchadnezzar in the Hebrew writings), while the three kings that reigned after Nebuchadrezzar, and before Nabonidos usurped the throne, are quite overlooked.

Our present concern with the archæological evidence thus briefly outlined, and with much more of the kind, may be summed up in the question: What in general terms is the inference to be drawn by the world-historian from the Assyrian records in their bearings upon the Hebrew writings? At first sight this might seem an extremely difficult question to answer. Indeed, to answer it to the satisfaction of all concerned might well be pronounced impossible. Yet it would seem as if a candid and impartial historian could not well be greatly in doubt in the matter. On the one hand, the general agreement everywhere between the Hebrew accounts and contemporaneous records from Mesopotamia proves beyond cavil that, broadly speaking, the Bible accounts are historically true, and were written by persons who in the main had access to contemporaneous documents. On the other hand, the discrepancies as to details, the confusion as to exact chronology, the manifest prejudice and partizanship, and the obvious limitations of knowledge make it clear that the writers partook in full measure of the shortcomings of other historians, and that their work must be adjudged by ordinary historical standards.

As much as this is perhaps conceded by most, if not all, schools of Bible criticism of to-day. Professor Sayce, one of the most distinguished of Oriental Assyriologists, writing as an opponent of the purely destructive "Higher Criticism," demands no more than that the Book of Genesis "shall take rank by the side of the other monuments of the past as the record of events which have actually happened and been handed on by credible men"; that it shall, in short, be admitted to be "a collection of ancient documents which have all the value of contemporaneous testimony," but which being in themselves "wrecks of vast literatures which extended over the Oriental world from a remote epoch," cannot be understood aright "except in the light of the contemporaneous literature of which they form a portion." From the point of view implied by such words as these, it is only necessary to recall the mental attitude of our grandfathers to appreciate in some measure the revolution in thought that has been wrought in this field within the last half-century, largely through the instrumentality of Oriental archæology.

### *Archæology and Classical History.*

We have just seen that the general trend of Oriental Archæology has been reconstructive rather than iconoclastic. Equally true is this of recent Classical Archæology. Here no such revolution has been effected as that which virtually created anew the history of Oriental Antiquity; yet the bearings of the new knowledge are similar in kind if different in degree. The world had never quite forgotten the history of the primitive Greeks as it had forgotten the Mesopotamians, the Himyaritic nations, and the Hittites; but it remembered their deeds only in the form of poetical myths and traditions. These traditions, finding their clearest delineation in the lines of Homer, had been subjected to the analysis of the critical historians of the early decades of the 19th century, and their authenticity had come to be more than doubted. The philological analysis of Wolf and his successors had raised doubts as to the very existence of Homer, and at one time the main current of scholarly opinion had set strongly in the direction of the belief that the *Iliad* and the *Odyssey* were in reality but latter-day collections of divers

recitals that had been handed down by word of mouth from one generation to another of bards through ages of illiteracy. It was strenuously contended that the case could not well be otherwise, inasmuch as the art of writing must have been quite unknown in Greece until after the alleged age of the traditional Homer, whose date had been variously estimated at from 1000 to 800 B.C. by less sceptical generations. It had come to be a current belief that the *Iliad* was first committed to writing in the age of Pisistratus. A prominent controversialist, Mr Paley, even went so far as to doubt whether a single written copy of the *Iliad* existed in Greece at the time of the Peloponnesian War. The doubts thus cast upon the age when the Homeric poems first assumed the fixed form of writing were closely associated with the universal scepticism as to the historical accuracy of any traditions whatever regarding the early history of Greece. Cautious historians had come to regard the so-called "Heroic Age" as a prehistoric period regarding which nothing definite was known, or in all probability could be known. It was ably argued by Sir George Cornewall Lewis, in connexion with his inquiries into early Roman history, that a verbal tradition is not transmitted from one generation to another in anything like an authentic form for a longer period than about a century. If, then, the art of writing was unknown in Greece before, let us say, the 6th century B.C., it would be useless to expect that any events of Grecian history prior to about the 7th century B.C. could have been transmitted to posterity with any degree of historical accuracy.

Notwithstanding the allurements of the subject, such conservative historians as Grote were disposed to regard the problems of early Grecian history as inscrutable, and to content themselves with the recital of traditions without attempting to establish their relationship with actual facts. It remained for the more robust faith of a Schliemann to show that such scepticism was all too faint-hearted, by proving that at such sites as Tiryns, Mycenæ, and Hissarlik evidences of a very early period of Greek civilization awaited the spade of the excavator. Thanks to the enthusiasm of Schliemann and his successors, we can now substitute for the mythical "Age of Heroes" a historical "Mycenæan Age" of Greece, and give tangible proof of its relatively high stage of civilization. Schliemann may or may not have been correct in identifying one of the seven cities that he unearthed at Hissarlik as the fabled Troy itself, but at least his efforts sufficed to give verisimilitude to the Homeric story. With the lessons of recent Oriental archæology in mind, few will be sceptical enough to doubt that some such contest as that described in the *Iliad* actually occurred. And now, thanks to the efforts of a large company of workers, notably Dr Arthur Evans and his associates in Cretan exploration, we are coming to speak with some confidence not merely of a Mycenæan but of a pre-Mycenæan Age.

As yet we see these periods somewhat darkly. The illuminative witness of written records is in the main denied us here. Some most archaic inscriptions have indeed been found by the explorers in Crete, but these for the present serve scarcely any other purpose than to prove the antiquity of the art of writing among a people who were closely in touch with the inhabitants of Hellas proper. Most unfortunately for posterity, the Greeks wrote mainly on perishable materials, and hence the chief records even of their later civilization have vanished. The only fragments of Greek manuscripts antedating the Christian era that have been preserved to us have been found in Egypt, where a hospitable climate granted them a term of existence not to be hoped for elsewhere. No fragment of these papyri, indeed, carries us further back than the age of the Ptolemies; but the Greek inscriptions on the statues of Rameses II. at Abu-Simbel, in Nubia, give conclusive proof that the art of writing was widely disseminated among the Greeks at least three centuries before the age of Alexander. This carries us back towards the traditional age of Homer.

The Cretan inscriptions belong to a far older epoch, and are written in two non-Grecian scripts of undetermined affinities. Here, then, is direct evidence that the Aegean peoples of the Mycenæan Age knew how to write, and it is no longer necessary to assume that the verses of the *Iliad* were dependent on mere verbal transmission for any such period as has been supposed.

But even were direct evidence of the knowledge of the art of writing in Greece of the early day

altogether lacking, none but the hardiest sceptic could doubt, in the light of recent archæological discoveries elsewhere, that the inhabitants of ancient Hellas of the "Homeric Age" must have shared with their contemporaries the capacity to record their thoughts in written words. We have seen that Oriental archæology has in recent generations revolutionized our conceptions of the antiquity of civilization. We have seen that written documents have been preserved in Mesopotamia to which such a date as 4500 B.C. may be ascribed with a good deal of confidence; and that from the third millennium B.C. a flood of contemporary literary records comes to us both from Egypt and Mesopotamia. But until recently it had been supposed that Hellas was shut out entirely from this Oriental culture. Historians have found it hard to dispel the idea that civilization in Greece was a very late development, and that the culture of the age of Solon sprang, in fact, suddenly into existence, as it seems to do in the records of the historian. But the excavations that have given us a knowledge of the Mycenæan Age have proved conclusively, not alone that civilization existed in Greece in an early day, but that this civilization was closely linked with the civilization of Egypt. Not only have antiquities been found in Crete that point to Egyptian inspiration, but quite recently Professor Petrie has found at Tel el-Amarna Mycenæan pottery. The latter find has a peculiar significance, since the date of the Tel el-Amarna collection is definitely fixed between the years 1400 and 1370 B.C.

It is demonstrated, then, that as early as the beginning of the 14th century B.C. the Mycenæan civilization was in touch with the ancient civilization of Egypt. One must not infer from this, however, that the two civilizations met on anything like an equality. Indeed, in the wonderful Tel el-Amarna collection there is a suggestive absence of literary documents from the Aegean that demands a word of notice. The Tel el-Amarna collection, it will be recalled, consists of the royal archives of King Amenophis IV. of the XVIIIth Egyptian dynasty, who in the latter years of his reign chose to be known as Khu-n-Aten, "the glory of the solar disc." This monarch had retired from Thebes and established his court on the site now known as Tel el-Amarna, where he founded the city which existed only during the brief period of thirty years ending with the death of the monarch about 1370 B.C. The date of the documents found in the royal library is, therefore, fixed within very narrow limits. The documents in question consist chiefly of letters, and constitute one of the most important of archæological finds. These letters came to the king from almost every part of Western Asia, including Palestine and Phœnicia, Babylonia, and Asia Minor. Strangely enough, all the letters are written in the Babylonian character, and most of them are in the Babylonian language. They afford, therefore, most striking evidence of a widespread diffusion of Babylonian culture. Incidentally they prove, to the utter confusion of a certain school of Bible critics, that the art of writing was familiarly known in Canaan, and that Egypt and Western Asia were in full literary connexion with one another, long before the time of the Exodus. Hence all the elaborate arguments based on the supposition that Moses probably could not write fall to the ground. On the other hand, the absence of letters from Mycenæ among the tablets of Tel el-Amarna must be regarded as at least suggestive. Seemingly the widespread Babylonian culture had not reached the Aegean peoples; yet these peoples cannot have been wholly ignorant of things with which commercial intercourse brought them in contact. The point is of no very great significance, however, since no one has pretended that the Western civilization compared with the Eastern in point of antiquity; and in any event, no amount of negative evidence weighs a grain in the balance against the positive evidence of the Cretan inscriptions.

In short, then, the researches of the archæologist are tending to reconstruct the primitive classical history; and here, as in the Orient, it is evident that historians of the earlier day were constantly blinded by a misconception as to the antiquity of civilization. Such a fruitage as that of Greek culture of the age of Pericles does not come to maturity without a long period of preparation. Here, as elsewhere, the laws of evolution hold, permitting no sudden stupendous leaps. But it required the arduous labours of the archæologist to prove a proposition that, once proven, seems self-evident.

*Archæology and the Evolution of Art.*

What is true of Greek civilization in general is specifically true of the flower of that civilization, Greek art. Whoever would see the story of the evolution of Greek art illustrated, should go to the British Museum and pass from the Egyptian Hall, with its grotesque colossi, to the Assyrian rooms, with their marvellous bas-reliefs, and then on to the Elgin Marbles from the Parthenon. In particular, the art treasures of the Assyrian collection should demand the closest scrutiny. In the Nineveh gallery, for example, where one finds collections of strange Assyrian books, the walls are flanked everywhere with bas-reliefs that come from some buried palace that once stored the literary treasures.

It appears that the kings of that far-off time and land were connoisseurs of art as well as patrons of literature; and the art treasures of their palaces certainly form the most striking, if not the most important, part of the mementoes they have left to us. The more closely these figures in low relief are examined, the more wonderful they will seem. They take the place of the Egyptian carvings in the round; and if they are less striking to first view than the great sarcophagi, the grotesque gods, and colossal animal forms of that people, they will prove infinitely more expressive and incomparably more artistic on closer inspection. For these flat sculptures depict, not alone gods and sacerdotal scenes, but everyday affairs and the events of Assyrian history. The bas-relief was clearly the focal point of Assyrian art. Even the great bulls and lions that guarded the palace entrances were only partially detached from their background, and a frescoed statue of King Assur-nazir-pal shows the same tendency. The full rounded statue was not indeed unknown to them, as several examples testify; but their real *forte* lay in mural decoration in low relief. And the particular walls on which the artists mainly expended their skill, if we may judge from what the ruins have revealed to us, were not the walls of temples but the palaces of kings. It is quite clear that these great conquerors of antiquity were very human, very like their successors of after times. They loved to have their heroic deeds, real or alleged, heralded to the world, and recalled incessantly to their own memories. So one finds whole histories epitomized on these walls,—wars, conquests, victories; the storming of cities, the slaughter of the enemy, the leading of captives, and bringing of tribute by subject people,—everything, in short, but Assyrian reverses; the court artist, true to his colours then as now, never made the mistake of depicting those.

As historical records these sculptures are of priceless value, both for what they tell of political history and for the light they throw on the powers and limitations of antique art. But before you venture to judge the Assyrian artist in the latter regard, you must pass on to the room of Assur-nazir-pal, and from that to the adjacent room, where the mural decorations of the dining-hall of the last of the great Assyrian kings, Assur-bani-pal, have been placed *in situ*, reproducing an effect which they first made in the palace at Nineveh in the 7th century B.C. Here you may see at once both another phase of royal life in Assyria and another stage of Assyrian art. Not war, but the chase is now the theme. King Assur-bani-pal is seen in pursuit of the goat, the wild ass, the lion. The king, of course, towers above his attendants, though not in the grotesque disproportion of the Egyptian paintings. To the Oriental mind such excessive stature seemed indissoluble from royal station. One recalls how the mother of Darius, made captive at Issus, mistook Hephæstion for the king, because he was taller than Alexander; and how Agesilaus, when he went to Egypt as an ally of the Egyptians, was held in contempt, despite his renown, because of his diminutive stature; and one cannot help wondering what would have been the real aspect of the Assyrian and Egyptian monarch could they have been subjected to the camera. Be that as it may, there was apparently no doubt in the mind of the court artist as to what his chisel should reveal in this respect, and the king may always be distinguished by his stature, without regard to his royal robes. Still, it is notable, as a distinction between Egyptian and Assyrian art, that the realistic eye of the Assyrian sculptor never let him depict the king as a Brobdingnag among the pigmies, after the Egyptian fashion. At the most he is a head taller than those about him.

The royal hunter pursues his quarry sometimes on foot, more usually standing in his chariot. His

weapon is usually the bow, sometimes the spear; on one occasion he grapples with the lion, hand to jowl, and stabs the quarry to the heart with a short sword. The quiet dignity and royal calm with which the feat is achieved must have ensured the artist a high and enduring place in the royal favour. The action, however, of the human figures in these sculptures is always sedate and reposeful, suggestive of reserved strength perhaps, or possibly of the artist's limitations. Whichever it is, the real power of the artist is not shown in the human figures. These, to be sure, are in part strongly anatomized; in the main, they are fairly proportioned, and, unlike the Egyptian figures, they have the shoulders drawn in proper perspective. But the faces are fixed, impassive; the eyes are not in perspective, and, as a whole, they cannot claim high merit as works of art, viewed from an abstract modern standpoint. Considered in relation to their time, they are wonderful enough, so far ahead are they of anything that we could suppose to have been accomplished in the world of that day. But they fall far short of the standard which the same artist has himself given us in animal figures of his composition. It seems as if the human figures might have been done from memory, whereas the animal forms are clearly enough from the natural model. Indeed, when we turn to these animal figures we may criticize them, not with reservation as to their age, but from the standpoint of modern art, and as individual figures they will not be found wanting. The three fundamental canons—"proportion, action, aspect"—have been successfully met. The lions skulk sullenly from their cages, spring furiously into action, or roll in death-agony at the will of the depicter. The lioness, with spine broken by an arrow, dragging her palsied hind-quarters, is a veritable masterpiece. The same is true of many of the figures of goats, of running and pacing wild asses, and of dogs. As a whole, these animal frescoes are nothing less than wonderful. It is worth a visit to London from the remotest land to see these sculptures from the palace of the old Assyrian king.

Still, though these bas-reliefs have intrinsic merits as works of art, their chief value is for what they teach regarding the evolution of art in the world. Previously to their discovery it had been supposed that the stiff formalism of Egyptian sculpture represented the fullest flight of pre-Grecian art; and that Greek art itself had stepped suddenly forth, rather a new creation than an evolution. But the pick and shovel of Layard at Nineveh dispelled that illusion. For these art treasures, that had lain there under the deposits of centuries, were found to represent an enormous advance upon Egyptian models, precisely in the direction of that realism for which Greek art is distinguished.

If we would judge how direct and unequivocal was the impulse which the dying nation transferred to the adolescent one in point of art, we have but to take a few steps in the British Museum, from the Assyrian rooms to the wonderful hall that holds Lord Elgin's trophies from the desecrated Parthenon. Look then upon the frieze of bas-relief that bears the magic name of Phidias. If anything can reconcile us to the act that deprived Greece of her priceless heirlooms, it is the fact that they have found lodgment here close beside their Oriental prototypes, where half a million visitors each year may at least have an opportunity to learn the lesson that human progress is an accretion, a growth, a building upon foundations; and, specifically, that Greek art, no less than other forms of human culture, was an evolution, and not an isolated miracle. For what is the Parthenon frieze, as we now come to it fresh from the palaces of Nineveh, but an Assyrian fresco adapted to the needs and ideals of another race and developed by the genius of a newer civilization? The profiled figures in low relief coursing together, are they different in conception from the profiled figures of the palaces we have just left? The horses of the Parthenon frieze might almost seem to have stepped bodily from the palaces of Assur-bani-pal. They have gained something in suppleness of limb, have altered their attitude in a measure, to be sure, thanks to their new environment. But their type has not changed by so much as an actual breed of horses might be changed in as many generations. Note the head, the most typical and characteristic feature of this Grecian steed. Line for line it is the same head, trappings aside, that we have just seen at Nineveh. Even the defects of the Assyrian drawing are there—the too small and slender face, and receding lower jaw, the tiny ear, the far too full and "chuffy" neck. Possibly no horse in nature was ever like this, but the Assyrian artist so conceives it; the Greek copies that conception; and the distorted type will be transmitted down

the generations to the Italian of the Renaissance, to the classical painters of Spain, the Netherlands, and Germany, and France; nay, even to the artist of the 19th century. The court artist of an Oriental prince of the 9th or 10th century B.C. conceives a certain ideal; and, following him, a certain type of sculptured horse, such as the artist who carved it has never seen, steps before the chariots on Napoleon's Arc de Triomphe, in 19th-century Paris.

We have only been able to indicate some of the most important of the issues raised by modern research. Enlightening as the results have been, they are even more striking as the promise of further investigation. At the opening of the Twentieth Century the field of inquiry stretched out on all sides, and the method of cultivating it for the profit of all mankind—since the true history of man on the earth must always be of the supremest interest to intelligent people—had been brought home to us by the new treasures already at our disposal. Strangely enough, there were still obstacles—pecuniary or political—to be faced by those expert archæologists who had best proved their title to support. But in the light of accomplished facts, it is not reasonable to suppose that a work so successfully begun will not be pushed forward further and further, till every available source of knowledge has been tapped.

# ENCYCLOPÆDIA BRITANNICA.

## NEW VOLUMES.

## CHICAGO.

**Chicago,** the second city in size in the United States, situated in Cook county, state of Illinois, in 41° 50′ N. lat. and 87° 34′ W. long. It stretches along the west shore of Lake Michigan for nearly 30 miles. The Chicago river, which empties into the lake, is about a mile long, being formed by the junction of branches from the north-west and south-west. The main river and the branches are an important part of the harbour, vessels being docked all along the banks. A series of breakwaters protect the mouth of the river from the lake storms and make a secure basin. The rivers divide the city into three divisions, the north, south, and west sides. The streets generally intersect at right angles. The total area of the city is 190½ square miles. There are 4074 miles of streets and alleys—1269·4 improved and 2804·6 unimproved. The extreme length of the city is 26½ miles and the extreme breadth 14½ miles. In 1880 the population numbered 503,185; in 1890, 1,099,850; and in 1900, 1,698,575. The native-born population (1900) was 1,111,463, and the foreign-born 587,112; the total coloured population was 31,435, of whom 30,150 were negroes, and the balance Chinese, Japanese, and Indians. Out of 511,048 males of voting age (21 years and over), 20,572 were illiterate (unable to write), of whom 19,336 were foreign-born. Of the total number of males of voting age, as given above, 237,688 were native-born and 273,360 were foreign-born. Of the latter number, 186,660 were naturalized, 10,398 had filed their first naturalization papers, 35,897 were aliens, and the citizenship of 40,405 was returned by the U.S. census enumerators as unknown. The number of births registered in 1900 was 29,568. The number registered is thought to be perhaps 80 per cent. of the total. The number of deaths in the census year ending 31st May 1900 was 27,533, showing a death-rate of 16·2 per thousand. In 1890 the death-rate was 19·1. As the number of births is only slightly in excess of the number of deaths, it is obvious that the growth of the city in population comes mainly from immigration.

*Railways.*—Chicago is one of the great railway centres in the United States. Trunk lines reach east to Montreal, Boston, New York, Philadelphia, Baltimore; south to Charleston, Savannah, Florida, Mobile, New Orleans, Texas; west to the Pacific by all the overland routes. Nearly all the traffic between the northern Atlantic seaboard and the Far West passes through Chicago, and the trade of the city extends in every direction. The Illinois and Michigan canal connects the Chicago river with the waters of the Mississippi for small craft, and it seems not unlikely that some day the new drainage canal will become a ship canal, thus making it possible for large vessels to ply between New Orleans and Chicago. Local transit is provided partly by the trunk railways, partly by four elevated railways, one on the south side, two on the west side, and one on the north side, all worked by electricity. The trams are operated by cables or electricity. The local lines, both elevated and tram, belong to private corporations which hold charters for a term of years from the city. One important effect of the abundant provision for local travel is seen in the concentration of business in the comparatively small area south of the main river and between the south branch and the lake. Another effect is the wide diffusion of the residential quarter, there being many areas within the city limits very sparsely built up. In consequence of the enormous value of land in the down-town district, the erection of very high buildings for business purposes has become imperative. The highest is the Masonic temple, which has 22 storeys, with a total height of 302 feet. The Monadnock, an office building, has no less than 6000 occupants, and constitutes a postal district by itself—as is the case, indeed, with other such buildings.

*Education.*—Education, as generally in the United States, is largely in the hands of the state, but is liberally supplemented by private effort, by corporations endowed from private munificence, and by church schools. Besides the usual primary, secondary, and higher institutions, there are technical and professional schools and a variety of

special bodies. In addition to institutions with a distinctly scholastic aim, there are libraries, museums, art galleries, and semi-public musical organizations. The free public-school system includes elementary schools, high schools, and a normal school. The following statistics are for the school year ending 30th June 1900:—

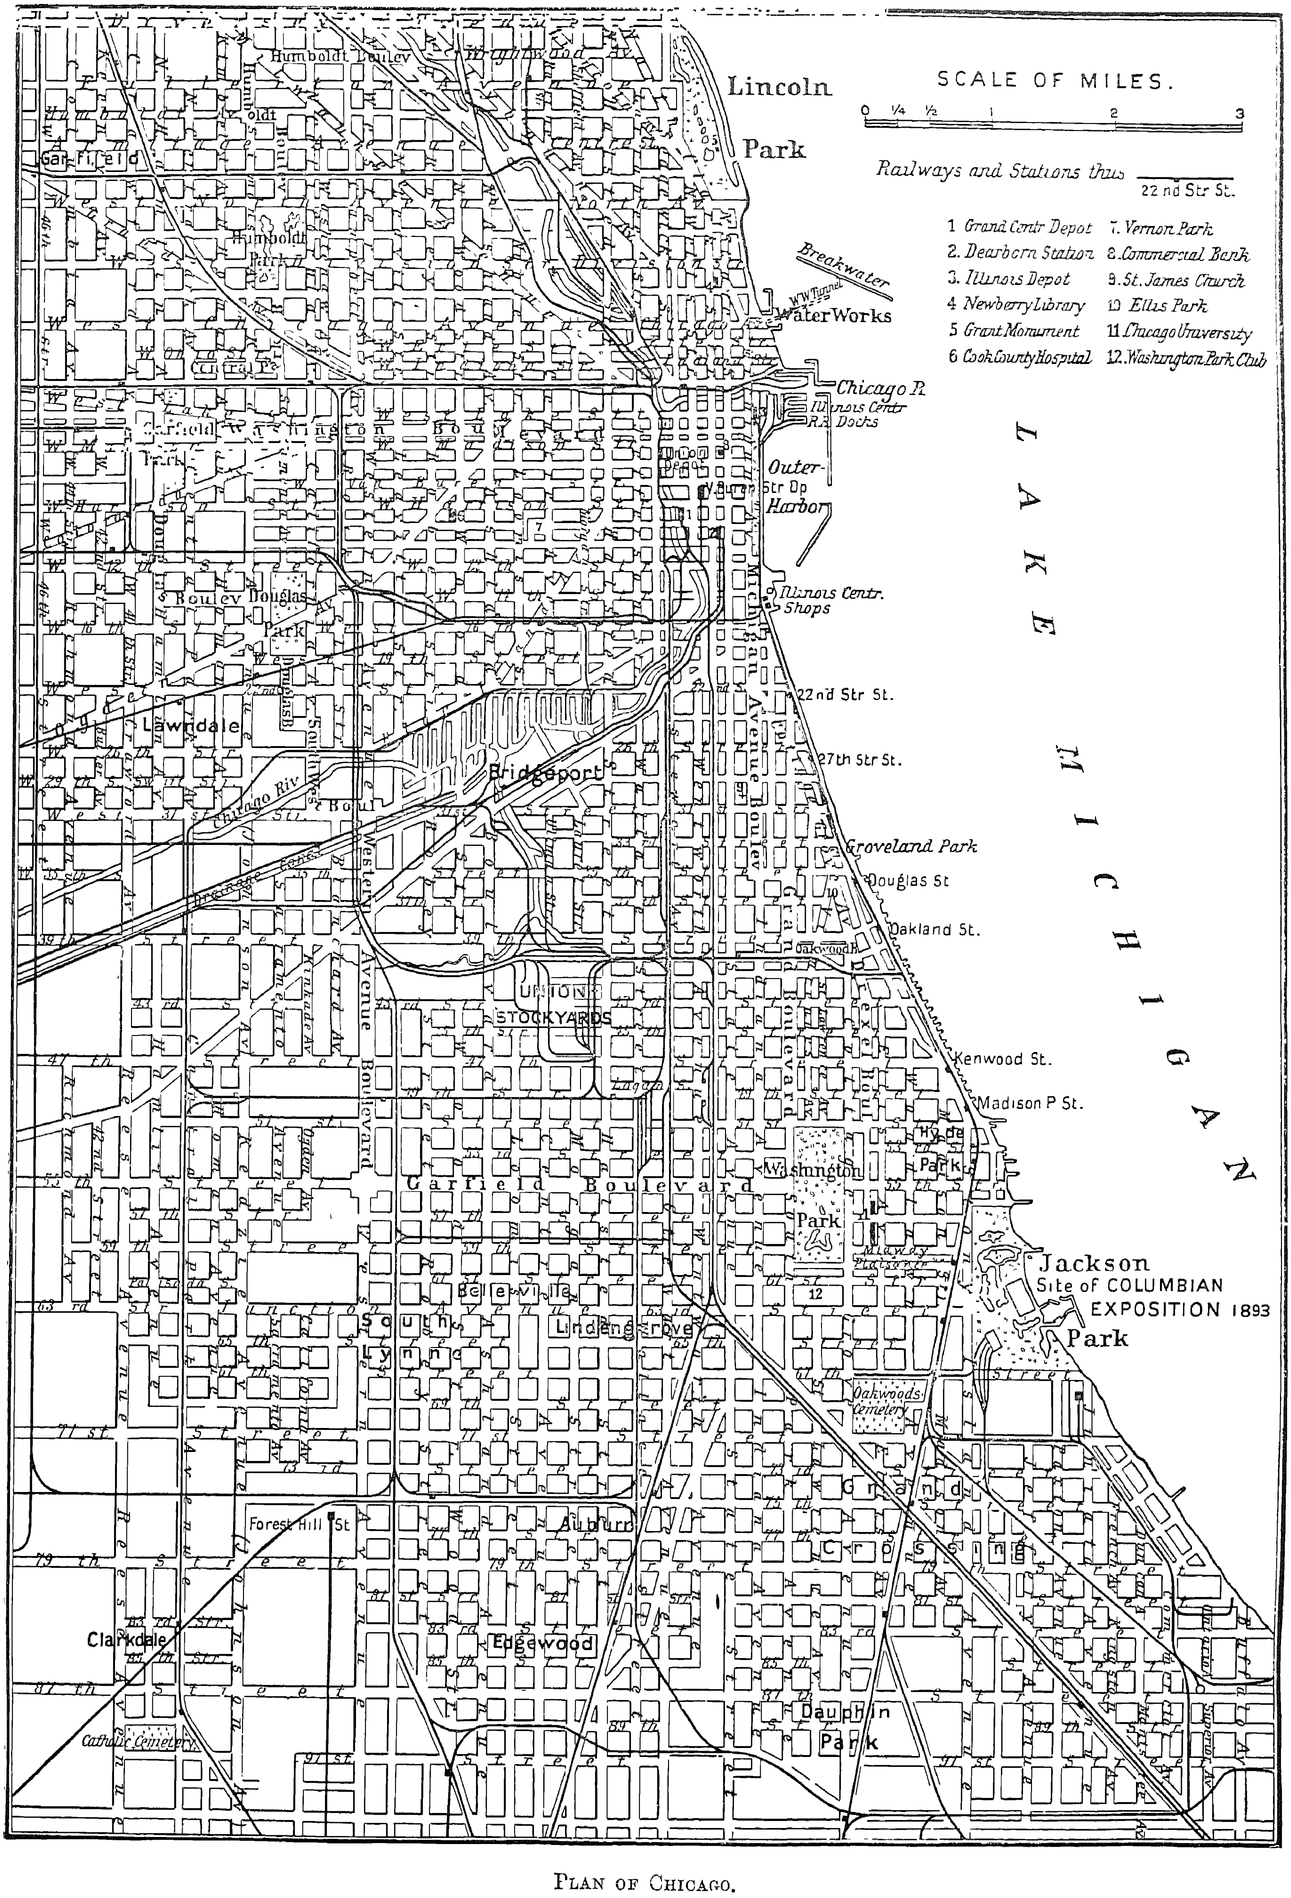
| | Number of Schools. | Number of Teachers. | Number of Pupils. |
|---|---|---|---|
| Elementary schools . | 130 | 5420 | 203,880 |
| High schools . . | 15 | 349 | 8,902 |
| Normal schools . . | 1 | 31 | 352 |
| Totals . . . | 146 | 5800 | 213,134 |

In 1900 there were 526,013 persons of school age (5 to 20 years).

The cost of the public schools for the year ending 30th June 1900 was $7,096,674. Of this sum $6,295,133 came from taxation and $801,541 from the income on invested funds. In 1898 the private schools had 323 teachers and 7625 pupils, and the parochial and church schools 1301 teachers and 78,989 pupils, exclusive of numerous kindergarten and business schools. There are three universities, situated wholly or in part in Chicago—Lake Forest University, North-Western University, and the University of Chicago. They were founded under Presbyterian, Methodist, and Baptist auspices respectively. The academic departments of the two former are in the suburbs of Lake Forest and Evanston, the professional departments being in Chicago. Lake Forest, for the year ending June 1900, had 126 students in the college at Lake Forest, 561 in the college of dental surgery, and 364 in the college of law—a total of 1051. North-Western University had an attendance, for the year ending June 1900, of 572 students in the college of liberal arts, 42 in the graduate school, 182 in theology, 211 in law, 413 in medicine, 235 in pharmacy, 566 in dentistry, and 292 in music, there being a total of 2358 (excluding repetitions). There were in the same departments 277 professors and instructors. The University of Chicago alluded to in the ninth edition of this work went out of existence in 1886. In 1890 a new institution of the same name (see separate heading below) was incorporated under the laws of Illinois, and was opened on 1st October 1892. Schools of law and medicine include those connected with the North-Western and Lake Forest Universities, the Rush Medical College (affiliated with the University of Chicago), the College of Physicians and Surgeons (the medical department of the University of Illinois), and several which are independent. Theological schools, besides those of the universities, are the M'Cormick Theological Seminary (Presbyterian), the Chicago Theological Seminary (Congregational), the Western Episcopal Theological Seminary, the German Lutheran Theological Seminary, and some others. The Lewis Institute, on the west side, and the Armour Institute of Technology, on the south side, both largely endowed, provide education in which technical instruction is prominent. The Chicago Institute, founded and endowed by Mrs Anita M'Cormick Blaine as an independent school for the training of teachers, is now a part of the University of Chicago. The Chicago Art Institute conducts an art school and maintains a collection of pictures, reproductions of sculpture and bronzes, and original Egyptian antiquities. The library, consisting of over 2000 volumes and 16,000 photographs, is used in connexion both with the school and with the museum. The building, which stands on the Lake Front Park and is the property of the city, cost a little over $700,000. Of this sum $200,000 was paid by the World's Columbian Exposition, and the rest by the institute and by gifts from its friends. The art school had 1904 students in 1899-1900. The collection of pictures contains excellent examples of the works of old and modern masters. The Field Columbian Museum occupies the building in Jackson Park which was the art gallery of the Columbian Exposition of 1893. The nucleus of the collection was in large gifts from exposition exhibitors, and many additions have been made since. Besides the libraries of the various institutions of learning, there are a public library and two endowed libraries, the Newberry and the Crerar. The public library has an annual appropriation of about $276,000 from the Common Council, and has 272,000 volumes on its shelves. The Newberry Library, on the north side, possesses an endowment fund of about $2,500,000, and has 230,000 volumes. It is especially rich in Americana. The John Crerar Library has an endowment fund of $3,500,000, an income (for 1900) of $157,285, and 70,406 books. This library is limited to books on science (including the social sciences). The library of the University of Chicago has 337,915 volumes, and that of the Chicago Law Institute (which is accommodated in the Court House) has upwards of 37,000 titles. The Chicago orchestra, mainly supported by voluntary contributions, is devoted to rendering classical music.

*Religion and Charity.*—There are in Chicago 775 churches, or parishes, representing 36 distinct ecclesiastical organizations. The Baptists have 60 parishes, the Congregationalists 83, the Episcopalians 42, the Lutherans 87, the Methodist Episcopalians 145, the Presbyterians 48, and the Roman Catholics 118. There are also upwards of a hundred missions maintained by the various churches. There are 45 hospitals and several infirmaries and dispensaries in the city. The Cook County Hospital belongs to the county. The others are in the main supported by churches or by private benevolence. Provision is made for indigent patients as well as for those who are able to pay for treatment. There are 55 asylums and homes for the destitute, for orphans, for the aged, the erring, for those afflicted with incurable disease, for the friendless, and the like. Of these the Cook County Insane Asylum and the Cook County Poor House belong to the public. The rest, like the hospitals, are supported by churches or by private benevolence. Chicago has its full share of temporary distress, of habitual mendicancy, of economic inefficiency, of vicious poverty. The city is, however, well equipped with the customary institutions for dealing with such cases. Moreover, to prevent the overlapping of charitable work, and also as a precaution against fraud, there has been organized since the World's Fair the bureau of charities. For this purpose the city is divided into districts, in each of which there is a local organization, under the general direction of a central committee. All cases are registered, new cases being examined in detail. Nearly 50,000 family records are on file in the bureau registration. During 1899, 11,274 applications were made for the services of the bureau. About 25 per cent. of these were sent to the bureau for investigation by co-operating agencies.

*Commerce and Industry.*—Chicago is a centre of manufacturing and commerce on the largest scale. Among the leading industries may be enumerated meat-packing, agricultural implements, railroad cars, printing, electrical apparatus, brewing, bicycles, pianos, mill machinery, and shipbuilding. Chicago is the greatest grain market in the world. Some idea of the extent of the industries of the city may be obtained from the following statistics for 1899. The receipts of live stock amounted to 14,623,435 head, valued at $233,711,180, and the shipments were 3,006,532 head. There were also shipped during the same



PLAN OF CHICAGO.

year 1,061,868,376 ℔ of dressed beef, 505,834,067 ℔ of lard, 203,454 barrels of pork, and 863,363,437 ℔ of other hog products. The receipts of sheep were 3,682,832. The Union stock-yards include 475 acres of land, of which 320 acres are floored with planks or brick. Within the yards are 13,000 pens, 8500 of which are covered, for housing hogs and sheep. These covered pens occupy 75 acres. There are also within the yards 25 miles of streets, 38 miles of water troughs, 90 miles of water pipes, and 50 miles of sewerage. The receipts of grain and of flour in the grain equivalent were 320,670,440 bushels, and the shipments were 246,369,099 bushels. The port of Chicago showed 8048 arrivals, with a tonnage of 6,281,355, and 8126 clearances, with a tonnage of 6,317,884. The duties collected on imported goods at the Chicago custom-house amounted to $7,551,400. The greater part of these imports came by rail in bond. The bank clearings were $6,612,311,611, as against $60,761,791,901 for New York, $7,086,285,271 for Boston, and $4,811,079,611 for Philadelphia. The gross receipts of the post office for the fiscal year ending 30th June 1899 were $6,131,123, as against $8,881,547 for New York, $3,143,929 for Philadelphia, and $2,920,383 for Boston.

*Government.*—The constitution of the state of Illinois forbids the legislature to grant special charters for municipal corporations, and requires that all such incorporations shall be in accordance with a general law. The government of Chicago, therefore, is framed by the statute which provides for all cities in the state alike. The city is divided into thirty-five wards. Each of these elects two members of the city council, one being chosen each year for a term of two years. Thus the council is a continuous body, one half of its seventy members being renewed annually. The powers of the council are very extensive, including the granting of franchises for the supplying of light and locomotion. The supreme executive officer is a mayor, elected by the qualified voters of the city for two years. Legislation requires his assent to be valid, unless a two-thirds vote of the council adopts the measure notwithstanding his veto. The mayor has large power of appointment and removal of officers, and it is his duty to enforce the laws. The administrative departments are organized in general on the plan of a single head for each, appointed by the mayor with the approval of the council, the subordinates being appointed by the head with the approval of the mayor. These departments are those of finance, law, public works, fire, police, health, and buildings. The department of education and the public library are administered by boards, whose members are appointed by the mayor with the approval of the council. The courts of law are courts of the state of Illinois, but a certain number of justices of the peace are designated by the mayor to act as police magistrates.

*Local Works.*—The *water supply* is derived from Lake Michigan, there being a series of pumping stations from one mile to five miles from the shore. The system belongs to the city, and is maintained and operated by the department of public works. The main *drainage* of the city has been into the lake. In order to preserve the lake water from pollution a drainage canal has been constructed from the south branch of the Chicago river to the Desplaines river, a total distance (including the improved portion of the river) of 34 miles. By this means the water flows from the lake into the Desplaines, and thence by way of the Illinois river into the Mississippi. The water was turned into the channel on 2nd January 1900. The present flow is limited to 360,000 cubic feet per minute, but the canal is designed to have a maximum capacity of 600,000 cubic feet per minute. The entire cost (1st January 1900) was $34,000,000. The cost is defrayed from taxes paid by the owners of property in the sanitary district, which includes the greater part of the city and certain suburban areas, a total of 185 square miles. The work is in the hands of a board of trustees elected by the people of the district.

*Parks.*—An extensive system of parks and connecting drives girdles the city from the shore of the lake on the north to the shore on the south. There are three distinct divisions of the system, known as the north, west, and south parks, each being managed by a board of trustees. The trustees of the north parks and those of the west parks are appointed by the governor of Illinois, while the south park trustees are appointed by the judges within Cook county. There are also several minor parks, which are controlled by the city government. The entire park area comprises 2232·1 acres—323·7 on the north side, 627·3 on the west side, and 1281·1 on the south side. Lincoln Park on the north side, and Jackson Park on the south side, are on the lake shore. The parks contain some interesting monuments—especially noteworthy being the bronze statue of Lincoln, the equestrian statue of Grant, and the memorials of Lassalle, Schiller, and Linnæus in Lincoln Park, and the equestrian statue of Logan in Lake Front Park. The monument dedicated to the Ottawa Indians, in Lincoln Park, and that commemorating the Indian massacre of 1812, are also of interest. In the Oakwoods cemetery is a monument to the memory of the Union soldiers of the Civil War, and also one to the memory of the Confederate soldiers who died while prisoners in Camp Douglas in the suburbs of Chicago between 1861 and 1865.

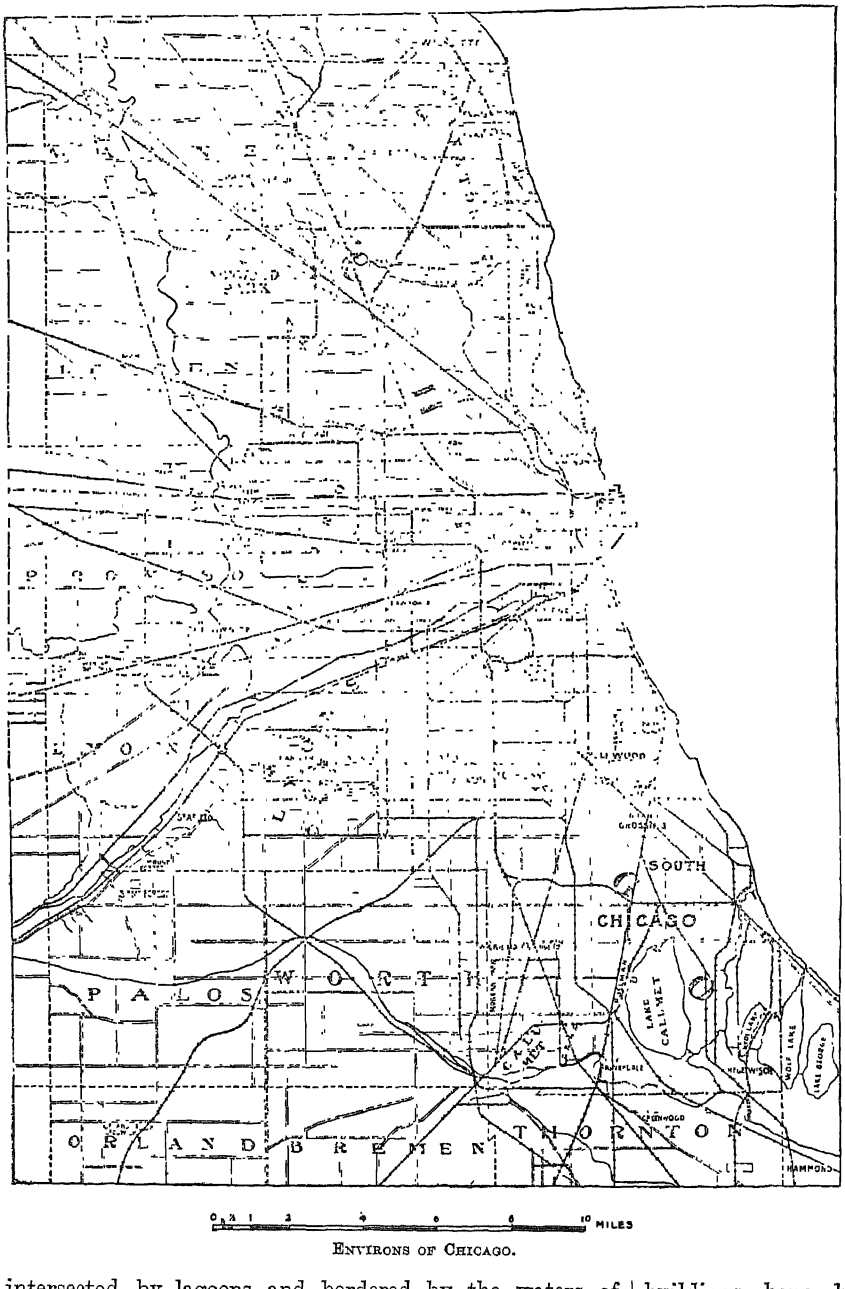
*Finance.*—The total receipts of the city for the fiscal year 1900 were $34,962,473. They were derived from taxation on real estate and on personal property, and from various other sources. The main items of the receipts, in addition to $2,956,734 cash on hand at beginning of the year, were—property tax, $14,295,829; liquor licenses, $3,174,003; other licenses, $538,092; special assessments, $3,246,124; water-works, $3,292,759; loans, $5,138,000.

The total expenditures for the year were $28,733,848, of which the expenditures for construction and other capital outlay amounted to $9,215,772, and those for maintenance and operation to $19,518,076. The main items of the former class of expenditures were—schools, $608,109; streets, $898,699; and loans repaid, $6,060,511. The main items of the latter class were—police department, $3,773,423; fire department, $1,617,225; schools, $6,200,433; parks and gardens, $643,089; street cleaning and sprinkling, $588,662; water-works, $1,240,001; and interest on debt, $1,313,916. The assessed valuation of real property in 1900, on a basis of about 20 per cent. of the full value, was $202,884,012; of personal property, on the same basis, $73,681,868. The general tax-rate was $74·87 per $1000. The net debt was $32,989,819.

By an anomaly in the laws, the rural towns over which the city has extended retain their political structure and some of their functions. It is also true that the dual system of city and county government—the city area paying nine-tenths of the city taxes—is clumsy and burdensome. The rapid growth of the city makes it necessary to provide public improvements on a large scale, and under the laws of the state the income heretofore has been insufficient to cover necessary expenses. How to provide an adequate income without an excessive burden on taxpayers, and without incurring a crushing debt, is one of the grave problems of the near future.

*The World's Fair, 1893.*—The four-hundredth anniversary of the discovery of America was commemorated

by a World's Fair at Chicago (see article EXHIBITIONS). The site was at Jackson Park, on the lake shore, and included 666 acres. On 21st October 1892 (corresponding to 12th October, o.s.), the date of the discovery, occurred the formal dedication of the grounds. The fair was opened on 1st May 1893, and was continued until 15th November. The buildings, planned by a commission of architects, formed a collection of rare beauty, while the grounds, intersected by lagoons and bordered by the waters of the lake, gave an appropriate setting. The principal nations of the world, and nearly all the states of the Union, had appropriate buildings, and the exhibits were on an extensive scale. A notable feature was the series of congresses on important subjects, of which the parliament of religions was perhaps the most successful. The total number of paid admissions was 27,529,401. Two permanent results of the fair remain in Chicago. The Field Columbian Museum found the nucleus of its great collection in many exhibits which were presented to it. The Chicago Art Institute was given by the World's Fair board $200,000 towards the permanent building on the lake front, used during the fair as a place of meeting for the various congresses.



ENVIRONS OF CHICAGO.

*Municipal Reform.*—In the spring of 1893 the Civic Federation was organized by a number of public-spirited citizens, and through that agency, as well as by other means, much has been accomplished in the direction of giving Chicago better government and better civic conditions. In 1895 the state adopted a municipal civil service law, which might be put in force by any city on affirmative vote of the people. It was ratified in Chicago by a majority of over 50,000. Later an improved revenue law and a law for the protection of primary elections have been enacted. All these measures were secured by the efforts of Chicago reformers. In 1896 the Municipal Voters' League was organized. This body has devoted itself to securing a better common council. The league examines and publishes the record of each candidate, no matter by what party nominated, and recommends election or defeat, as the case may be. As a result the council has been largely redeemed from the corrupt element which at one time controlled it.

(H. P. J.)

**Chicago, University of,** situated at Chicago, Ill., U.S.A., was founded by John D. Rockefeller, and opened its doors in October 1892. In 1899-1900 it had 223 teachers and 3183 students. It occupies eight blocks in the city of Chicago, upon which seventeen stone buildings have been erected; seven additional ones are now being built. The library contains 305,000 volumes. The value of grounds, buildings, and equipment is nearly $4,000,000, and the invested funds approximate $6,500,000. The only professional school is in divinity, but fully one-third of the students are engaged in graduate work in arts, literature, and science. The university extension division is important, and the university press publishes twelve scientific periodicals. By a system of affiliation close relationship is sustained with a number of colleges and secondary schools. Students of both sexes are admitted on equal terms. The Yerkes observatory of

the university, which contains the largest telescope in the world, is situated on Lake Geneva in Wisconsin, 60 miles from Chicago. (W. R. H.)

**Chicago Heights,** a village of Cook county, Illinois, U.S.A., a few miles S. of Chicago, of which it is a suburb. Population (1900), 5100, of whom 1530 were foreign-born and 47 were negroes.

**Chichester,** an ancient Roman city and municipal borough in the Chichester parliamentary division of Sussex, England, about 14 miles N.E. of Portsmouth by rail. In 1897 a tramway to Selsey Beach was completed, and the town was thoroughly drained in 1894 at a cost of £33,000. The restoration of the cathedral, which was commenced in 1830, is still in progress, the cloisters being the portions most recently restored (1890-91). The city and borough has been twice extended, and in 1901 had an area of 1595 acres. Population (1881), 8149; (1901), 12,241

**Chickamauga Creek,** a small branch of Tennessee river, joining it about 6 miles above Chattanooga. It gave the name to a desperate battle during the Civil War, fought on 19th and 20th September 1863, between the Federal forces under Rosecrans and the Confederates under Bragg; and after terrible fighting Rosecrans was repulsed. The Union loss was reported at 16,000, that of the Confederates 18,000. The site of this battle has been converted into a national park by the general Government.

**Chicopee,** a city of Hampden county, Massachusetts, U.S.A., situated in 42° 10′ N. lat. and 72° 31′ W. long., on Connecticut river, which is here not navigable, and on the Boston and Maine railway, 6 miles N. of Springfield. It was chartered as a city in 1890, with an area of 26 square miles of level surface, in which there are the three villages of Chicopee Center, Chicopee Falls, and Willimansett. It has fine water-power in Chicopee river, which joins the Connecticut within the city limits, and has extensive cotton mills and factories for iron and steel goods, especially for bicycles, arms, cutlery, and agricultural tools. Population (1880), 11,286; (1890), 14,050; (1900), 19,167, of whom 8139 were foreign-born and 10 were negroes.

**Chidambaram,** or CHELUMBRUM, a town of British India, in the South Arcot district of Madras, 7 miles from the coast and 151 miles S. of Madras by rail. The population in 1881 was 19,837, and in 1891 it was 18,634; the municipal income in 1897-98 was Rs.23,690. Its temples are among the most famous in Southern India, and attract 60,000 pilgrims every December. The great temple has a court of 1000 pillars, each a solid block of granite, and its roof is covered with copper and gold. There are a high school and three printing-presses.

**Chieng Mai** (Burm. *Zimmê*), the capital of the Lao state of the same name and the residence of a Siamese high commissioner appointed from Bangkok. This official has jurisdiction over the neighbouring less important states of Lampun, Lakawn-Lampang, Pre, and Nan, each of which, like Chieng Mai itself, retains its hereditary chief, or *chao muang*, and other hereditary officers. The town, surrounded by the remains of long ineffectual fortifications, is situated on the right bank of the river Meping, one of the chief branches of the Menam, in E. long. 99° 0′ and N. lat. 18° 46′, in a plain about 800 feet above sea-level, and surrounded by densely forested hill ranges. The population of the town consists chiefly of Lao, with a number of Chinese, Siamese, Shâns, and Ka hillmen, and about fifty Europeans, and numbers from 12,000 to 15,000. The place is growing fast, and a considerable population, probably over 100,000 in number, inhabits the plain in the neighbourhood of the capital. Situated as it is, midway between Moulmein and Yunnan and between the valley of the Menam and the northern Shân states, it has long been of commercial importance; while as the centre of the principal teak forests of Siam it has since 1880 attracted a considerable number of British, Shân, and Burmese foresters. By the treaty of 3rd September 1883 between Siam and Great Britain a British consul resides at Chieng Mai, and an International Court has been constituted, with civil and criminal jurisdiction in all cases in which British subjects are parties. Surveys have been made for railways from both Bangkok (500 miles) and Moulmein (230 miles). The total value of the annual import and export trade with Burma, China, and Bangkok of the consular district of Chieng Mai, is approximately £1,000,000 sterling, excluding teak. The output of teak will probably be somewhat restricted by the conservancy regulations enforced by the Siamese Forest Department.

**Chihuahua,** a state of Mexico, bounded on the N. by the United States, on the W. by Sonora, on the E. by Coahuila, and on the S. by Sonora, Sinaloa, and Durango. It has an area of 87,820 square miles. The population in 1879 was 225,541, and in 1895 it was 262,771, or 3·0 per square mile. It is divided politically into eighteen departments. Mining and stock-raising are the principal industries, though the agricultural interests are also considerable. The state contains some 200 towns and villages. The exports are principally gold and silver, lead, copper, cattle, sheep, and hides. It is estimated that $90,000,000 (gold) represents the American capital invested in mining. The value of the agricultural products in 1896 was $2,381,565. The capital, CHIHUAHUA, had a population in 1895 of 18,279, and an estimated one in 1898 of 24,000. It is on the Mexican Central railway, 226 miles south of El Paso (Texas) and 6400 feet above sea-level. It is lighted by electricity, has tramways and good sewerage. The principal public buildings are the cathedral, the state palace, and the Hospital Porfirio Diaz. Other important towns are Parral (7269), Ciudad Juarez (6917), and Jimenez (5381).

**Chilas,** an insignificant hill village, dominated by a fort, on the left bank of the Indus, about 50 miles below Bunji. It is situated in 35° 27′ N. lat. and 34° 8′ E. long., 4100 feet above sea-level. It was occupied by a British force early in 1893, when a determined attack was made on the place by the Kohistanis from the Indus valley districts to the south-west, aided by contingents from Darel and Tangir west of Gilgit and north of the Indus. Its importance consists in its position with reference to the Kashmir-Gilgit route *viâ* Astor, which it flanks. It is now connected with Bunji by a metalled road. Chilas is also important from its command of a much shorter and more direct route to Gilgit from the Punjab frontier than that of Kashmir and the Burzil pass. By the Kashmir route Gilgit is 400 miles from the rail-head at Rawal Pindi. By the Khagán route it would be brought 100 miles nearer, but the unsettled condition of the country through which the road passes is at present a bar to its general use.

**Child, Francis James** (1825-1896), American scholar and educationalist, was born in Boston, 1st February 1825. He graduated at Harvard University in 1846, taking the highest rank in his class in all subjects; at once became tutor in mathematics (1846-48); and in 1848 was transferred to a tutorship in history, political economy, and English, serving in that capacity for one

year. After two years of study in Europe, in 1851 he succeeded Edward T. Channing, who had helped to shape the style of so many Harvard authors during his occupancy of the chair of the Boylston professorship of rhetoric and oratory. He studied the English drama (having edited *Four Old Plays* in 1848) and Germanic philology, the latter at Berlin and Göttingen during a leave of absence, 1849-51; and took general editorial supervision of a large collection of the British poets, published in Boston in 1853 and following years. Spenser was newly and thoroughly edited, with life and notes, by him. At one time he planned an edition of Chaucer in the same series, but contented himself with a treatise, in the Memoirs of the American Academy of Arts and Sciences for 1863, entitled *Observations on the Language of Chaucer's Canterbury Tales*, which did much to establish Chaucerian grammar, pronunciation, and scansion as now generally understood. His largest undertaking, however, grew out of an original collection, in his British Poets series, of *English and Scottish Ballads*, selected and edited by himself, in eight volumes (Boston, 1857-59). Thenceforward the leisure of his life—much increased by his transfer, in 1876, to the professorship of English—was devoted to the comparative study of British vernacular ballads. He accumulated, in the university library, one of the largest folk-lore collections in existence, studied manuscript rather than printed sources, and carried his investigations into the ballads of all other tongues, meanwhile giving a sedulous but conservative hearing to popular versions still surviving. At length his final collection was put to press, as *The English and Scottish Popular Ballads*, at first issued in parts (1882-98), and then gathered into five folio volumes, which remain the authoritative treasury of their subject. Professor Child worked—and overworked—to the last, dying in Boston, 11th September 1896, having completed his task save for a general introduction and bibliography. A full and sympathetic biography was prefixed to the work by his pupil and successor George L. Kittredge.

**Childers, Hugh Culling Eardley** (1827-1896), British statesman, was born in London on 25th June 1827. On leaving Cambridge he went out to Australia (1850), and became a member of the Government of Victoria, but in 1857 returned to England as Agent-General of the colony. Entering Parliament in 1860 as Liberal member for Pontefract (a seat that he continued to hold till 1885), he became Civil Lord of the Treasury in 1864, and in 1865 Financial Secretary to the Treasury. A devoted admirer of Gladstone, Childers occupied a succession of prominent posts in the various Gladstone Ministries. He was First Lord of the Admiralty from 1868 to 1871, and as such inaugurated a policy of retrenchment. Ill-health compelled his resignation of office in 1871, but next year he returned to the Ministry as Chancellor of the Duchy of Lancaster. From 1880 to 1882 he was Secretary for War, a post he accepted somewhat unwillingly; and in that position he had to bear the responsibility for the reforms which were introduced into the War Office under the parsimonious conditions which were then part of the Liberal creed. During his term of office the Egyptian war occurred, in which Childers acted with creditable energy; and also the Boer war, in which he and his colleagues showed to less advantage. From 1882 to 1885 he was Chancellor of the Exchequer, and the beer and spirit duty in his budget of the latter year was the occasion of the Government's fall. Defeated at the general election at Pontefract, he was returned as a Home Ruler (one of the few Liberals who adopted this policy before Mr Gladstone's conversion) in 1886 for South Edinburgh, and was Home Secretary in the Ministry of 1886. When the first Home Rule Bill was introduced he demurred privately to its financial clauses, and their withdrawal was largely due to his threat of resignation. He retired from Parliament in 1892, and died on 29th January 1896, his last piece of work being the drafting of a report for the Royal Commission on Irish Financial Relations, of which he was chairman. Childers was a capable and industrious administrator of the old Liberal school, and he did his best, in the political conditions then prevailing, to improve the naval and military administration while he was at the Admiralty and War Office. His own bent was towards finance, but no striking reform will be associated with his name. His most ambitious effort was his attempt to effect a conversion of Consols in 1884, but the scheme proved a failure, though it paved the way for the subsequent conversion by Mr Goschen in 1888. The *Life* of Mr Childers, published by Murray in 1901, throws some interesting side-lights on the inner history of more than one Gladstonian Cabinet.

**Children, Cruelty to.**—English law has always in theory given to children the same remedies as to adults for ill-usage, whether by their parents or by others, and has never recognized the *patria potestas* as known to earlier Roman law; and while powers of discipline and chastisement have been recognized as necessarily incident to paternal authority, the father is civilly liable to his children for wrongs done to them. The only points in which infancy created a defect in civil status were that infants were subject to the restraints on complete freedom of action involved in their being in the legal custody of the father, and that it was and is lawful for parents, guardians, employers, and teachers to inflict corporal punishment proportioned in amount and severity to the nature of the fault committed and the age and mental capacity of the child punished. But the Court of Chancery, in delegated exercise of the authority of the sovereign as *parens patriæ*, has always asserted the right to take from parents, and if necessary itself to assume the wardship of children where parental rights were abused or serious cruelty was inflicted; while abuse of the power of correction is regarded as giving a cause of action or prosecution for assault; and if attended by fatal results renders the parent liable to indictment for murder or manslaughter.

The conception of what constitutes cruelty to children has undoubtedly changed considerably with the relaxation of the accepted standard of severity in domestic or scholastic discipline and the growth of new ideas as to the duties of parents to children, which in their latest developments tend enormously to enlarge the parental duties without any corresponding increase of filial obligations.

Starting from the earlier conception, which limited ill-treatment legally punishable to actual threats or blows, the common law came to recognize criminal liability in cases where persons, bound under duty or contract to supply necessaries to a child, unable by reason of its tender years to provide for itself, wilfully neglected to supply them, and thereby caused the death of the child or injury to its health, although no actual assault had been committed. Questions have from time to time arisen as to what could be regarded as necessary within this rule; and quite apart from legislation, popular opinion has influenced courts of justice in requiring more from parents and employers than used to be required. But Parliament has also intervened to punish abandonment or exposure of infants under two years (24 and 25 Vict. c. 100, § 27), and the neglect or ill-treatment of apprentices or

servants (24 and 25 Vict. c. 100, § 26; 38 and 39 Vict. c. 86, § 6); and by the Poor Law Amendment Act, 1868, parents were rendered *summarily* punishable who wilfully neglected to provide adequate food, clothing, medical aid, or lodging for their children under 14 in their custody, whereby the health of the child was or was likely to be seriously injured. This enactment made no express exception in favour of parents who had not sufficient means to do their duty without resort to the poor law, and was construed as imposing criminal liability on parents whose peculiar religious tenets caused them advisedly to refrain from calling in a doctor to a sick child.

But the chief gain in the direction of adequate protection of children prior to 1889 lay less in positive legal enactment on the subject than in the institution of an effective system of police, whereby it became possible to discover and repress cruelty punishable under the ordinary law. It is quite inaccurate to say that children had very few rights in England, or that animals were better protected. But before the constitution of the present police force, and in the absence of any proper system of public prosecution, it is undeniable that numberless cases of neglect and ill-treatment went unpunished and were treated as nobody's business. In 1889 a special statute was passed to prevent cruelty to children, which was superseded in 1894 by the Prevention of Cruelty to Children Act, which now regulates the matter and specifically deals with the offence of "cruelty" to children. This offence can only be committed by a person over 16 in respect of a child under 16 of whom he has "custody," "charge," or "care." The Act presumes that a child is in the custody of its parents, step-parents, or a person cohabiting with its parent, or of its guardians; that it is in the charge of a person to whom the parent has committed such charge (*e.g.*, a schoolmaster), and that it is in the care of a person who has actual possession or control of it. Cruelty is defined as consisting in assault, ill-treatment (falling short of actual assault), neglect, or abandonment of the child in a manner likely to cause *unnecessary* suffering or injury to health, including injury to or loss of sight, hearing, or limb, or any organ of the body or any mental derangement; and the act or omission must be wilful, *i.e.*, deliberate and intentional, and not merely accidental or inadvertent. Though medical aid is not specified, it has been decided that for a member of the sect of Peculiar People not to call in a doctor may amount to an offence under the Act. The offence may be punished either summarily or on indictment, and the offender may be sent to penal servitude if it is shown that he was pecuniarily interested in the death of the child, *e.g.*, by having taken out one of these pernicious policies permitted under the Friendly Societies Acts. By § 23 (2) parents may be guilty of cruelty by neglect if they fail to apply for poor relief for their children in the event of their inability otherwise to maintain them.

This enactment overlaps the common law and the statutes already mentioned. Its real efficacy lies in the main in the provisions which facilitate the taking of evidence of young children, in permitting boards of guardians to prosecute at the expense of the rates, and in permitting a constable on arresting the offender to take the child away from the accused, and the court of trial on conviction to transfer the custody of the child from the offender to some fit and willing person. The Act has been utilized with great zeal and on the whole with much discretion by various philanthropic societies, whose members make it their business to discover the ill-treated and neglected children of all classes in society.

Besides the provisions above indicated directly dealing with cruelty to children, there was during Queen Victoria's reign much legislation in the interests of children, requiring their parents to procure their elementary education, forbidding the employment of children under 10 in business or trade for gain (except in the case of children licensed by justices to perform in public), and restricting the employment of children of school age unless they have attained a certain standard of proficiency, which in practice prevents children under 13 from being put to work (the Elementary Education Act, 1876). The labour of boys under 12 underground in mines is forbidden. And where children may legally be employed in factories or shops limitations are imposed with respect to their hours of labour and other matters. The special legislation against the employment of children in agricultural gangs and in sweeping chimneys is virtually obsolete, owing to changes in the conditions of these occupations and the subsequent enactments above indicated.

The Act of 1894 also prohibits custodians, &c., of children from taking them, or letting them be, in the street to beg or receive alms, or to sing, play, perform, or sell in the street or in public-houses between 9 P.M. and 6 A.M. These provisions apply to boys under 14 and girls under 16. There are further prohibitions (1) on allowing children under 11 to perform, &c., for gain in public-houses or places of public amusement at any hour without a license from a justice, which is granted only as to children over 7 and under stringent conditions; (2) on allowing children under 16 to be trained as acrobats or for any dangerous performance except by their parents or legal guardians. (W. F. C.)

# CHILE.

*Geography and Statistics.*—Chile, or Chili, extends along the S.W. coast of South America, from the Peruvian frontier at 17° 57′ S. lat. to Cape Horn at 55° 59′ S. lat.; total area about 266,460 square miles. After controversies extending over many years, the boundaries have been within recent years settled by treaties concluded with Bolivia, Peru, and the Argentine Republic. Of Northern Chile, the portion extending from 23° S. lat. to the river Loa, comprising the province of Antofagasta, formerly belonged to Bolivia; it was occupied by Chile in accordance with the truce agreement of 4th April 1884, and was definitely ceded by Bolivia by treaty of 1st May 1896. The province of Tarapacá, extending from the river Loa northwards to the river Camarones, 19° 12′ S. lat., was formerly Peruvian. It was occupied by Chile in 1880, and was definitely relinquished by Peru by agreement of 28th March 1884. Between the Camarones and the Sama rivers lies the province of Tacna, consisting of the departments of Tacna and Arica. Under the treaty of 20th October 1883 this province was to be held by Chile for ten years, after which a popular vote was to decide whether it should be definitely incorporated with Chile or should revert to Peru, the country retaining it to pay a sum of 10,000,000 pesos to the other. In consequence of disagreement as to the manner of voting and the persons entitled to vote, no action was taken at the end of the ten years' term; and a convention, signed at Santiago on 16th April 1898, for the taking of the plebiscite was in 1900 rejected by the Chilian Congress.

***Boundaries.***

The coast of Chile, especially towards the south, is broken by islands. Opposite the province of Atacama is Easter or Pascua Island; facing the coast of Concepcion is the small island of Quirquina; farther south are Santa Maria and Mocha; more important are the Chiloé archipelago, consisting of about 96 islands, the Chonos archipelago with over 1000 islands, and, in the extreme south, the archipelago of which the most important islands are Tierra del Fuego, Desolation, Santa Ines, Clarence, Dawson, and Diego Ramirez islands. The island of Juan Fernandez is 390 miles west of Valparaiso.

*Population.*—The population of Chile, according to census enumerations from 1875 to 1895, is given as follows:—

| Year. | Population. | Increase. |
|---|---|---|
| 1875 | 2,075,971 | 256,748 |
| 1885 | 2,527,320 | 451,349 |
| 1895 | 2,712,145 | 184,825 |

For the purpose of comparison these figures are of little value. Prior to 1885 the provinces of Antofagasta, Tarapacá, and Tacna were not included, and the returns for 1885 are imperfect. The area of the provinces and their population, according to the census of 1885 and of 1895, with the population per square mile in 1895, are given as follows:—

| Provinces. | Area, Sq. Miles. | Population, 1885. | Population, 1895. | Pop. per Sq. Mile, 1895. |
|---|---|---|---|---|
| Magallanes Territory | 75,270 | 2,085 | 5,170 | 0·06 |
| Chiloé | 4,008 | 73,420 | 77,750 | 19·40 |
| Llanquihué | 7,820 | 62,809 | 78,315 | 10·01 |
| Valdivia | 8,313 | 50,938 | 60,687 | 7·30 |
| Cautin | 3,127 | 33,291 | 78,221 | 25·01 |
| Malleco | 2,856 | 59,492 | 98,032 | 34·29 |
| Bio-Bio | 4,157 | 101,768 | 88,749 | 21·35 |
| Arauco | 4,246 | 73,658 | 59,237 | 13·95 |
| Concepcion | 3,534 | 182,459 | 188,190 | 53·25 |
| Nuble | 3,555 | 149,871 | 152,935 | 43·02 |
| Maule | 2,930 | 124,145 | 119,791 | 40·88 |
| Linares | 3,488 | 110,652 | 101,858 | 29·20 |
| Talca | 3,677 | 133,472 | 128,961 | 35·07 |
| Curicó | 2,912 | 100,002 | 103,242 | 35·45 |
| Colchagua | 3,794 | 155,687 | 157,566 | 41·53 |
| O'Higgins | 2,523 | 87,641 | 85,277 | 33·80 |
| Santiago | 5,221 | 329,753 | 415,636 | 79·60 |
| Valparaiso | 1,659 | 203,320 | 220,756 | 13·30 |
| Aconcagua | 6,225 | 144,125 | 113,165 | 18·18 |
| Coquimbo | 12,869 | 176,344 | 160,898 | 12·50 |
| Atacamá | 28,371 | 76,566 | 59,713 | 2·10 |
| Antofagasta | 47,918 | 21,213 | 44,085 | 0·92 |
| Tarapacá | 19,300 | 45,086 | 89,751 | 4·65 |
| Tacna | 8,685 | 29,523 | 24,160 | 2·78 |
| Total | 266,458 | 2,527,320 | 2,712,145 | 10·18 |

It is estimated that in the enumeration of 1895, 10 per cent. of the population, or about 271,214, were omitted. The total population at the date of the census would therefore be 2,983,359. The population on 31st December 1898 was officially estimated at 3,082,178. The foreign population of Chile in 1885 was returned at 65,000; in 1895 at 72,812. Of the number in 1895, 42,105 were European, 29,687 were American, 1020 were from Asiatic and other countries. Of the Europeans 8269 were Spanish, 7809 were French, 7587 Italian, 7049 German, 6241 British, 1570 Swiss, 1490 Austro-Hungarian.

The marriages, births, and deaths registered in the 277 registration circumscriptions in 1897 and 1898 were:—

| | 1897. | 1898. |
|---|---|---|
| Marriages | 13,454 | 13,921 |
| Births | 109,057 | 104,536 |
| Deaths | 88,456 | 83,919 |

The civil marriage law of 10th January 1884 and the civil registration law of 17th July 1884 came into force on 1st January 1885. The cost of registration is borne by the State. The registration of deaths is required before burial, so that it is fairly trustworthy; but the registration both of marriages and births is stated to be frequently eluded. The death-rate is high. In the cities of Santiago and Valparaiso it is stated to be little under 60 per 1000, the mortality among children being very great. With a view to remedy this evil an Act was passed in February 1896 making drainage compulsory in the centres of population. Immigration goes on under the care of colonization agencies, which in 1896 introduced 988 agricultural and 1114 industrial immigrants from Europe. In 1897 the total number introduced was 807. In 1898 the Government voted the sum of £46,300 to the assistance of immigration, and in 1899 £38,680 to the same purpose. The result, however, proved so unsatisfactory that the Government have discontinued their direct subsidies for the encouragement of immigration. The agricultural portion of Chile is in the south, where rain is almost incessant, the forest growth dense, and the labour of clearing a few acres out of all proportion to the profits. Moreover, roads are wanting, and there is no adequate protection for life and property against outlaws and other dangerous characters. The Government has therefore turned its attention to the improvement of existing settlements, and for this purpose a sum of money is provided in the budget of 1900. The enumerated population in 1895 consisted of 1,240,353 inhabitants of towns and 1,471,792 of rural districts. The principal cities and towns, with the census population of 1895 and the estimated population on 31st December 1898, are:—

| | 1895 | 1898. |
|---|---|---|
| Santiago | 256,413 | 311,704 |
| Valparaiso | 122,447 | 140,262 |
| Concepcion | 39,837 | 51,781 |
| Talca | 33,232 | 40,237 |
| Chillan | 28,738 | 32,769 |
| Iquique | 33,031 | 30,000 |
| Antofagasta | 13,530 | 16,795 |
| Curicó | 12,669 | 14,325 |
| Talcahuano | 10,431 | 14,284 |

**Constitution.** The political constitution of 1833 is, with some amendments, in force. The principal amendments were made by laws of 9th August 1888, 11th August 1890, 20th August 1890, 22nd December 1891, 7th July 1892. The Chamber of Deputies consists of members elected for three years directly by the registered electors of each department—one deputy for 30,000 inhabitants. The republic is divided into electoral districts and subdivided into sections of 150 inscriptions, the registers of which are kept by the municipal authorities. On the basis of the census returns of 1885, the number of deputies was fixed at ninety-four. Senators are similarly elected, but for six years, and they are chosen, not in departments, but in the provinces—one senator for every three deputies. For the Chamber of Deputies and for the Senate there are triennial elections, the Chamber being renewed entirely and the Senate to the extent of one-half every three years. For the Chamber and for the Senate the system of voting is cumulative. Senators and deputies are unpaid.

At the head of the executive power is the President of the Republic, chosen for five years indirectly by the nation, the electors being specially chosen by the provinces—three electors for each deputy. The election of the president takes place on 25th June of the last year of the presidential term, and the new president is inaugurated on 18th September following.

*Local Government.*—The Republic is divided into provinces, departments, and 282 municipal districts. Each municipal district has, by law of 22nd December 1891, a municipality or council of at least nine members chosen by popular election. At the sessions of the municipalities or councils the *intendentes*, governors, or sub-governors of the national government preside. In the municipal districts assemblies of electors are held under the presidency of the first mayor for the election of councillors, the sanctioning of the local budget or of local loans (which are limited in amount), and for other business. The total municipal revenues in 1896 amounted to 8,767,780 pesos, and the expenditure to 9,010,730 pesos. If the peso is taken at 1s. 6d., the revenues were equivalent to £657,580 and the expenditure to £675,800 sterling. The principal police force, the fiscal police, is maintained and commanded by the national government, but the municipal force is still under the control of the municipalities. In Tacna municipal administration is carried on conjointly by the political heads of the departments and by councils (juntas) of three members appointed for three years by the president of the republic. There is a similar system in the territory of Magallanes.

*Education.*—Public education is free (at the cost of the State), but not compulsory. It is directed by a council, at the head of which is the minister of public instruction. Higher and secondary education are given in the university and the national institute at Santiago, and in the provincial colleges or *liceos*. In 1899 there were 573 university degrees and diplomas conferred. Besides the State university, there is a Catholic university giving instruction

in theology, in law, and in mathematical and physical science. In 1899 the national institute had 1168 pupils. There are in Chile six clerical seminaries which receive a small government subvention. Three colleges for girls are maintained by the State, and many schools for girls receive subventions. There are, besides, normal, agricultural, technical, and commercial schools. The estimates for 1898 provided a sum of £150,000 for higher and secondary education. In 1899 there were in Chile 1403 public primary schools (435 for boys, 276 for girls, and 692 mixed), with 2299 teachers (748 male and 1551 female); the enrolled pupils numbered 115,535 (56,278 boys and 59,257 girls), and the average attendance 70,607 (33,746 boys and 36,861 girls). The cost of primary instruction was £156,000. There were also, in 1899, 445 private elementary schools (148 for boys, 50 for girls, and 247 mixed) with 26,294 enrolled pupils (15,885 boys and 10,409 girls). Private schools devoted solely to popular education are assisted by the State. The German colonies of Valdivia and Llanquihué have excellent schools.

*Crime.*—The penal establishments of Chile, 87 in number (including the two penitentiaries at Santiago and Talca), have been under direct government administration since 1891. On 1st January 1900 they contained 7051 criminals (6219 men and 832 women). The total number of prisoners they received during the year 1899 was 34,429, of whom 28,037 were male and 6392 female. In 1899, 432 boys were sent to the two correctional schools.

*Charity.*—In Chile there are numerous charitable institutions supported by endowments, legacies, donations, subscriptions, and government contributions. In 1897 State assistance was given to 79 hospitals to the amount of £65,000; to two lunatic asylums to the amount of £18,400; and to other institutions, £17,015. In Santiago in 1898 over £15,000 was spent in enlarging and improving the hospitals, but in many of the provinces the distress and poverty are very great, and the hospital accommodation is insufficient.

*Finance.*—The ordinary revenue and expenditure of Chile in 1892 and in the last four years were as follows (1 peso = 18d.):—

| Years | Revenue. | Expenditure. |
|---|---|---|
| | £ | £ |
| 1892 | 4,680,000 | 4,567,500 |
| 1896 | 6,099,600 | 6,271,000 |
| 1897 | 6,407,900 | 6,346,000 |
| 1898 | 6,635,300 | 6,579,500 |
| 1899 | 6,475,450 | 6,059,500 |

The estimated revenue and expenditure for 1900 were as follows (pesos at 18d.):—

| Revenue | | Expenditure. | |
|---|---|---|---|
| Ordinary— | £ | Ordinary— | £ |
| Export duties | 3,486,320 | Interior | 758,100 |
| Import duties | 1,537,500 | Finance | 1,531,680 |
| Railways | 937,500 | War, marine | 1,450,870 |
| Posts, telegraphs | 90,000 | Railways | 1,542,770 |
| Various | 333,750 | Justice, instruction | 793,960 |
| | | Various | 365,900 |
| Total | 6,385,070 | | |
| Extraordinary | 1,525,830 | Total | 6,443,280 |
| | | Extraordinary | 1,125,000 |
| Grand total | 7,910,900 | | |
| | | Grand total | 7,568,280 |

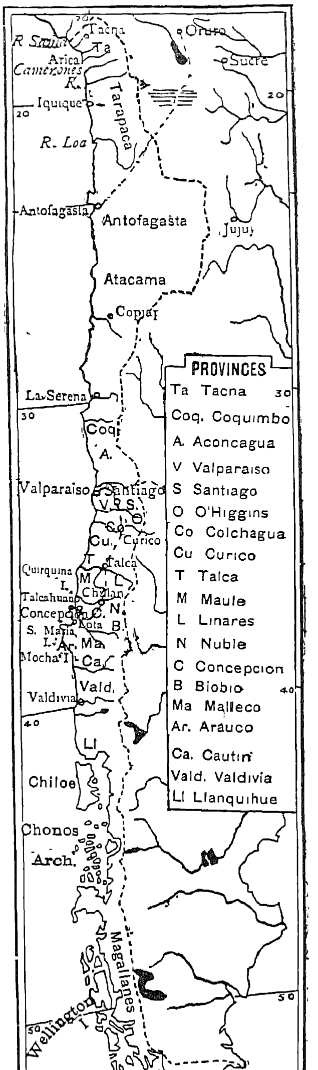
The export duties are levied mainly on nitrate and iodine.

Recent additions to the external debt of Chile have been incurred mainly for the satisfaction of claims arising out of the occupation of Peru, for railway construction, and other public works, and for the payment of floating and municipal debts. The internal debt consists of municipal debts, annuities ("censos"), a 3 per cent. debt, and the debt arising from the issue of notes under the law of 7th July 1898, amounting to 46,691,400 pesos. There is due also a balance on treasury bills discounted in London. The debt outstanding on 31st December 1899, and the debt charge were as follows:—

| Description of Debt. | Capital. | Charge. |
|---|---|---|
| External debt | £17,541,785 | £965,405 |
| Internal obligations— | | |
| Amount, 72,892,118 pesos | 5,466,908 | |
| Charge, 1,343,485 ,, | ... | 100,261 |
| Treasury bills, due in 1900 | 166,666 | 166,666 |
| Total | £23,175,359 | £1,232,332 |

To be set off against this debt is the value of government property, which (exclusive of government buildings) was estimated in 1897 to amount to 371,290,258 pesos or £27,846,800 sterling. A more recent estimate, based on actual prices, puts the value as follows in sterling: Nitrate fields, £3,000,000; guano deposits, £100,000; State railways, £12,000,000; State telegraphs, £50,000; State lands, £2,500,000; Talcahuano dock, £450,000; movable property, £80,000—total, £18,180,000.

The value of the real property held in 1896 by corporations was returned at 55,875,021 pesos (£4,190,630), and that held by private persons at 1,436,125,688 pesos (£107,709,430)—total, 1,492,000,709 pesos (£111,900,060). The mortgages on private estates amounted to 200,236,400 pesos (£15,018,730). In 1899, however, the price of land had fallen 30 or 40 per cent., so that the value of real estate in private ownership did not exceed 950,000,000 pesos (£71,250,000), while the mortgages had risen to 215,000,000 pesos (at par £16,125,000). The total value of real property (exclusive of government property) in 1899 may be put at about 1,000,000,000 pesos (£75,000,000 at par, or about £63,000,000 at the current rate of exchange).



SKETCH MAP OF CHILE.

*Defence.*—The army of Chile, according to the law of 24th November 1897, must not exceed 9000 men. The strength for 1900 was fixed at 5885, with 913 officers. This force is organized in 1 regiment (2 battalions) of coast artillery, 5 regiments of field artillery, 10 of infantry, 8 of cavalry, 1 corps of engineers (4 companies), 2 corps of pensioners, and the whole is distributed among the four military zones into which Chile is divided. For the last ten years German drill instructors have been employed; Mauser and Mannlicher rifles are used, and the batteries have Krupp guns of the newest type. By law of 12th February 1896 the National Guard consists of three branches—the active, comprising all citizens of 20 and 21 years of age; the passive, all over 21 years of age who have completed their service in the active; the sedentary, all from 30 to 40 years of age who are married. The total number in the National Guard is about 513,000, with 2400 officers. The Territorial Guard, numbering 19,862, organized in 1896 to defend the passes of the Andes, was disbanded in 1898. In Chile there are three military schools, a military museum, a cartridge factory, and other military establishments. The navy in 1899 consisted of 3 battleships, launched respectively in 1890, 1874, and 1865; 2 armoured cruisers; 2 second-class and 2 third-class cruisers; 11 gunvessels and gunboats; 4 destroyers, launched at Birkenhead in 1896, and all of a speed of more than 30 knots; 15 first-class and 4 second-class torpedo-boats. There are also training and school ships, and craft for special service. In order to reduce expenditure, several vessels were laid up in 1899. In 1898 the navy had 368 commissioned and staff officers and 3794 warrant officers and men. Naval schools were founded in 1893. A number of steamers of the South American Steamboat Company are subventioned and held at the disposal of the Government for transport service.

*Agriculture.*—The region most favourable for agriculture extends from Santiago to Concepcion, where large quantities of wheat are grown, and barley, maize, oats, and rye are also cultivated. Many industrial plants prosper in this region, notably the sugar beet, flax, colza, sorghum, hops, and tobacco. The grape thrives well, and nearly 15,000 acres are planted with vines. South of the agricultural region the climate is rainy, but the forest growth is luxuriant, and a great timber traffic is carried on. Stock-raising has considerable importance in Chile, more especially the rearing of sheep, vicuña, and hogs. The country is estimated to contain

about 3 million head of cattle and $3\frac{1}{2}$ million sheep, but there are no official statistics on the subject. About $1\frac{1}{2}$ millions of the population are dependent on agriculture, and the country produces annually some $28\frac{1}{2}$ million bushels of wheat and $8\frac{1}{2}$ million bushels of other cereals, apart from fruits, vegetables, &c. Bee-keeping has some importance in the south, the annual export of honey being about 2800 tons.

*Nitrate Production.*—By the acquisition of the provinces of Tarapacá and Antofagasta (1880-84) and the occupation of the province of Tacna, Chile obtained a vast addition to its mineral resources. The guano deposits lying on the coast of this region are nearly exhausted, but farther inland lies the nitrate zone, stretching, with a breadth of about three miles, from the Azapa valley in the province of Tacna, through the province of Tarapacá and into the desert of Atacamá, a total length of about 250 miles. In the provinces of Tarapacá and Antofagasta there are many refineries for purifying the crude [illegible], the centre of the industry being at Iquique.

The weight (metric tons) and value of nitrate of soda exported from 1879 onwards were as follows:—

| Years. | Tons. | Value. | Years. | Tons. | Value. |
|---|---|---|---|---|---|
| 1879 | 59,348 | £751,690 | 1889 | 921,380 | £5,771,220 |
| 1880 | 226,090 | 2,290,710 | 1890 | 1,026,290 | 5,950,470 |
| 1881 | 358,100 | 3,624,530 | 1891 | 891,720 | 5,174,500 |
| 1882 | 489,340 | 4,543,900 | 1892 | 797,820 | 5,030,630 |
| 1883 | 584,790 | 5,073,560 | 1893 | 947,020 | 6,208,650 |
| 1884 | 559,640 | 3,984,140 | 1894 | 1,081,330 | 7,018,680 |
| 1885 | 429,660 | 3,191,040 | 1895 | 1,220,420 | 7,208,680 |
| 1886 | 452,780 | 3,044,750 | 1896 | 1,111,750 | 6,955,850 |
| 1887 | 712,760 | 4,456,070 | 1897 | 1,057,630 | 5,928,290 |
| 1888 | 784,240 | 5,361,730 | 1898 | 1,294,220 | 6,800,650 |

The output for export in 1899 was estimated at 1,360,000 tons, worth about £9,375,000 at the prices quoted in October.

From the saline waters iodine is extracted in large quantities. The quantity of iodine exported in 1897 was 535,430 lb, and in 1898, 517,460 lb.

*Other Minerals.*—Copper is found in abundance, notably in the provinces of Taracapá, Antofagasta, Atacamá, Coquimbo, Aconcagua, Santiago, and Maule. In 1876 the quantity of bar copper exported reached 41,766 tons, and in 1878, 40,894 tons; but since then the output and the exportation have declined. During the eight years 1891-98 the export was as follows:—

| Years. | Tons. | Years. | Tons. |
|---|---|---|---|
| 1891 | 17,464 | 1895 | 20,042 |
| 1892 | 19,144 | 1896 | 20,592 |
| 1893 | 19,328 | 1897 | 19,011 |
| 1894 | 19,640 | 1898 | 20,600 |

Copper is exported in other forms in small quantities. In 1898, 3078 tons of copper ingots, 419 tons of copper and silver ingots, and 20,301 tons of copper ore were sent abroad. The production of copper in 1899 was estimated at 25,000 tons.

Gold and silver mining are carried on in various parts of Chile. Gold mining prospers at Taltal in the north, at several places in the central region, in the Magallanes territory, and in Tierra del Fuego. Rich alluvial deposits have been found at Lonquimai, in the province of Temuco, and the future output will probably show a large increase. The exact amount of silver produced is not easily ascertained, as the official statement includes a quantity of Bolivian silver passing through Chilian ports as if it were Chilian. The export of bar gold and silver from 1893 to 1898 was—

| Years. | Gold. Ounces. | Silver. Ounces. |
|---|---|---|
| 1893 | 24,224 | 4,512,850 |
| 1894 | 47,435 | 4,942,200 |
| 1895 | 38,082 | 4,782,210 |
| 1896 | 34,321 | 4,861,930 |
| 1897 | 36,383 | 4,614,850 |
| 1898 | 52,420 | 4,493,170 |

The value of gold exported in 1897 was £160,000, and of silver £540,000. Iron, manganese, lead, cobalt, nickel, zinc, bismuth are abundant in various provinces. The city of Coronel is the centre of the coal industry; in 1898 the coal output amounted to 282,600 tons.

The most important industries are connected with the mineral output. There are about 55 nitrate refineries in the nitrate district, the chief being at Lagunas; and there are works for the extraction of iodine. There are silver works at Playa Blanca; copper works at Lota, in Concepcion, and other places; sulphur works at Valparaiso, Santiago, and Concepcion. In Valdivia there are iron-foundries for the manufacture of saws and other tools for forest work. Other industries are distilling from native produce, brewing, flour-milling, and sugar-refining.

The distribution of the industries and the number of hands employed in the several groups are shown thus:—

| Localities. | Industries. | Number of Workers. |
|---|---|---|
| Northern Chile | Nitrate | 55,000 |
| North and Central Chile | Mining | 30,000 |
| Central and South Chile | Manufacturing | 44,704 |
| ,, ,, | Agricultural | 400,000 |
| ,, ,, | Stock-raising | 12,000 |

*Commerce.*—The annual value of the imports and exports, at intervals of five years from 1886 and in the years 1897-99, is shown in the subjoined table. Conversions have been made for years up to and including 1896 at the rate of 38d. to the peso, for 1897-99 at 18d. to the peso:—

| Years. | Imports. | Exports. |
|---|---|---|
| 1886 | £6,993,600 | £[illegible],113,100 |
| 1891 | 10,005,700 | 10,401,800 |
| 1896 | 11,729,800 | 11,773,500 |
| 1897 | 10,365,800 | 10,217,300 |
| 1898 | 7,669,700 | 12,605,200 |
| 1899 | 7,969,500 | 12,232,960 |

Of the imports in 1898, 71 per cent. in value, and of the exports 56 per cent. in value were subject to duty. The import duties amounted to £1,602,770; the export duties to £3,106,100. The most important article of export is nitrate, the value of the shipments of which amounted in 1886 to £3,044,760; in 1891, to £5,122,900; in 1896, to £6,955,900; in 1897, to £5,943,700; in 1898, to £6,800,650. The value of the iodine exported in 1891 was £671,342; in 1896, £326,790; in 1897, £384,617; in 1898, to £270,720. Of metals, the most important exports are copper in bars, amounting in 1886 to £1,296,18[illegible]; in 1891, to £771,600; in 1896, to £815,100; in 1897, to £893,780; in 1898, to £1,248,396. Bar silver was exported in 1886 to the value of £1,039,410; in 1891, £713,670; in 1896, £662,300; in 1897, £598,680; in 1898, to £523,986. Of agricultural produce the chief export is wheat, amounting in 1886 to the value of £773,360; in 1891, to £1,146,290; in 1896, to £653,450; in 1897, to £411,400; in 1898, to £575,234. The chief imports and exports in 1899 were as follows (conversion for both being made at 18d. to the peso):—

| Imports. | | Exports. | |
|---|---|---|---|
| Food articles | £1,327,250 | Mineral | £10,322,800 |
| Textiles | 2,179,350 | [illegible] | 794,850 |
| Raw materials | 1,626,700 | [illegible] | 289,650 |
| Watches, jewellery, &c. | 156,850 | Animals and animal products | 378,750 |
| Machinery, &c. | 952,130 | Wines, &c. | 24,946 |
| Domestic articles | 426,460 | | |
| Paper, &c. | 220,600 | | |
| Drugs, &c. | 126,800 | | |

Of the value of imports in 1899, 41 per cent. were from Great Britain, 28 per cent. from Germany, 8 per cent. from the United States. Of the exports, 67 per cent. in value went to Great Britain, 13 per cent. to Germany, 5 per cent. to France, 4 per cent. to the United States. Of the imports in 1899, 63 per cent. in value was landed at Valparaiso, 12 per cent. at Talcahuano, 10 per cent. at Iquique. Of the exports in 1899, 43 per cent. in value was shipped from Iquique, 11 per cent. from Valparaiso, 9 per cent. from Pisagua. During 1899 trade was hampered by the depreciation of the currency and the fluctuation in the exchange value of the peso consequent on the suspension of the conversion law.

*Shipping.*—In 1898, 7691 vessels of a total tonnage of 10,152,443 entered, and 7671 of 10,032,661 tons cleared. Of the vessels entered, 1923 of 3,167,579 tons, and of those cleared, 1831 of 2,944,209 tons were engaged in foreign trade. British vessels numbering 1004, with a total tonnage of 1,738,362, entered from, and 947 with a tonnage of 1,578,325 cleared for, ports outside of Chile. In the coasting trade 2057 British vessels with a tonnage of 3,164,515 entered, and 2081 of 2,246,230 tons cleared. In 1899, in the foreign and coasting trade, 7267 vessels of altogether 10,016,704 tons entered and 7154 of 9,738,769 tons cleared at the ports of Chile. At the end of 1899 the merchant marine of Chile consisted of 142 vessels with an aggregate tonnage of 71,214 tons, including 39 steamers with a total of 27,387 tons. Chile is in regular communication with other American countries and with Europe by Chilian, English, German, and French lines of steamers.

*Communications.*—Chile has about 43,500 miles of public highways, with 25,000 miles of less important roads, and the length of navigable rivers is put at 2800 miles.

The total extent of railway line within the republic in 1899 reached 2886 miles, of which 1458 miles belonged to the State and the remainder to companies. The projected trans-continental railway has been constructed on the Chilian side as far as Salto del Soldado, but 46 miles of line are still required to unite it with the Argentine section. The capital invested in the State railways up to the end of 1899 was approximately 85,907,165 pesos, which (at

18d. = 1 peso) would be equivalent to £6,443,440. The gross revenue in 1899 amounted to 13,997,799 pesos (£1,049,840) and the expenditure to 13,911,782 pesos (£1,043,280).

At Santiago there are 65 miles of tramway in process of conversion so as to be worked by electric traction. At Valparaiso the tramways are worked by horse-power.

*Post, Telegraph, and Telephone.*—In 1899 the Chilian post-office despatched 13,033,608 letters and post-cards, and 18,907,252 printed and other packets; the gross postal revenue amounted to 1,023,377 pesos (£76,750), and the expenditure to 1,065,612 pesos (£79,920). In the same year the State had 9970 miles of telegraph and telephone line, with 11,200 miles of wire, by which during the year 1,183,691 telegrams were sent and 17,831,234 conversations held, the total telegraph receipts having amounted to 613,003 pesos (£45,975). There were, besides, about 2610 miles of railway and private telegraph line. Telephonic communication has been established in all the principal towns, and two companies, one British, the other Chilian, furnish connexion between Santiago and Valparaiso, and between these cities and many smaller towns.

*Money and Credit.*—In Chile there are 23 joint-stock banks of issue, with an aggregate registered capital of 40,689,665 pesos (£3,051,720) and a note issue in July 1898 of 12,733,160 pesos (or, at par, £954,990). On 31st July 1898 the national government advanced to the banks notes amounting to 27,989,929 pesos (£2,099,240) at 2 per cent. interest per annum—the total note issue for which the banks were responsible being thus raised to 40,723,089 pesos (£3,054,230). In addition, the treasury put in circulation at the same date notes amounting to 17,693,890 pesos (£1,327,040), and is also responsible for notes for 1,193,641 pesos (£89,520), issued before 1896. There are four banks not banks of issue, and also 15 mortgage banks. The latter issue bonds on real property for, professedly, not more than half its value, and these bonds are sold in open market. The value in circulation in 1899 was officially stated to amount to 155,827,119 pesos (£11,687,030); but as the price of land has recently fallen, several estates having been sold at 40 per cent. of their nominal value, while large arrears of interest (probably not less than 3,000,000 pesos, or £225,000) are due to the banks, the condition of landed property seems unsatisfactory.

*Monetary System.*—The monetary unit of Chile is the uncoined gold peso. Under the law of 11th February 1895 the gold coins are the *condor* of 20 pesos, the *doblon* of 10 pesos, and the *escudo* of 5 pesos. All gold coins are eleven-twelfths fine. The doblon weighs 5·99103 grammes or 92·4536 grains. The gold peso is of the value of 18d., or 13⅓ pesos are equivalent to £1 sterling. The peso is equivalent also to 36½ United States cents. Under the same law silver coins are ·835 fine. The silver peso weighs 20 grammes or 308·64 grains, and the fractional coinage is of corresponding weight. By law of 10th January 1899, however, the coinage of fractional silver money only five-tenths fine to the amount of 5,000,000 pesos within two years was authorized.

Specie payments and the exchange of gold for silver by the mint resumed on 1st June 1895 were suspended by Act of 31st July 1898, which authorized the issue of 50,000,000 pesos in paper money with a forced circulation, and empowered the president to raise a loan of £4,000,000 sterling for the ultimate withdrawal of the notes. The immediate result was the withdrawal of gold and silver from circulation and a rapid fall in the value of the notes, which at the end of 1899 were still at a discount of 18 per cent. In 1901 the conversion scheme was postponed till October 1903.

*Weights and Measures.*—The metric system of weights and measures is the legal standard of Chile, but the old Spanish methods are still widely used, especially in reference to mining and farm produce. Nitrate of soda, even in official reports, is almost invariably calculated by the quintal (101·40 English pounds). In silver and copper mining the *marc* (8 ounces) is commonly used to express the richness of the metal. Farm produce is generally sold by the *arroba* or *fanega*, whilst the *vara* in lineal measurement, and the *cuadra* for indicating the superficial area of land, are customary amongst the country people.

(W. W. R.; C. E. A.)

*Political History since 1881.*—At the opening of 1881 the war between Chile and Peru had reached a stage when the final struggle was close at hand. On 13th January of that year the Chilian forces under command of General Baquedano attacked the entrenched positions of the Peruvians at daybreak in the vicinity of Chorillos, a village some few miles from Lima and forming the outer line of defence for the capital. The fight was a very severe one—the defenders, posted behind loop-holed mud walls, offering a most stubborn resistance to the advance of the invading army. The day ended in victory for the attacking forces, but with a loss of 800 killed and 2500 wounded; the Peruvian casualties were 5000 killed, 4000 wounded, and 2000 officers and men taken prisoners. On the following day negotiations for peace were attempted by the representatives of the foreign powers in Lima, the object being to avoid, if possible, any further bloodshed. This attempt to end the conflict proved, however, abortive, and on 15th January at 2 P.M. hostilities recommenced in the neighbourhood of Miraflores. After severe fighting for some four hours the Chilians again proved victorious, and drove the Peruvians from the second line of defence back upon the city of Lima. In this battle the invaders lost 500 men killed and 1625 wounded, the Peruvians about 3000 killed and wounded. Lima, the capital of Peru, was at the mercy of the Chilians after this last action, and on 17th January a division of 4000 men of all arms, under the command of General Cornelio Saavedra, was sent forward to occupy the Peruvian capital and restore order within the town limits. A portion of the Chilian forces was shortly afterwards withdrawn from Peru, and the army of occupation remaining in the conquered country was in charge of Admiral Patricio Lynch, an officer who had been specially promoted for distinguished services during the war. President Anibal Pinto of Chile now set about to find means to conclude a treaty of peace with Peru, but his efforts in this direction were frustrated by the armed resistance offered in the country districts to the Chilian authorities by the remainder of the Peruvian forces under command of General Cáceres. So matters continued—the Chilians administering on the seaboard and in the principal towns, the Peruvians maintaining a guerilla warfare in the mountainous districts of the interior. In September 1881 the term of office of President Pinto expired, and he was succeeded in the post of chief executive of Chile by President Domingo Santa Maria. Ex-President Pinto died three years later in Valparaiso, leaving a memory respected and admired by all political parties in his country. The name of Pinto will always occupy a prominent place in the annals of Chilian history, not only because the war with Peru took place during his term of office, but also on account of the fact that it was largely due to the intelligent direction of all details by the President during the struggle that the Chilian arms proved so absolutely successful by land and sea.

**Close of the war with Peru.**

Señor Domingo Santa Maria, who now acceded to the presidency of Chile, was a Liberal in politics, and had previously held various important posts under the Government. Under the rule of President Montt he had been

an active member of the Opposition and involved in various revolutionary conspiracies; for his participation in these plots he was at one time exiled from the country, but returned and received official employment under President Perez. The principal task confronting President Santa Maria on assuming the presidency was to negotiate a treaty of peace with Peru and provide for the evacuation of the Chilian army of occupation. The presence of the Peruvian General Cáceres and his forces in the interior of Peru prevented for some two years the formation of any Peruvian national administration in Lima with which the Chilian authorities could deal. In August of 1883 the Peruvians were defeated by the forces commanded by Admiral Lynch, and a Government was then organized under the leadership of General Iglesias. A provisional treaty of peace was then drawn up and signed by General Iglesias and the Chilian representative, and this was finally ratified by the Chilian and Peruvian Congresses respectively in April 1884. By the terms of this treaty Peru ceded to Chile unconditionally the province of Tarapacá, and the provinces of Tacna and Arica were placed under Chilian authority for the term of ten years, the inhabitants having then to decide by a general vote whether they remained a part of Chile or elected to belong once more to Peru. In the event of the decision being favourable to Peru a sum of 10,000,000 dollars was to be paid by Peru to Chile. On the ratification of this treaty the Chilian forces were immediately withdrawn from Lima and other points of occupation in Peruvian territory. The Government of Bolivia also attempted to negotiate a treaty of peace with Chile in 1884, and for this purpose sent representatives to Santiago. No satisfactory terms, however, could be arranged, and the negotiations ended in only an armistice being agreed to, by which Chile remained in occupation of the Bolivian seaboard pending a definite settlement at some future period.

*President Santa Maria.*

The administration of President Santa Maria met with violent opposition from the Conservatives, who included the Clerical party in their ranks, and also from a certain section of the Liberals. The dislike of the Conservatives to President Santa Maria was occasioned by his introduction of the law of civil marriage, the civil registration of births and deaths, and the freeing of the cemeteries. Hitherto no marriage was legal unless celebrated according to the rites of the Roman Catholic religion, and all registers of births and deaths were kept by the parish priests. Civil employees were now appointed under the new laws to attend to this work. Formerly the cemeteries were entirely under the control of the Church, and, with the exception of a few places specially created for the purpose, were reserved solely for the burial of Roman Catholics. Under the new régime these cemeteries were made common to the dead of all religions. Under President Perez, in 1865, a clause in the law of constitution had been introduced permitting the exercise of all creeds of religion, and this was now put into practice, all restrictions being removed. On several occasions, notably in 1882 and 1885, President Santa Maria used his influence in the elections of senators and deputies to Congress for the purpose of creating a substantial majority in his favour. He was induced to take this course in consequence of the violent opposition raised in the Chambers by the liberal policy he pursued in connexion with Church matters. This intervention caused great irritation amongst the Conservatives and dissentient Liberals, and the political situation on more than one occasion became so strained as to bring the country to the verge of armed revolution. No outbreak, however, took place, and in 1886 the five years of office for which President Santa Maria had been elected came to an end, and another Liberal, Señor Balmaceda, then succeeded to power.

The election of Balmaceda was bitterly opposed by the Conservatives and dissentient Liberals, but was finally successfully carried by the official influence exercised by President Santa Maria. On assuming office President Balmaceda endeavoured to bring about a reconciliation of all sections of the Liberal party in Congress and so form a solid majority to support the administration, and to this end he nominated as ministers representatives of the different political groups. Six months later the Cabinet was reorganized, and two most bitter opponents to the recent election of President Balmaceda were accorded portfolios. Believing that he had now secured the support of the majority in Congress on behalf of any measures he decided to put forward, the new President initiated a policy of heavy expenditure on public works, the building of schools, and the strengthening of the naval and military forces of the republic. Contracts were given out to the value of £6,000,000 for the construction of railways in the southern districts; some 10,000,000 dollars were expended in the erection of schools and colleges; three cruisers and two sea-going torpedo boats were added to the squadron; the construction of the naval port at Talcahuano was actively pushed forward; new armament was purchased for the infantry and artillery branches of the army, and heavy guns were acquired for the purpose of permanently and strongly fortifying the neighbourhoods of Valparaiso, Talcahuano, and Iquique. In itself this policy was not unreasonable, and in many ways extremely beneficial for the country. Unfortunately corruption crept into the expenditure of the large sums necessary to carry out this programme. Contracts were given by favour and not by merit, and the progress made in the construction of the new public works was far from satisfactory. The opposition in Congress to President Balmaceda began to increase rapidly towards the close of 1887, and further gained ground in 1888. In order to ensure a majority favourable to his views, the President threw the whole weight of his official influence into the elections for senators and deputies in 1888; but many of the members returned to the Chambers through this official influence joined the Opposition shortly after taking their seats. In 1889 Congress became distinctly hostile to the administration of President Balmaceda, and the political situation became grave, and at times threatened to involve the country in civil war. According to usage and custom in Chile, a ministry does not remain in office unless supported by a majority in the Chambers. Balmaceda now found himself in the impossible position of being unable to appoint any ministry that could control a majority in the Senate and Chamber of Deputies and at the same time be in accordance with his own views of the administration of public affairs. At this juncture the President assumed that the Constitution gave him the power of nominating and maintaining in office any ministers he might consider fitting persons for the purpose, and that Congress had no right of interference in the matter. The Chambers were now only waiting for a suitable opportunity to assert their authority. In 1890 it was stated that President Balmaceda had determined to nominate and cause to be elected as his successor at the expiration of his term of office in 1891 one of his own personal friends. This question of the election of another President brought matters to a head, and Congress refused to vote supplies to carry on the Government. To avoid trouble Balmaceda entered into a compromise with Congress, and agreed to nominate a ministry to their liking on condition that the supplies for 1890 were voted.

*Balmaceda elected President.*

This Cabinet, however, was of short duration, and resigned when the ministers understood the full amount of friction between the President and Congress. Balmaceda then nominated a ministry not in accord with the views of Congress, and, to prevent any expression of opinion upon his conduct in the matter, refrained from summoning an extraordinary session of the legislature for the discussion of the estimates of revenue and expenditure for 1891. When 1st January 1891 arrived, the President published a decree in the *Diario Oficial* to the effect that the budget of 1890 would be considered the official budget for 1891. This act was illegal and beyond the attributes of the executive power. As a protest against the action of President Balmaceda, the Vice-President of the Senate, Señor Waldo Silva, and the President of the Chamber of Deputies, Señor Ramon Barros Luco, issued a proclamation appointing Captain Jorje Montt in command of the squadron, and stating that the navy could not recognize the authority of Balmaceda so long as he did not administer public affairs in accordance with the constitutional law of Chile. The majority of the members of the Chambers sided with this movement, and on 7th January Señores Waldo Silva, Barros Luco, and a number of senators and deputies embarked on board the Chilian warship *Blanco Encalada*, sailing out of Valparaiso harbour and proceeding northwards to Tarapaca to organize armed resistance against the President. It was not alone this action of Balmaceda in connexion with Congress that brought about the revolution. He had alienated the sympathy of the aristocratic classes of Chile by his personal vanity and ambition. The oligarchy composed of the great landowners have always been an important factor in the political life of the republic; when President Balmaceda found that he was not a *persona grata* to this circle he determined to endeavour to govern without their support, and to bring into the administration a set of men who had no traditions and with whom his personality would be all-powerful. The Clerical influence was also thrown against him in consequence of his radical ideas in respect of Church matters.

*Outbreak of the revolution of 1891.*

Immediately on the outbreak of the revolution President Balmaceda published a decree declaring Montt and his companions to be traitors, and without delay organized an army of some 40,000 men for the suppression of the insurrectionary movement. Meanwhile the squadron under Montt had obtained possession of Iquique after some severe fighting, the garrison of that district offering a stout resistance to the landing of the rebel forces from the men-of-war. Tarapacá was the key of the position in Chile at this moment, the possession of that district and the port of Iquique meaning that money could be obtained freely from the export duties on nitrate of soda. A lull now occurred in the struggle while both sides were preparing for the final shock. President Balmaceda administered the government under dictatorial powers with a Congress of his own nomination. In June 1891 Balmaceda ordered the presidential election to be held, and Señor Claudio Vicuña was duly declared chosen as President of the republic for the term commencing in September 1891. The resources of Balmaceda were running short on account of the heavy military expenses, and he determined to dispose of the reserve of silver bullion accumulated in the vaults of the Casa de Moneda in accordance with the terms of the law for the conversion of the note issue. The silver was conveyed abroad in a British man-of-war, and disposed of partly for the purchase of a fast steamer to be fitted as an auxiliary cruiser and partly in payment for other kinds of war material.

The organization of the revolutionary forces went on slowly. Much difficulty was experienced in obtaining the necessary arms and ammunition. A supply of rifles was bought in the United States, and embarked on board the *Itata*, a Chilian vessel in the service of the rebels. The United States authorities refused to allow this steamer to leave San Diego, and a guard was stationed on the ship. The *Itata*, however, slipped away and made for the Chilian coast, carrying with her the representatives of the United States. A fast cruiser was immediately sent in pursuit, but only succeeded in overhauling the rebel ship after she was at her destination. The *Itata* was then forced to return to San Diego without landing her cargo for the insurgents. The necessary arms and ammunition were arranged for in Europe; they were shipped in a British vessel, and transferred to a Chilian steamer at Fortune Bay, in Tierra del Fuego, close to the Strait of Magellan and the Falkland Islands, and thence carried to Iquique, where they were safely disembarked early in July 1891. A force of 10,000 men was now raised by the *junta* of the revolution, and preparations were rapidly pushed forward for a move to the south with the object of attacking Valparaiso and Santiago. Early in August a portion of the revolutionary squadron, comprising the *Blanco Encalada* and other ships, was sent to the southward for reconnoitring purposes, and put into the port of Caldera. During the night, and whilst the *Blanco Encalada* was lying quietly at anchor, a torpedo boat called the *Almirante Lynch*, belonging to the Balmaceda faction, steamed into the bay of Caldera and discharged a torpedo at the rebel ship. The *Blanco Encalada* sank in a few minutes, and 300 of her crew perished.

*Civil war.*

In the middle of August 1891 the rebel forces were embarked at Iquique, numbering in all about 9000 men, and sailed for the south. On 21st August the insurgent army was disembarked near Concon, about twenty miles north of Valparaiso. A severe fight ensued, in which the troops of President Balmaceda were defeated with heavy loss. This reverse roused the worst passions of the President, and he ordered the arrest and imprisonment of all persons suspected of sympathy with the revolutionary cause. The population generally were, however, distinctly antagonistic to Balmaceda; and this feeling had become accentuated since 17th August 1891, on which date he had ordered the execution of a number of youths belonging to the military college at San Lorenzo on a charge of seditious practices. The shooting of these boys created a feeling of horror throughout the country, and a sensation of uncertainty as to what measures of severity might not be practised in the future if Balmaceda won the day. After the victory at Concon the insurgent army, under command of General Campos, marched in a southerly direction towards Viña del Mar, and thence to Placilla, where the final struggle in the conflict took place. Balmaceda had massed his troops in the vicinity, and confidently expected a victory on account of the superior number of his forces. The fighting was fierce, but the rebel artillery was well directed and thoroughly prepared the way for an assault of the positions. The rebels drove their opponents at the point of the bayonet from one line of trenches to another, until they remained absolute masters of the field and the Balmacedist army was in full flight without attempting to preserve any sort of order or discipline. Three days later the victorious insurgents entered Santiago and assumed the government of the republic. After the battle of Placilla it was clear to President Balmaceda that he could no longer hope to find a sufficient strength amongst his adherents to maintain himself in power, and in view of the rapid approach of the rebel army he abandoned his official duties to seek an asylum in the Argentine Legation.

*Defeat and suicide of Balmaceda.*

The President remained concealed in this retreat until 18th September. On the evening of that date, when the term for which he had been elected President of the republic terminated, he committed suicide by shooting himself. The excuse for this act, put forward in letters written shortly before his end, was that he did not believe the conquerors would give him an impartial trial. The death of Balmaceda finished all cause of contention in Chile, and was the closing act of the most severe and bloodiest struggle that country had ever witnessed. In the various engagements throughout the conflict more than 10,000 lives were lost, and the joint expenditure of the two Governments on military preparations and the purchase of war material exceeded £10,000,000 sterling. (See also the section on the war below.)

An unfortunate occurrence soon after the close of the revolution brought strained relations for a short period between the Governments of the United States and Chile. A number of men of the U.S.S. *Baltimore* having been given liberty on shore, an argument arose between some of them and a group of Chilian sailors in a drinking den in Valparaiso. Words led to blows. The Americans were badly handled, one of their number being killed and others severely hurt. The United States Government characterized the affair as an outrage, demanding an indemnity of $1,000,000 as satisfaction. The Chilian authorities demurred at this attitude, and attempted to argue the matter. Mr Blaine, then Secretary of State, refused peremptorily to listen to any explanations. In the end Chile paid an indemnity as asked, but the affair left bad feeling in its train.

***President Montt.***

The close of the revolution against Balmaceda left the government of Chile in the hands of the *junta* under whose guidance the military and naval operations had been organized. Admiral Jorje Montt had been the head of this revolutionary committee, and he acted as President of the provisional Government when the administration of the country changed hands after the victory of the Congressional party. An election was now immediately ordered for the choice of a President of the republic and for representatives in the Senate and Chamber of Deputies. Admiral Montt, as head of the executive power, staunchly refused to allow official influence to be brought to bear in any way in the Presidential campaign. The great majority of the voters, however, required no pressure to decide who was in their opinion the man most fitted to administer the affairs of the republic. For the first time in the history of Chile a perfectly free election was held, and Admiral Montt was duly chosen by a nearly unanimous vote to be chief magistrate for the constitutional term of five years. The Senate and Chamber of Deputies were formally constituted in due course, and the Government of the republic resumed normal conditions of existence. The new President showed admirable tact in dealing with the difficult problem he was called upon to face. Party feeling still ran high between the partisans to the two sides of the recent conflict. Admiral Montt took the view that it was politic and just to let bygones be bygones, and he acted conscientiously by this principle in all administrative measures in connexion with the supporters of the late President Balmaceda. Early in 1892 an amnesty was granted to the officers of the Balmaceda *régime*, and they were freely permitted to return to Chile without any attempt being made to molest them. The first political act of national importance of the new Government was the grant of control to the municipalities, which hitherto had possessed little power to direct local affairs, and were not even permitted to dispose of the municipal revenues to any important amount without first obtaining the consent of the central Government. Almost absolute power was now given these corporations to manage their own concerns, and the organization of the police was placed in their hands; at a later period, however, it was found necessary to modify this latter condition.

President Montt next turned his attention towards the question of how best to repair the damage occasioned to the country by eight months of civil warfare. The plan of public works authorized in 1887 was reconsidered, and the construction of portions of the various undertakings recommenced. The army and navy were reorganized. Additional instructors were brought from Germany, and all arms of the military service were placed on a thoroughly efficient footing in matters of drill and discipline. Several new and powerful cruisers were added to the navy, and the internal economy of this branch of the national defence was thoroughly inspected and many defects were remedied. President Montt then took in hand the question of a reform of the currency, the abolition of inconvertible paper money, and the re-establishment of a gold basis as the monetary standard of the republic. This reform of the currency became the key-note of the President's policy during the remainder of his term of office. Great opposition was raised by the representatives of the debtor class in Congress to the suppression of the inconvertible paper money, but in the end President Montt carried the day, and on 11th February 1895 a measure finally became law establishing a gold currency as the only legal tender in Chile. In July 1896 the Conversion Act was put in force, a dollar of 18d. being the monetary unit adopted. In 1895 relations with the neighbouring republic of Argentina began to become somewhat strained in regard to the interpretation of the treaty concerning the boundary between the two countries. The treaties of 1881, 1893, and 1895 left doubts in the minds of both Chilians and Argentines as to the position of the frontier line. On 17th April 1896 another protocol was drawn up, by which the contending parties agreed to submit any differences to the arbitration of Great Britain, at the instance of one or both Governments. President Montt had now fulfilled his term of office, and on 18th September 1896 he handed over the presidential power to his successor, Señor Federico Errazuriz, who had been duly elected in the month of June previously.

***President Errazuriz.***

The election for the position of President of the republic was closely contested in 1896 between Señor Errazuriz and Señor Reyes, and ended in the triumph of the former candidate by the narrow majority of one vote. The father of the new President had been chief magistrate of Chile from 1871 to 1876, and his administration had been one of the best the country had ever enjoyed; his son had therefore traditions to uphold in the post he was now called upon to fill. At the commencement of 1897 the public attention was absorbed by foreign political questions. The problems to be solved were the frontier difficulty with Argentina, the question of the possession of Tacna and Arica with Peru, and the necessity of fulfilling the obligation contracted with Bolivia to give that country a seaport on the Pacific coast. The treaty made in 1896 with the Argentine Government, referring to the arbitration of disputed points concerning the boundary, became practically for the moment a dead letter, and both Argentines and Chilians began to talk openly of an appeal to arms to settle the matter once for all. The Governments of both countries began to purchase large supplies of war material, and generally to make preparations for a possible conflict. In these circumstances no final settlement with Peru and Bolivia was possible, the authorities of those republics holding back to see the issue of the Chile-Argentine

dispute, and Chile being in no position at the time to insist on any terms being arranged. So matters drifted until the beginning of 1898. In July of that year the crisis reached an acute stage. Both Chile and Argentina put forward certain pretensions to territory in the Atacama district to the north, and also to a section of Patagonia in the south. Neither side would give way, nor was any disposition exhibited to refer the matter to arbitration under the protocol of 1896. The cry of an acute financial crisis emanating from the fear of war with Argentina was now raised in Chile. The President was advised that the only way of averting the financial ruin of the banking institutions of the republic was to suspend the conversion law and lend from the national treasury inconvertible notes to the banks. Señor Errazuriz weakly gave way, and a decree was promulgated placing the currency once more on an inconvertible paper money basis until 1902.

***Crisis with Argentina.***

In August of 1898 the Chilian Government determined to insist upon the terms of the protocol of 1896 being acted upon, and intimated to Argentina that they demanded the fulfilment of the clause relating to arbitration on disputed points. This was practically an ultimatum, and a refusal on the part of the Argentine Government to comply with the terms of the 1896 agreement meant a declaration of war by Chile. For a few days the issue hung in the balance, and then the Argentine Government accepted the provisions made in 1896 for arbitration. The dispute concerning the Atacama district was submitted to an arbitration tribunal, consisting of the representative of the United States in Argentina, assisted by one Argentine and one Chilian commissioner. This tribunal, after due investigation, gave their decision in April 1899, and the verdict was accepted unreservedly by both Governments. The dispute regarding the Patagonian territory was submitted to the arbitration of Great Britain, and a commission (consisting of Lord Macnaghten, Sir John Ardagh, and Sir T. H. Holdich) was appointed in 1899 to hear the case.

The Argentine difficulty was ended, but Chile still had to find a settlement with Peru and Bolivia. The treaty made with the former country in 1893 was not ratified, as it was thought to concede too much to Peru, and the subsequent *ad referendum* treaty was rejected on account of Peru claiming that only Peruvians, and not all residents, should have the right to vote in the plebiscite to be taken by the terms of the treaty of 1883 for the possession of Tacna and Arica. By the terms of the armistice of 1883 between Chile and Bolivia, a three years' notice had to be given by either Government wishing to denounce that agreement. By the protocol of 1895 Chile agreed to give to Bolivia the port of Arica, or some other suitable position on the seaboard. On these lines a settlement was proposed. Vitor, a landing-place a little to the south of Arica, was offered by the Chilian Government to Bolivia, but refused as not complying with the conditions stated in the protocol of 1895; the Bolivians furthermore preferred to wait and see if Arica was finally ceded by Peru to Chile, and if so to claim the fulfilment of the terms of the protocol.

After the accession to office of President Errazuriz there was no stability of any ministry. Political parties in Congress were so evenly divided that a vote against the ministry was easy to obtain, and the resignation of the Cabinet immediately followed in accordance with the so-called parliamentary system in vogue in Chile. The President of the republic has no power to dissolve the Chambers, to endeavour to remedy the evil by one or another political party obtaining a substantial working majority, but must wait to see the results of the triennial elections. As a consequence of these conditions Conservative, Liberal, and coalition ministries held office at short intervals. These unsettled political circumstances checked any continuity of policy, and tended to block the passage of all useful legislation to help forward the economic development of the country and inhabitants; on the other hand, the financial situation was better by the end of 1899 than in the previous year, since all proposals for a fresh paper issue had been vetoed; and the elections for Congress and municipal office at the opening of 1900 returned a majority favourable to a stable currency policy.

In September 1900 a fresh outburst of hostile feeling against Chile was created in Argentina by a note addressed by the Chilian Government to Bolivia, intimating that Chile was no longer inclined to hand over the port of Arica or any other port on the Pacific, but considered the time ripe for a final settlement of the questions connected with the Chilian occupation of Bolivian territory, which had now been outstanding for sixteen years. The foreign policy of Chile, as indicated by this note, was considered by Argentina to be grasping and unconciliatory, and there were rumours of an anti-Chilian South American federation. Chile disclaimed any aggressive intentions; but in December the Bolivian Congress declined to relinquish their claim to a port, and refused to conclude a definite treaty of peace. The year closed with a frontier incident between Chile and Argentina in the disputed territory of Ultima Esperanza, where some Argentine colonists were ejected by Chilian police; but both Governments signed protocols agreeing not to take aggressive action in consequence.

At the opening of 1901 the country was chiefly interested in the forthcoming Presidential election, for which the candidates were Don Pedro Montt (Conservative and Clerical) and Señor Ferman Riesco (Liberal).

***President Riesco.***

The relations between President Errazuriz and Congress became rather strained, owing to the former's inclination to retain in office a ministry on which Congress had passed a vote of censure; but Errazuriz had been in ill-health for more than a year, and on 1st May he resigned, and died in July. At the ensuing election Riesco was elected President. The attitude of Chile towards the Pan-American Congress at Mexico became a matter of interest in the autumn, particularly in connexion with the proposal for compulsory arbitration between all American Governments. The Chilian Government made it quite clear that they would withdraw from the Congress if this proposal was meant to be retroactive; and their unyielding attitude testified to the apprehensions felt by Chile concerning United States interference. In October the Chilian Government announced that the contemplated conversion scheme, for which gold had been accumulated, would be postponed for two years (till October 1903), the gold being held as a reserve fund pending the result of the arbitration over the Argentine frontier. This was generally considered to be a reasonable and statesmanlike course. Unfortunately, a recrudescence of the excitement over the boundary dispute was occasioned by the irritation created in Argentina by the fact that, pending a decision, Chile was constructing roads in the disputed territory. During December 1901 relations were exceedingly strained, and troops were called out on both sides. But at the end of the month it was agreed to leave the question to the British arbitrators, and the latter decided to send one of their number (Sir T. H. Holdich) to examine the territory (C. E. A.)

*The Civil War of 1891.*—The military aspects of the conflict between President Balmaceda and Congress of the Chilian republic, which began in 1890, and led, early in the following years, to civil war, are worth considering separately. The merits of the original dispute

are not by any means clear, but powerful foreign interests were arrayed on the side of Congress, and financial support was forthcoming in defence of those interests. The geographical conditions of Chile are such as to render sea power the dominating factor in any internal or external conflict. The country is practically a long strip of sea-board, with few or no longitudinal communications on shore. Sea transport was therefore vital to military operations. On 7th January 1891 the Chilian fleet, which included the armour-clads *Blanco Encalada*, *Cochrane*, and *Huascar*, declared for Congress. The army, consisting at this time of about 6000 men, adhered to the President. One side was thus driven to create an army, while the other sought to improvise a fleet. The Congressionalists determined therefore to seize Iquique as a base and to carry on their preparations in the province of Tarapacá. Hostilities commenced by the bombardment and capture of Pisagua, a coast town about 35 miles to the north of Iquique. Pisagua was retaken by the President's forces, and again occupied by the Congressionalists after a heavy naval bombardment. Colonel Robles, the commander-in-chief of the army, endeavouring to recapture Pisagua, was defeated, and the garrison of Iquique being withdrawn to his assistance, the Congressionalists occupied the place. Collecting part of his forces, Colonel Robles succeeded in retaking Iquique, which was then heavily bombarded on 17th February, and was surrendered upon terms arranged on board H.M.S. *Warspite*, the British flagship. The Congressionalists, under Colonel Canto, made great preparations to hold their position, and Colonel Robles, without waiting to concentrate a sufficient force, attacked them at Pozo al Monte. The troops, about 1400 in number, were disastrously defeated and the commander-in-chief was killed. The rest of the President's forces in this district then crossed the Andes and made their way southwards under great difficulties. The effect of these preliminary operations was to give the Congressionalists a good base at Iquique and a firm footing in the province of Tarapacá, which is isolated by desert country from the rest of Chile. Time was on their side, and, moving gradually south, they occupied Caldera and set about the creation of an army. Mannlicher repeating rifles and large stores of ammunition were purchased in Europe, and the services of Colonel Körner, a German expert, were obtained. By August about 10,000 men had been armed, organized, and drilled.

Meanwhile the 700-ton torpedo gunboats *Condell* and *Lynch* had arrived at Valparaiso from Europe, and the *Imperial*, a mail steamer of 3300 tons and 15 knots, had been chartered by the President and was armed to serve as an extemporized cruiser. These three vessels went to sea on 18th April, and on the night of the 22nd the *Condell* and *Lynch* found and attacked the *Blanco Encalada* at anchor in Caldera Bay. Many of the Congressionalist officers were dining on shore, and a bad look-out was kept. The *Condell* discharged three torpedoes at about 100 yards' distance without result; but the *Lynch*, closing the armour-clad on the other side, succeeded in striking her amidships. The *Blanco Encalada* sank in a few minutes, the *Condell* and *Lynch* escaping without much damage to either, and with a loss of one killed and ten wounded. This was a striking achievement, carried out with great gallantry; but the attack would probably have failed if a proper watch had been kept on board the *Blanco Encalada;* and although the gunboats made other cruises, nothing further was effected.

On 20th August the Congressionalist forces, 9280 strong, disembarked in Quinteros Bay, about 28 miles north of Valparaiso. On the following day the President's troops holding the southern bank of the Aconcagua river were attacked and defeated. The position was a strong one, and the defenders were greatly superior in field artillery, but suffered somewhat from the fire of the Congressionalist vessels. The troops were, however, badly handled, and both flanks were turned. The battle of Concon was the first in which one side was armed wholly with repeating rifles. The Congressionalists took 1500 prisoners, "most of whom asked for and obtained leave" to change their flag. The advance on Valparaiso continued, and it was intended to attack the position of Viña del Mar, about 4 miles from the town, on the 23rd. The attack was not delivered, as the Congressionalist troops did not reach their appointed positions in time and two of the brigade commanders considered the entrenchments impregnable. After an ineffective artillery engagement the plan was abandoned in favour of a flank march with a view to approach Valparaiso from the south. This offered a great opportunity, which the Balmacedist forces totally neglected. On 27th August the Congressionalist army arrived in front of the heights of La Placilla, where the enemy, about 14,000 strong, were attacked on the following day. The left flank of the position was turned and the victory was complete, the loss of the defending and attacking forces being about 3400 and 1800 respectively. The Männlicher rifles doubtless contributed to the victory, but the waste of ammunition was great, and the imported arms showed some weakness. The Balmacedist troops were, however, badly commanded throughout this brief campaign, which affords few military lessons. After the battle of La Placilla, Valparaiso at once surrendered, and the triumph of the Congressionalist party was complete.

The Chilian civil war supplies a remarkable example of the influence of sea power. The revolt of the navy proved fatal to President Balmaceda's cause. Unable to reinforce his troops in the north, he lost Iquique, the province of Tarapacá, and the nitrate revenues. It was thus open to the Congressionalists to raise and equip an army at leisure and to disembark it wherever they chose. Military success, for which the way was prepared by the navy, produced decisive results, and the Chilian civil war conformed exactly to the teaching of history. (G. S. C.)

**Chillan,** a town of Chile, capital of the province of Nuble and of the department of Chillan, 248 miles S. of Santiago by rail. It is reputed to be one of the most picturesque cities of Chile, with fine streets and public squares. Population (1898), 32,769.

**Chillicothe,** capital of Livingston county, Missouri, U.S.A., situated in the northern part of the state, on Grand river, at an altitude of 765 feet. It has three railways, the Chicago, Burlington, and Quincy, the Chicago, Milwaukee, and St Paul, and the Wabash. Population (1880), 4078; (1890), 5717; (1900), 6905, of whom 255 were foreign-born and 538 were negroes.

**Chillicothe,** capital of Ross county, Ohio, U.S.A., situated in 39° 8′ N. lat. and 82° 52′ W. long., in the southern part of the state, at an altitude of 620 feet. It has a regular plan with broad streets, on a level plain on the right bank of Scioto river, which here is not navigable. It is at the intersection of three great railways, the Baltimore and Ohio South-Western, the Cincinnati, Hamilton, and Dayton, and the Norfolk and Western. Population (1880), 10,938; (1890), 11,288; (1900), 12,976, of whom 910 were foreign-born and 986 were negroes.

**Chimkent,** a district town of Russian Central Asia, province Syr-dari-insk, on the mountain stream Badam. It has seven cotton-cleaning mills and soapworks, and its trade is mainly in cattle, hides, wool, raw cotton, grain, oil, and leather. Population, 10,756.

# CHINA.

## I. Geography and Statistics.

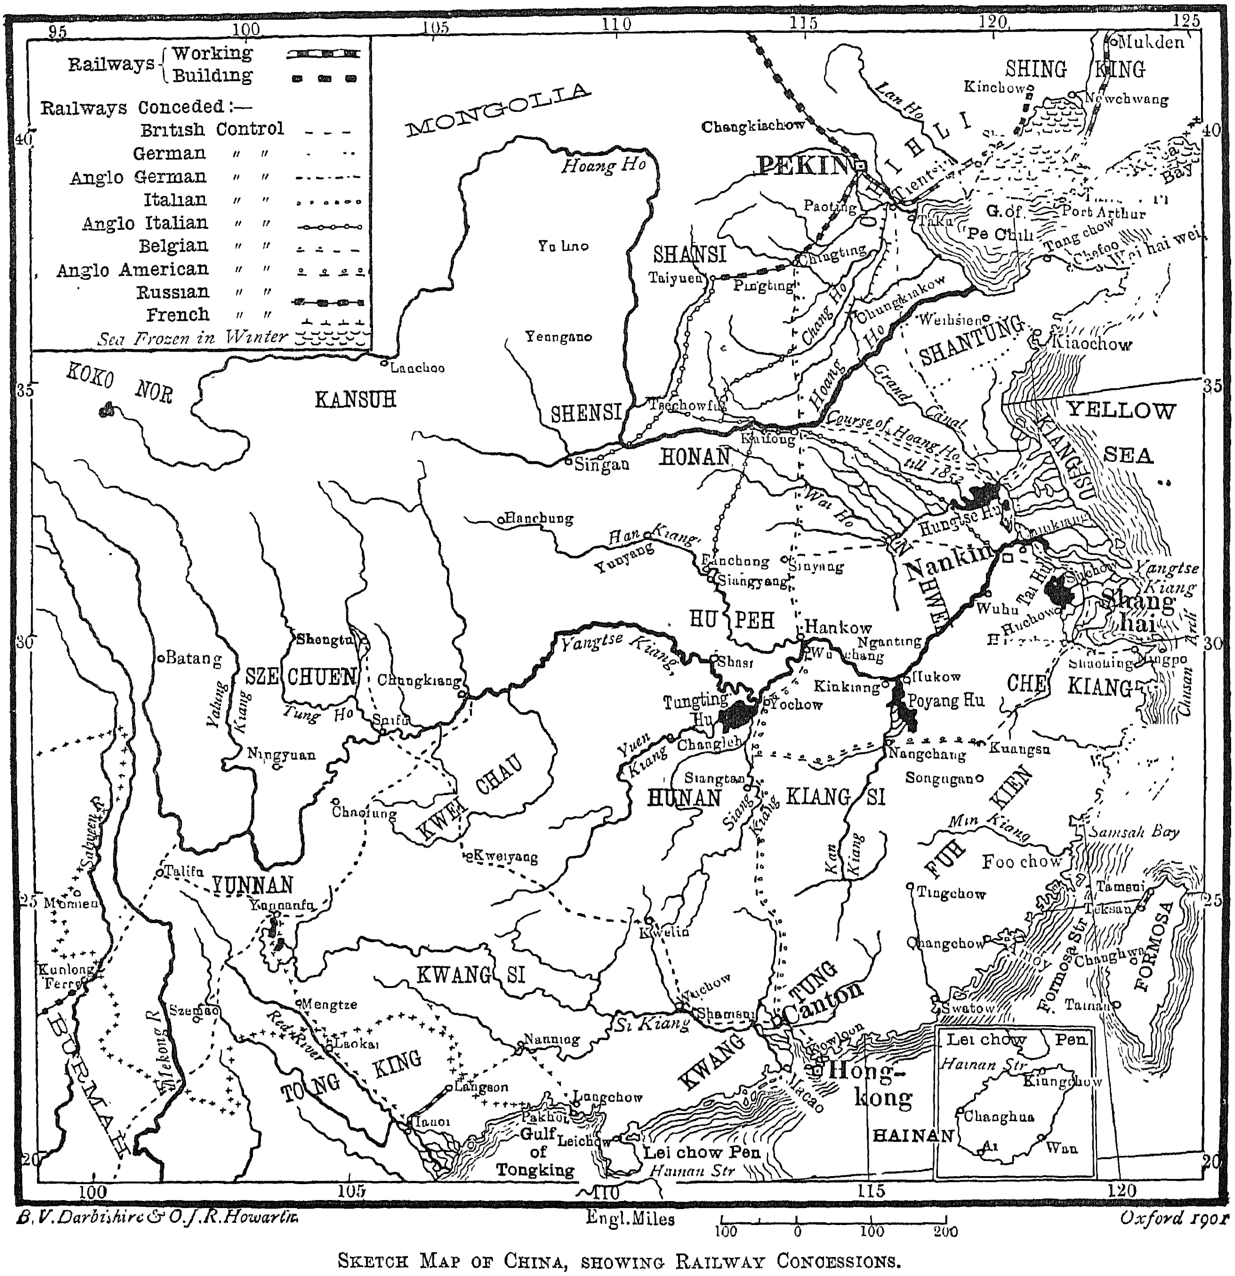
*Physical Geography.*—Important additions to our knowledge of the physical geography of China were made within the period 1875-1900. Chief among these is the work of Baron F. von Richthofen, published at Berlin in 1882, including his geological maps of the northerly part of the empire. The hitherto unknown tracks of western and south-western China have attracted numerous travellers, and the trade routes and markets of Szechuen and Yunnan have been explored and described by officers of the British consular service. And within the last year or two of the 19th century private enterprise undertook a survey of the whole route from the Burma frontier to the Yangtse at Chungking, with a view to the construction of a through line of railway. Several eminent French explorers have traversed the same region with the like object of finding a feasible route from Tongking into Szechuen. For details reference should be made to the works cited at the close of this article, but the following general remarks on the country as a whole are submitted.

The ancient stratified rocks of China form beds of stupendous thickness. Of these the most widely diffused is a characteristic limestone to which von Richthofen gives the name "Sinian," its prevalence being so universal that it deserves to take its name from the whole country. In the provinces bordering on the lower Yangtse this limestone belt occupies the centre of a group of formations,—the lower being quartzose sandstone and argillite schists, and the upper again argillaceous sandstone often locally altered into quartzite. In Szechuen the limestone attains a thickness of upwards of 11,000 feet in some parts. Extending, as the formations do, over nearly the whole of China, they vary indefinitely in their relations to one another, but the whole points to a long period of quiescence when the central and northern parts of China were submerged under deep water. The period corresponds to the Silurian and Devonian epochs in the geology of Europe. Outflows of granitic rock and other violent disturbances brought the period of quiescence to a close. Over the limestone formations there is next found a series of Carboniferous strata almost equally widely diffused. This also varies greatly in various parts of the country. In some parts, as in Shansi, the seams of pure coal are of great thickness, as much as 30 feet or more, in others the beds are thin, and separated by layers of limestone and argillaceous strata. These conditions point to a general elevation of the ocean bed alternating with periods of subsequent depression. The Coal Measures are in turn overlain by sedimentary deposits of sandstone, shales, and conglomerates, to a depth of many thousand feet. A general elevation then took place probably soon after the close of the Carboniferous epoch, and there is no evidence to point to any subsequent depression beneath the level of the sea. The Jurassic and Cretaceous series of rocks do not appear to be represented in China. The dominant feature in the geography of China is the existence of the enormous mountain masses on which her western frontier abuts. From these main ranges, spurs or outliers run into China, having generally an east or west trend, and these have determined the courses of the great rivers. Having their sources at a great height, and draining very extensive basins, these rivers have for ages been bringing down quantities of silt which have been deposited on the beds of ancient lakes, and on the sea bottom, thus forming the Great Plain of China, which is now so large and important a part of the empire. It fills an area of about 200,000 square miles, and is still growing. Denudation has thus been the principal agency in giving to Chinese scenery its characteristic features. In Hunan and in Szechuen, where a soft red sandstone abounds, it has converted what at one time was probably a uniform plateau into a thoroughly hilly country.

Although large masses of eruptive granite and other igneous rocks are to be found in various parts, it does not appear that volcanic energy has for many ages had any part in determining the configuration of the country. There is no trace anywhere of recent active volcanoes. Intrusive dykes of granite, porphyry, &c., are frequent, more especially in the northerly provinces and Shantung, and in a few places metamorphic action has altered the character of the rocks, but on the whole the sedimentary deposits have not been greatly disturbed by subterraneous activity. In the province of Shansi a plateau stands out above the plain where the several strata can be traced in a nearly horizontal position over a superficial area of 30,000 square miles. Looking from the plain westwards there is seen to be, first, a rugged barrier made up of very ancient formations; second, a general substructure of limestone of 2000 feet in thickness; third, a series of coal-bearing strata of 500 feet; fourth, the post-Carboniferous strata of 3000 feet; and, lastly, a general cover of loess. This is the largest coal field in China, and probably in the world, but a similar sequence of strata is found prevailing generally. Though no recent volcanic agency has been traced, there have been, subsequent to the limestone and carboniferous periods, very considerable upheavals, due either to subterranean forces or to the puckering consequent on lateral compression. The ridges thus thrown up have taken generally a north-east and south-west trend. They do not rise to any great height, seldom reaching 5000 feet, nor does any one ridge stand out as the predominant mountain chain, but the result is to give a general mountainous character to large areas of the country. One such belt of hills runs through all the south-eastern provinces from Tongking to Hangchow Bay, terminating in the rocky islands of the Chusan Archipelago. Another runs through Szechuen, and is cut transversely by the Yangtse river, which there flows between limestone cliffs forming the picturesque scenery of the Yangtse gorges. A third series starts from the Mongolian plateau and runs through Chihli and Shansi, forcing the Yellow river to take a long sweep southwards until it finds its way through a similar series of gorges at Lungmen. In the provinces of Kweichow and Yunnan the north-east and south-west system meets the outlying spurs of the central Asian system, which run nearly at right angles to the former, thus causing a confused mass of lofty mountain peaks which defies description. Along such ridges the limestone strata are tilted up and exposed to view, and in a few cases the still deeper strata of ancient plutonic rocks, granitic gneiss, and schists are also exposed. At one of the gorges in the Yangtse, where the river has cut its way across the ridge, the formation is well seen. There is, first, a central core of granite, then a thin bed of metamorphic schist, then the limestone inclined at a high angle on each side, then carboniferous strata, and, lastly, the superincumbent layer of sandstone and other recent deposits,—the latter, however, being often eaten away by erosion down to the limestone. This north-east south-west system, however, is on the whole subordinate to the dominant east and west ranges, stretching

from the highlands of central Asia, which have determined the main watersheds. The general course of the rivers is thus from west to east, and whenever they meet these subordinate ranges they ultimately break across, though occasionally diverted for a time. Their course is thus sometimes a series of zigzags, now flowing parallel with the trend, and now breaking through at right angles, flowing in a deep rocky gorge. The formation of these gorges—some of which on the upper Yangtse, and also on the west or Canton river, are 2000 feet in depth—points to immense antiquity, and probably was preceded by a series of inland lakes. The extensive areas now filled with red sandstone such as exist in Hunan and Szechuen were doubtless the beds of such lakes.

A specially characteristic feature of north China is the deposit termed *loess*, which not merely imparts to the



SKETCH MAP OF CHINA, SHOWING RAILWAY CONCESSIONS.

country the physical character of the scenery, but also determines the agricultural products, the transport, and general economic life of the people. It is peculiar to north China, and is not found south of the Yangtse. The loess is a solid, but friable earth of brownish yellow colour, and when triturated with water is not unlike loam, but differs from the latter by its highly porous and tubular structure. Among its constituents, next to the argillaceous basis, fine sand and carbonate of lime predominate. It spreads alike over hills and valleys, smoothing over the irregularities, and has a depth, in many places, of over 1000 feet. It is not stratified, and has a tendency to vertical cleavage. It is full of fossil land shells, and contains bones of quadrupeds, but has no remains of either marine or fresh-water shells. From its porous nature water never lies on the surface. The rainfall is at once absorbed as by a sponge. On the other hand, moisture is retained in the lower portions for long periods. The drainage is consequently not carried on the top. Whatever streams or rivulets there are, at once cut their way through the friable earth to the subsoil, carrying down the débris to be deposited as alluvium on the plains. As the cleavage is

vertical the banks fall in, in perpendicular slabs, leaving a vertical wall on each side, often hundreds of feet in height. This is always the case in the newly-formed small affluents of the larger streams, and even in the older rivers the valley never slopes gradually down to the river bed, but approaches by a series of terraces, each backed by a vertical wall separating it from the next above. The consequence of this is that communication in a loess-covered country is extremely difficult. Seen from a distance, the valley may present a gentle undulating appearance, but as it is approached it shows a perfect labyrinth of deep cuts with perpendicular walls, among which the traveller without a guide may wander indefinitely, vainly seeking an exit. The loess soil is extremely favourable to agriculture. It bears excellent crops, and not merely on the lower grounds, but at altitudes of 6000 and 8000 feet. Wherever loess is found the peasant can live and thrive. Only one thing is essential, and that is the annual rainfall. As no artificial irrigation is possible, if the rain fails the crops must necessarily fail. Thus seasons of great famine alternate with seasons of great plenty. It appears, also, that the soil needs little or no manuring, and very little tillage. From its extremely friable nature the soil is easily broken up, and thus a less amount of labour is required than in other parts. The extreme porosity of the soil probably also accounts for the length of time it will go on bearing crops without becoming exhausted. The rainfall penetrating deeply into the soil in the absence of stratification, comes into contact with the moisture retained below, which holds in solution whatever inorganic salts the soil may contain, and thus the vegetation has an indefinite store to draw upon. Another peculiarity of loess in China is that it lends itself readily to the excavation of dwellings for the people. In many places whole villages live in cave dwellings dug out in the vertical wall of loess. They construct spiral staircases, selecting places where the ground is firm, and excavate endless chambers and recesses which are said to be very comfortable and salubrious dwellings.

With respect to its origin, Baron von Richthofen is of opinion that loess is a subaërial formation. The entire absence of stratification, except in what he calls regenerated loess, *i.e.*, original loess washed down and deposited in lake bottoms, and the entire absence of marine or freshwater shells, forbid the supposition that it is an aqueous deposit. The only other agency that can be suggested is air currents combined with rainfall. The latter carries down certain débris, while the former carries the fine dust and sand from the steppes among the herbaceous vegetation, where it is retained and mixed with the decaying leaves and roots. No stratification can take place, and any approach to it will be completely effaced by the roots which descend vertically, and are probably the chief agents in producing the vertical cleavage.

*Meteorology.*—The figures in the Table are taken from the observations recorded at the French mission station at Shanghai. They give the average of eight years' observations. The absolute maximum and minimum temperatures during the period were 102° and 12·2° respectively.

| | Minimum Temperature Fahr. | Maximum Temperature Fahr. | Rainfall, Inches. |
|---|---|---|---|
| January | 17°·8 | 57°·2 | 2·27 |
| February | 24·3 | 61·0 | 2·88 |
| March | 30·2 | 75·9 | 2·87 |
| April | 36·7 | 84·2 | 3·59 |
| May | 46·9 | 89·2 | 2·87 |
| June | 57·7 | 92·8 | 7·86 |
| July | 67·8 | 97·2 | 3·56 |
| August | 65·3 | 95·5 | 4·65 |
| September | 55·8 | 90·7 | 5·72 |
| October | 40·1 | 82·6 | 2·84 |
| November | 28·9 | 72·7 | 1·96 |
| December | 21·2 | 65·3 | 1·39 |

*Climate.*—The climate of Shanghai, which is that of the lower Yangtse valley generally, is on the whole favourable. The three months from July to September are somewhat trying to Europeans. The temperature is high and the air is often laden with moisture. The prevailing winds during this season are south-easterly, caused by heat and the ascending current of air over the sandy deserts of central Asia, thus drawing in a current from the Pacific Ocean. In the winter the converse takes place, and the prevailing winds are north and north-west, which are cold and dry. During the eight or nine months from October to May the climate is bracing and enjoyable. The rainfall is moderate and regular, and a failure of the crops owing to prolonged droughts is very rare. Farther north, however, this is not the case. The provinces of Shantung and Shansi are peculiarly liable to prolonged periods of drought, with consequent severe famines such as that of 1877-78, when many millions died for sheer want of food. In these regions the air is generally extremely dry, and the daily variations of temperature consequent on excessive radiation are much greater than farther south. Dust storms are also prevalent during the spring months. In the southern and south-western provinces, especially Szechuen, the rainfall is much greater than that above recorded, and the summer heat, though not higher as a maximum than that of Shanghai, is naturally more prolonged and more enervating. But as a whole the climate of China compares favourably with that of any other part of the world lying between the same parallels of latitude. The greater part of it is what may be called a White Man's land, and in no part is it specially trying for Europeans. Certain areas of the province of Yunnan have a reputation among Chinese for unhealthiness, being mostly those lying at the bottom of deep valleys of the Mekong and Salween rivers, where malarial fever abounds, and it may be mentioned that certain areas in this province are the home of the bubonic plague, an epidemic which has recently been attracting so much attention. On the other hand, the plateaus of Yunnan, and notably the plain of Talifu, have the reputation of an excellent climate, the latter, according to Indian travellers, comparing favourably with Kashmir.

*Area and Population.*—The only change in area since 1875 is the annexation to Japan of the island of Formosa, with a population of about 2,000,000. In regard to population no accurate statistics are yet forthcoming. The Chinese Government continues from time to time to print in the *Peking Gazette* returns of the population made by one or other of the various provincial authorities, but, so far as is known, no systematic attempt has been made to take a general census on European principles. The method of numeration is to count the households, and from that to make a return of the total inhabitants of each province. As every province is divided for administrative purposes into so many *hsien* or districts, and every district into so many hundreds, there would be no great difficulty, as the population is nearly all rural and taxpaying, in obtaining fairly accurate returns if sufficient care were taken. It does not appear, however, that much care is taken. The standing orders are that the returns are to be made every three years, but as no allowance is made to meet the expenses, it is probable that in the majority of cases the last return is taken, and a round sum is added or subtracted to meet the supposed facts of the case. Mr E. H. Parker published in the number of the *Statistical Society's Journal* for March 1899 a series of tables translated from Chinese records, giving

the population from year to year between 1651 and 1860. These tables show a gradual rise, though with many fluctuations, up till 1851, when the total population is stated to be 432 millions. From that point it decreases till 1860, when it is put down at only 261 millions. The following table gives as nearly as can be ascertained the actual population at the present time :—

| Provinces. | Area Square Miles. | Population. | Population per Square Mile. |
|---|---|---|---|
| Anhwei | 53,000 | 20,600,000 | 388 |
| Chekiang | 34,700 | 11,600,000 | 334 |
| Chihli | 57,800 | 17,900,000 | 30 |
| Fuhkien | 41,300 | 23,500,000 | 568 |
| Honan | 61,300 | 22,100,000 | 360 |
| Hunan | 74,400 | 21,000,000 | 295 |
| Hupeh | 65,900 | 33,500,000 | 508 |
| Kansuh | 131,000 | 9,400,000 | 72 |
| Kiangsi | 67,500 | 24,000,000 | 355 |
| Kiangsu | 36,900 | 25,000,000 | 568 |
| Kwangsi | 80,100 | 5,100,000 | 63 |
| Kwangtung | 79,300 | 30,000,000 | 378 |
| Kweichow | 58,800 | 4,800,000 | 80 |
| Shansi | 66,700 | 11,800,000 | 177 |
| Shantung | 55,500 | 36,000,000 | 649 |
| Shensi | 74,000 | 8,300,000 | 112 |
| Szechuen | 160,000 | 67,100,000 | 418 |
| Yunnan | 155,000 | 6,200,000 | 40 |
| Total for eighteen provinces | 1,353,200 | 377,900,000 | |
| Manchuria | 362,310 | 12,500,000 | 34 |
| | 1,715,510 | 390,400,000 | |

*Constitution and Government.* — The Government of China is in theory an absolute monarchy. The Emperor is the sole and supreme head of the state. His will is absolute alike in the highest affairs of state and in the humblest details of private life. The highest form of legislation is an imperial decree, whether promulgated in general terms or to meet a special case. In either form it is the law of the land, and no privilege or prescriptive right can be pleaded against it. All officers of state, all judges and magistrates, hold their offices entirely at the imperial pleasure. They can be dismissed, degraded, punished without reason assigned, and without form of trial—even without knowing by whom or of what they are accused. There are no constitutional checks upon the arbitrary acts of the monarch. He is provided with an advisory council, but he is not bound by their advice, nor need he pretend that he is acting by and with their advice and concurrence. In practice, however, this arbitrary power is tempered in several ways. Firstly, although the constitution confers this absolute and unchecked power on the Emperor, it is not for his gratification but that he may exercise it for the good of his people. He rules by divine authority, and as the vice-regent of Heaven upon earth. If he rules corruptly or unjustly Heaven will send disasters and calamity on the people as a reproof; if the rule becomes tyrannical Heaven may withdraw its favour entirely, and then rebellion may be justified. Though treason and rebellion are ordinarily the most heinous of crimes, yet history applauds a successful revolt as evidence of the iniquities of the fallen dynasty. The Manchu dynasty came to the throne as foreign conquerors, nevertheless they have adopted this theory, and base their right to rule, not on the power of the sword, but on divine approval. On this moral ground they claim the obedience of their subjects, and submit themselves to the corresponding obligations. A more effective check upon the caprice of the Emperor, however, is the second which we will notice, namely, that the constitution prescribes that the Emperor shall live in seclusion. He is consequently dependent for his facts on such information as the courtiers and high officers of state permit to reach him, and he is further dependent for the execution of his decrees on such means as these same officers supply him with. Though in theory he can command the services and money of his subjects to an unlimited extent, yet the crown as such has no revenues peculiarly its own. It is dependent for the pay of the troops, as well as for the ordinary expenses of the imperial household, on contributions levied through the high officials on the several provinces, and without their concurrence and co-operation nothing can be done. The power of the purse and the power of the sword are thus exercised mediately through the instruments recognized by the constitution, and it thus comes about that the autocratic power is in practice transferred to the general body of high functionaries, or to that clique of them who for the time being have the ear of the Emperor, and who are united enough and powerful enough to impose their will on the others. The high functionaries of state who thus really wield the supreme power are almost without exception civil officials who have risen from the ranks of the people. There is no hereditary aristocracy in the European sense of the term. Hereditary rank is indeed bestowed on a few public servants usually for a limited number of lives, and there are among the descendants of the Manchu chieftains, who helped to found the dynasty, a few who hold titles of nobility, but in either case the rank *per se* gives them no status in the constitution. Among the princes of the blood there are a small number who hold high office and take an important part in the Government, such as the late Prince Kung and Prince Ching, the former and the present head of the Tsung-Li-Yamen, but their right to have a voice in public affairs is in virtue of their holding office, not in virtue of their nobility. Practically all the high officials who now constitute the Government of China have risen through the junior ranks of the civil service, and obtained their high position as the reward—so it must be presumed—of long and distinguished public service.

The functions of Government are divided between (*a*) the central administration and (*b*) the provincial administration. The empire proper is divided into eighteen provincial governments, each of which has a complete administrative machinery of its own, and possesses a quasi-independence in financial and military affairs. In some cases two or three are grouped together under a governor-general, often called a viceroy, without, however, affecting their independent status. At the head of each province is a governor, whose main functions are to keep the peace and preserve order, to collect the taxes, to raise and pay his own troops, pay the salaries of the civil service, remit the regulation quota of the taxes in money and in kind, as the case may be, to Peking, and to find and remit the extra "squeezes" which the needs of the central Government may demand. If he does all that and things go smoothly, the central Government does not interfere with him. He renders *pro formâ* accounts to the Board of Revenue at Peking, but no effective scrutiny is maintained. He is not responsible for disorder beyond his own border, nor bound to send military aid to his neighbours even against foreign invasion. The functions of the central Government, on the other hand, are mostly confined to checking and registering the acts of the provincial governments, and seeing that things are done in conformity with precedent and with established rules. If the central authorities take the initiative, and issue orders, as they occasionally are forced to do, under foreign pressure, it by no means follows that they will be carried out. The orders, if unwelcome, are not directly disobeyed, but rather ignored, or specious pleas are put forward, showing the difficulty or impossibility of carrying them out at that particular juncture.

The central Government always wields the power of removing or degrading a recalcitrant governor, and no case has been known where such an order was not promptly obeyed. But the central Government being composed of officials, stand by their order, and are extremely reluctant to issue such a command, especially at the bidding of a foreign Power. Generally the opinion of the governors and viceroys has great weight with the central Government, and probably no great measure of policy would be entered upon without their advice and concurrence. The Boxer troubles and the flight of the court from Peking on the approach of the foreign expeditionary force (Aug. 1900) shook the whole governmental fabric of the Chinese Empire. This and the following sections must therefore be taken as representing the normal condition of things before the outbreak of disturbances in 1900.

*Central Administration.*—The following are the principal departments of the central Government :—

1. The Grand Secretariat (*Neiko*), consisting of four grand secretaries and two assistant grand secretaries, half of whom, according to a general rule applicable to nearly all the high offices in Peking, must be Manchu and half Chinese. This was originally the Supreme Council of the empire, but under the present dynasty it has ceased to be of active importance. It constitutes the Imperial Chancery or Court of Archives, and admission to its ranks confers the highest distinction attainable by Chinese officials, though with functions that are almost purely nominal. Members of the Grand Secretariat are distinguished by the honorary title of *Chung-tang.* The most distinguished viceroys are usually advanced to the dignity of grand secretary while continuing to occupy their posts in the provinces.

2. Grand Council (*Chun Chi Chu*).—This department, the actual Privy Council of the sovereign, in whose presence its members daily transact the business of the state, is composed of a small knot of men holding various high offices in the Government boards at Peking. The number is undetermined, but at present it is five. The literal meaning of the Chinese name *Chun Chi Chu* is "place of plans for the army," and the institution derives its name from the practice established by the early emperors of the dynasty of treating public affairs on the footing of a military council. The usual time of transacting business is, in accordance with Chinese custom, from 4 to 6 A.M.

3. Tsung-Li-Yamen.—This, the best known of all the Chinese departments, was created after the Anglo-Chinese war in 1860 as a Board for Foreign Affairs. Previously to that war, which established the right of foreign Powers to have their representatives in Peking, all foreign business was transacted by one of the provincial viceroys, chiefly the viceroy of Canton. The only department at Peking which dealt specially with foreign affairs was the *Li Fan Yuen*, or Board of Control for the dependencies, which regulated the affairs of Mongolia, Tibet, and the tributary states generally. With the advent of formally accredited ambassadors from the European Powers something more than this was required, and a special board was appointed to discuss and if possible settle all questions with the foreign envoys. The number was originally four, with Prince Kung, a brother of the late Emperor *Hsien Feng* at their head. It has since been raised to ten, another prince of the blood, Prince Ching, being now president. The members are spoken of collectively as the prince and ministers. For a long time the board had no real power, and was looked on rather as a buffer between the foreign envoys and the real Government. The importance of foreign affairs, however, especially since the Japanese war, has identified the Yamen more with the Grand Council, several of the most prominent men being members of both. At the same time that the Tsung-Li-Yamen was created two important offices were established in the provinces for dealing with foreign commercial questions, viz., the Superintendencies of Trade for the northern and southern ports, the former being given to the governor-general of Chihli, and the latter to the governor-general at Nanking. Li Hung-Chang held the former for a number of years, and this position, combined with his personal talents and his influence at court, made him practically minister for foreign affairs over the heads of the Tsung-Li-Yamen.

4. The six Boards (*Liu Pu*). — The administrative work of the Chinese Government is divided between six departments termed boards, viz., the Board of Civil Office, the Board of Revenue, the Board of Ceremonies, the Board of War, the Board of Punishment, and the Board of Works. Each board has two presidents and four vice-presidents, half being Manchu and half Chinese. The official constitution of each is practically the same. They control each in its own sphere, the nature of which is sufficiently indicated by the names, the execution of that system of minute regulation for the conduct of public business which is the special function of the central Government. The presidents and vice-presidents of the boards, together with the heads of the censorate and the Hanlin college, may be said to constitute the central Government. They have not all an equal voice in the decisions of questions of state, but they are all qualified to tender advice to the sovereign, and it is from their number that the smaller executive councils above mentioned, viz., the *Chun Chi Chu* and the Tsung-Li-Yamen, are selected.

5. The Censorate (*Tu Cha Yuen*).—This is an institution peculiar to China. As the Emperor is condemned to live in seclusion, and has no means of learning what may be going on in the various parts of his dominions, the constitution endeavours to supply a remedy by providing a paid body of men whose duty it is to keep him informed of all facts affecting the welfare of the people and the conduct of Government, and in particular to keep an eye on the malfeasance of his officers. These men are termed *Yu shih*, generally translated censors. There are fifty-six of them, divided into fifteen divisions, each division taking a particular province or area, so as to embrace the whole eighteen provinces, besides one metropolitan division. With the growth of a native press this institution loses its *raison d'être*, and will probably fall into desuetude. It seems at the present moment to be more powerful for mischief than for good.

6. The Hanlin College (*Hanlin Yuen*).—The only other institution of the metropolitan administration that need be noticed is the Hanlin College, and this chiefly because the heads of the college, who are presumably the most eminent scholars of the empire, have the right of advising the throne on all public affairs, and are eligible as members of the Grand Council, or of the Tsung-Li-Yamen. In other respects its functions are purely literary. The Chinese set fire to it during the fighting in Peking in June 1900 in the hope of burning out the adjoining British Legation. The whole of the valuable library, containing some of the most ancient manuscripts in the world, was destroyed.

*Provincial Administration.*—No change has been made in the provincial administration since the article in the ninth edition of this work was written, where its organization is briefly described (*Ency. Brit.* v. 668). The extension of the telegraph system and the growth of native newspapers enable the central Government to take a more active supervision in provincial affairs than it has hitherto been wont to do.

*Civil Service : how recruited.*—The bureaucratic element

is so vital a feature of the government of China, that a short notice of the public examinations whereby the ranks are recruited may not be out of place. As a general rule students preparing for the public examination read with private tutors. There are neither high schools nor universities where a regular training can be got. In most of the provincial capitals, and at some other places, there are indeed institutions termed colleges, supported to a small extent from public funds, where advanced students can prosecute their studies, and where both students and tutors receive a small stipend, but they hardly count as factors in the national education. The work is done by private tutors who, on the other hand, are plentiful and cheap. After a series of preliminary trials the student obtains his first qualification by examination held before the literary chancellor in the prefecture to which he belongs. This is termed the *Siutsai*, or licentiate's degree, and in itself confers no claim to office, but is merely a qualification to enter for the higher examinations. The number of licentiate degrees to be given is, however, strictly limited; those who have failed to get in are set back to try again, which they may do as often as they please. There is no limit of age. Those selected next proceed to the great examination held at the capital of each province, once in three years, before examiners sent from Peking for the purpose. Here again the number who pass are strictly limited. Out of 10,000 or 12,000 competitors only some 300 or 350 can obtain degrees. The others, as before, must go back and try again. This degree, termed *Chu jen*, or provincial graduate, is the first substantial reward of the student's ambition, and of itself, without more, qualifies for the public service, though it does not immediately nor necessarily lead to active employment. The third and final examination takes place at Peking, and is open to provincial graduates from all parts of the empire. About 6000 competitors enter for this final test, which is held triennially, of whom 325 to 350 succeed in obtaining the degree of *Tsin shih*, or metropolitan graduate. These are the finally selected men who in due course become the officials and administrators of the empire. Several other doors are, however, open by which admission to the ranks of bureaucracy can be obtained. In the first place, to encourage scholars to persevere, a certain number of those who fail to reach the *chu jen*, or second degree, are allowed, as a reward of repeated efforts, to get into a special class from which selection for office may be made. Further, the Government reserves to itself the right to nominate the sons and grandsons of distinguished deceased public servants without examination. And, lastly, by a system of "recommendation," young men from the institution termed the Imperial Academy, or from the Manchu schools, or men who have served as clerks in the boards, may be put on the roster for substantive appointment. But over and above the foregoing, which are all deemed fair and legitimate methods of entering the public service, the necessities of the Chinese Government have from time to time compelled it to throw open a still wider door, namely, admission by purchase. During the Taiping rebellion, when the Government was at its wits' end for money, formal sanction was given to what had previously been only intermittently resorted to, and since then immense sums of money have been received by the sale of patents of rank, either to secure admission to office, or more rapid promotion of those already employed. As a result of this policy, the country has been saddled with thousands of titular officials far in excess of the number of appointments to be given away. The more deserving men are thus kept waiting for years, while inferior and less capable officials are pushed ahead, because they have money wherewith to bribe their way. The evils of the purchase system are recognized, and efforts from time to time are made to check it, but with indifferent success. The evil, however, is not altogether unmixed, as it has admitted into the service a number of men who are free from that bigoted adherence to Confucian doctrine which characterizes the literary classes, and more in touch with modern progress. All candidates who thus succeed, whether by examination, recommendation, or purchase, in entering the official ranks are then eligible for active employment, but as the number of candidates is far in excess of the number of appointments a period of weary waiting ensues. A few of the best scholars get admitted at once into the Hanlin college, or into one or other of the boards at Peking. The rest are drafted off in batches to the various provinces to await their turn for appointment as vacancies occur. During this period of waiting they are termed "expectants," and draw no regular pay. Occasional service, however, falls in their way, as when they are commissioned for special duty in outlying districts, which they perform as *Wei yuens*, or deputies of the regular officials. The period of expectancy may be abridged by recommendation or purchase, and it is generally supposed that this last lever must invariably be resorted to to secure any lucrative local appointment. A poor but promising official is often, it is said, financed by a syndicate of relations and friends, who look to recoup themselves out of the illegal, but customary perquisites which attach to the post. The appointments to the junior provincial posts are usually left to the provincial Government, but the central Government can always interfere directly. Appointments to the lucrative posts of customs *taotai* at the treaty ports are usually made direct from Peking, and the officer selected is not necessarily nor usually from the provincial staff. It would perhaps be safe to say that this appointment is always the result of a pecuniary arrangement of greater or less magnitude.

*Religion.*—As stated in the ninth edition (v. 671), the three principal religions of China are Confucianism, Buddhism, and Taoism. To these should be added ancestor-worship, which is practised universally by all classes, and which as a guiding principle of life has a more potent influence over the Chinaman than any other doctrine. It may be regarded as a branch of Confucianism. It did not, indeed, originate with the philosopher, having been practised long before he flourished, but the duty was strongly inculcated by him. He enjoined also the due observance of the ritual prescribed by the state for the worship of all recognized deities, including the worship of heaven and earth by the Emperor, and the worship by state officials of local divinities and deceased worthies who may from time to time have been canonized by imperial decree. Confucianism has no priesthood. The acts of worship are performed by the Emperor in person, by the officials, and by the head of every household, each acting within his own prescribed sphere. But Confucianism has always been a tolerant and non-aggressive religion. While enjoining the performance of ancestor-worship, and the observance of the prescribed formalities to recognized deities, it does not at all object to devotion being paid to other possible divinities, so long as the followers do not profess corrupt and heterodox doctrine. The line of division between what is orthodox and heterodox is more political than religious. Any cult which preaches a doctrine subversive of the fundamental and sacred principles of the constitution is heterodox and unlawful, and its practice renders the followers liable to severe penalties as savouring of rebellion. But mere belief in gods not recognized by the state is harmless, so long as it does not lead to action likely to be subversive of the existing order of things. Thus a Confucianist may at the same time be a Buddhist or a Taoist, or he may be all three. The three religions are not mutually exclusive, but run into one another, and hence it is impossible to give any statistics of the respective numbers of each. The Christian religion was long deemed heterodox, but since the conclusion of the treaties it has officially been proclaimed to be permissible. A Confucianist might now, from the Chinese point of view, be also a Christian, and probably many would become so if the Christian religion would accept them on these terms. One of the powerful congregations of the Roman Catholic Church was in the last century prepared to do so, at least it was prepared to allow converts to continue ancestor-worship. The proposal was overruled by the Pope, but had it been permitted there would possibly have been by this time as many nominal Christians in China as there are professors of Buddhism, which was itself a foreign religion.

The state of religion in China may thus be summed up:—Confucianism in the wider meaning, as including ancestor-worship, is accepted universally. Ancestor-worship is practised by practically all classes. Confucianism, in the narrow sense of the worship of Confucius, is compulsory on all officials, and is voluntarily practised by all scholars and aspirants to literary honours. Buddhism is more or less practised, so far as occasional visits to the temples and to sacred shrines are concerned, by about half the population. Taoism is practised to a considerably smaller extent. The services of the priests of one or other sect are generally invoked for funeral ceremonies. The priests of both these sects live solely in temples and monasteries, and do not enter private houses except when invited, in which case their services are paid for. Neither class attempts to exercise any influence over the people, and both are held in low esteem. Mahommedanism in a modified form is professed by some thirty or forty millions scattered over the north and west of China. They usually perform ancestor-worship as well, and if officials, they take part in the Confucian ceremonies.

Christian missions, both Roman Catholic and Protestant, are now established in every province in China. Freedom to embrace the Christian faith is guaranteed by the Chinese Government, and as a rule the missionaries have free scope in teaching and preaching, though local disturbances are not infrequent. The number of Catholic converts is about one million, and that of all Protestant sects is reported to be slightly over 100,000.

An imperial decree which was made public in 1897, conferring a sort of official status on the hierarchy of the Roman Catholic Church in China, deserves a short notice. Since the conclusion of the treaties in 1860, permitting the practice and teaching of the Christian religion, the missionary question has been one of the most important which the Chinese Government has had to deal with. Though the average Chinaman is naturally tolerant and indeed indifferent in matters of religion, the preaching of Christianity has in many parts aroused fierce opposition, leading to attacks on mission stations with loss of life and property. These attacks have in turn given rise to serious diplomatic controversy, and questions connected with missions have formed no inconsiderable part of the work thrown upon the foreign legations in Peking. In general, a missionary is under the protection of his own Government, no matter what his creed may be; but France has from the first constituted herself the protector of Roman Catholic missions, irrespective of the nationality of the priest concerned, and she has thereby been able to bring pressure to bear on the Chinese Government out of all proportion to her commercial interests. An effort was made by the Chinese in 1886 to get rid of French domination by inducing the Pope to send a special legate to Peking as controller of Roman Catholic missions. The Vatican was disposed to consent; but the French Government made such strenuous opposition, threatening to withdraw the concordat in France, that the papal authorities were obliged to decline. France was unwilling to forgo the political influence which the position of protector of one or two thousand priests and about a million of converts gave her, and she has used that influence to obtain redress of grievances and to improve the position of the Roman Catholic missionaries. In 1896 formal permission was given for the missions to acquire and hold real estate in any part of China; but a still more important privilege is the one we have mentioned, namely, the giving a recognized official status to the several grades of the priesthood, and so placing them on terms of equality with the local officials. Bishops are to rank with governors of a province, pro-vicars with judges, *taotais*, and so on. International matters are to be discussed and settled locally, and in grave cases appeal is to be made to the minister of the nation "specially entrusted by the Pope with the protection of Roman Catholic missions." This last clause has been repudiated by the British Government as far as its own nationals are concerned. It is apprehended that the privilege, while enhancing the status of the priests, will tend to widen the breach already existing between converts and their fellow-countrymen. The interference of priests in matters of litigation where one of their converts is concerned has often been made matter of complaint, and the fact that they are in effect authorized to interfere is not likely to diminish the friction.

*Instruction.*—Very little was done by the Chinese Government during the period 1875-1900 for the better education of the people. Elementary education is still left to take care of itself. The most noteworthy fact to be noticed is the great number of mission schools that are now maintained in various parts of the Empire. Though insignificant as compared with the vast population, these schools are doing valuable service in imparting a knowledge of English to a small proportion of the youth, who in turn, not infrequently, become instructors to a wider class. But among the great mass of the people the densest ignorance prevails, even as regards their own language and history, and much more as to any knowledge of other countries. In respect of advanced education the Chinese Government has done a little better. There are in most provincial capitals institutions termed colleges, where tutors or professors are maintained at the public expense, and where a limited number of students are admitted. There are also in every district two or three paid officials who are termed directors of studies. Their function, however, is not to teach, but to examine, and they act as registrars of the students entering for the public examinations. The object aimed at is not the general education of the people, but to aid poor and deserving students to pass the examinations, and so enter the public service. The idea of educating the people so as to make them more capable citizens is nowhere to be found, and apparently has never been conceived as one of the duties of Government. At Peking, a college, termed the Tung Wen Kwan, was instituted about 1870. and is still maintained with a staff of foreign professors and teachers. It is mainly a school of languages to enable young Chinese to qualify as interpreters in English, French, etc. Similar schools have been established at Canton, Foochow, and one or two other places, with but indifferent results, and as a factor in the education of the nation they can hardly be said to count. A more promising plan was conceived in 1880, or thereabouts, by the then governor-general of Nanking, who sent a batch of thirty or forty young students to America to receive a regular training, on the understanding that on their return they would receive official appointments. The promise was not kept, however. A report went about that these students were becoming too Americanized. They were hastily recalled, and when they returned they were left in obscurity.

*Native Press.*—In connexion with the subject of education we may notice the growth of a native press, which promises to have an important influence on the development of the nation. The *Peking Gazette*, which is sometimes called the oldest paper in the world, is not a newspaper at all in the ordinary sense, but merely a court gazette for publishing imperial decrees and such public documents as the Government may wish to give out. It never contains original articles nor any discussion of public affairs. The first genuine native newspaper was published at Shanghai about 1870. It was termed the *Shen Pao*, or *Shanghai News*, and was issued under foreign auspices, the first editor being an Englishman. It was some years before it made much headway, but success came, and it was followed by various imitators, some published at Shanghai, some at other treaty ports, and at Hongkong. In 1895 there were eleven native newspapers in circulation, and since then the number has largely increased. There are now some thirty-five in circulation, almost all dailies, of which half are issued from Shanghai. Besides the dailies there are at least as many magazines or other periodicals, most of which are issued from the various mission presses, and several of which are exceedingly well written. The effect of this mass of literature on the public mind of China cannot but be of first-rate importance. It must tend, more than anything else, to dispel the darkness and to promote ideas of reform and progress. The attitude of the central Government towards the native press is somewhat undefined. There are no press laws, but as every official is a law unto himself in these matters, there is nothing to prevent him from summarily suppressing an obnoxious newspaper and putting the editor in prison. The Emperor, among other reform edicts which preceded and provoked the *coup d'état* of 1898, declared that newspapers were a boon to the public, and appointed one of them a Government organ. The Empress-dowager revoked this decree after the deposition of the Emperor, and declared that the public discussion of affairs of state in the newspapers was an impertinence, and ought to be suppressed. The existence of the press, however, is tolerated, and by some officials at least would seem to be encouraged. In any case no interference could be offered to those native papers which are published by foreigners, inasmuch as the latter are, by the extra-territorial clauses of the treaty, exempted from Chinese jurisdiction. The regulation of the press is one of those problems which the Chinese Government has yet to solve.

*Social Condition.*—The social condition of the people relative to European standards must be put as very low. Agriculture is the one great industry. Four-fifths of the population may be put down as peasant cultivators of the soil. Of these fully one-half are small peasant proprietors owning the land they till, subject to the payment of the state taxes. Nearly all the other half hold land on lease, paying rent; and only a comparatively small proportion are agricultural labourers. But whether as proprietors or farmers the holdings are always very small—so small that the condition of the holders is hardly above that of ordinary field labourers. The minute subdivision of the holdings is due to two causes—firstly, over-population; and, secondly, the land laws. As to the latter, the invariable rule of succession is equal division among all male children. Not only is there no primogeniture, but a parent cannot, even if he wished to do so, leave all his land to one son. There must be substantially an equal division, the will of the father notwithstanding. As early marriages and large families are the rule, this process of continual division and subdivision has brought things down to the irreducible minimum in many places. In the *Journal of the China Branch of the Royal Asiatic Society for*

1888 a series of short papers was printed, contributed by missionaries and others living in the interior of the country, describing the social condition of the peasantry. From these it appears that the irreducible minimum is, in the more fertile parts, as low as a sixth of an acre per head. In other words, a family of six persons can make a living out of a farm of one acre. This would make a possible population of 3840 to the square mile. As a matter of fact, the subdivision has in numberless cases been carried even below that limit. Small patches of one-tenth, or even one-twentieth, are to be found as the estate of an individual landowner, and the vast majority of holdings run between one and three acres. With three acres a family is deemed very comfortable, and the possession of ten acres or more means luxury. Three acres is about the largest quantity which one family can manage without employing hired labour. In the northern provinces, where wheat, maize, &c., which do not require irrigation, are grown, five acres can be worked by one household. If the family possesses more land than that the balance is almost invariably let, and always in similar small holdings. Nowhere is the system of farming by capitalists with hired labour to be found. The following is an instance given by one of the writers in the above-named journal, and may be taken as typical of the bulk of the rural population :—

"Pong Hia lives in a village of 300 persons, in which about 30 are landowners. Pong Hia owns more than any other man in his class, having 2 acres (12 mow). His family consists of 10 persons. He is 46 years old, his wife is 41, his son is 22, his son's wife is 22, his four daughters are from 10 to 17, and his two grandchildren are 3 and 8 years old. He and his son till the land, hiring help in harvest-time. The womenfolk weave and make clothing for the family, rear pigs and fowls, and do all the housework. The house in which these ten persons live is worth £12, including the site; the furniture is worth £4 : 10s., the clothing worth about £4. The family lives comfortably upon the produce of the land, and is reckoned affluent."

To this it may be added that land such as the foregoing will yield two, or sometimes three, crops in the year. The spring crop is wheat, sown in November and reaped in April; the summer or principal crop is rice, planted in May and reaped in August or September; and an autumn crop of cabbages, beans, or other green stuff can usually be got in, sometimes overlapping with the wheat. In the southern provinces two rice crops can be got in succession during the summer, besides the winter crop.

It will be gathered from the foregoing that there is no class of wealthy territorial magnates, corresponding to the aristocracy of this and other European countries. The only class which at all resembles them is the class of retired officials. As the bureaucracy monopolize all the power in the country, they generally contrive to monopolize a good deal of the wealth. This is not infrequently invested in land, and consequently there are to be found in most provinces several such families with a country seat and the usual insignia of local rank and influence. On the decease of the heads or founders such families would, in the natural course of things, be broken up and the land divided, but it is considered more dignified for the sons to refrain from dividing, and to live together, sharing the rents and profits in common. This is sometimes continued for several generations, until the country seat becomes an agglomeration of households and the family a sort of clan. A family of this kind, with literary traditions, and with the means to educate the young men, is constantly sending its scions into the public service, who in turn bring their earnings to swell the common funds, while the rank and dignity which they may earn add to the importance and standing of the group as a whole. The members of this class are usually termed the *literati*, or gentry. Though the constitution does not recognize them as having any share in the local government, yet they can exercise an enormous influence in public affairs. The peasantry who farm their lands are, of course, under their control. The official rank which most of the members have acquired by promotion or purchase enables them to resist, and perhaps browbeat, the local officials, while they further terrorize the latter by threatening to denounce them to the Emperor, which they can often manage to do through some one or other of their many relations or marriage connexions who may happen to have the ear of the court. Being usually intensely bigoted and conservative, they present a serious barrier to progress, especially if there is a foreign element in it, such as the introduction of railways, or making of roads, or renting of inland residences by foreign merchants or missionaries. Not infrequently have projects for the improvement of trade, assented to by the local officials, been blocked by the opposition of the gentry, the former not daring to incur their resentment. But such families, unless their wealth is kept up by continual accessions, tend, in course of time, to decline through the levelling operation of the law of succession. As the numbers among whom the wealth must be shared increase rapidly with every generation, a point is soon reached when the individuals of the family are no better off than the peasantry who till their land, and then a break-up is inevitable. If possible, however, the eldest branch preserves the family records and the ancestral hall, some portion of the domain being put in mortmain for this purpose. When scattered, the collateral branches of such a family contrive to keep in touch, the common bond being the ancestral hall and the right to join in the family ancestor-worship. Numerous instances can be found where families no better off than the commonalty can trace their descent back through twenty generations.

*Finance.*—In fiscal matters, as for many other purposes, the Chinese empire is an agglomeration of a number of quasi-independent units. Each province has a complete administrative staff, collects its own revenue, pays its own civil service, pays its own militia and naval forces, and out of the surplus contributes towards the expenses of the imperial Government a sum which varies with the imperiousness of the needs of the latter and with its own comparative wealth or poverty. The imperial Government does not collect directly any part of the revenues, unless we except the imperial maritime customs, though these, too, pass through the books of the provincial authorities. We may also except a few of the old native customs stations which are deemed perquisites of the imperial court, as, for instance, the native custom-house at Canton, Hwei Kwan on the Grand Canal, and various stations in the neighbourhood of Peking. The superintendent of these stations is a nominee of the court, always a Manchu, who makes his returns direct to the throne and not to the governors. But otherwise the court and the central Government in Peking are dependent upon the sums they can levy on the provinces. It has hitherto been extremely difficult to obtain anything like trustworthy figures for the whole revenue of China, for the reason that no statistics are published by the central Government at Peking. The only available data are, first, the returns published by the imperial Maritime Customs for the duties levied on foreign trade; and, secondly, the memorials sent to Peking by the provincial authorities on revenue matters, certain of which are published from time to time in the *Peking Gazette*. These are usually fragmentary, being merely reports which the governor has himself received from his subordinates, detailing, as the case may be, the yield of the land tax or the likin for his particular district, with a dissertation on the causes which have made it more or less than for the previous period. Or the return may be one detailing the expenditure of such and such a department, or reporting the transmission of a sum in reply to a requisition of the Board of Revenue, with a statement of the source from which it has been met. It is only by collating these returns over a long period that anything like a complete statement can be made up. And even then it is quite certain that these returns do not represent anything like the total of taxation paid by the people, but, as far as they go, they may be taken to represent the volume of taxation on which the Peking Government can draw revenue.

The following figures[1] give as nearly as can be done the actual revenue of the Chinese empire as returned by the responsible officers of Government :—

| | |
|---|---|
| 1. Land tax in silver . . . . | Taels 25,000,000 |
| 2. ,, ,, (in grain) value . . | 6,500,000 |
| 3. Salt tax . . . . . | 13,500,000 |
| 4. Likin . . . . . . | 13,000,000 |
| 5. Foreign maritime customs . . | 22,500,000 |
| 6. Native customs . . . | 2,000,000 |
| 7. Duty on native opium . . . | 2,200,000 |
| 8. Miscellaneous . . . . | 5,500,000 |
| Total . . . . . | Taels 90,200,000 |

Equal to £13,530,000.

*Sources of Revenue.*—1. *Land Tax.*—In China, as in most Oriental countries, the land has from time immemorial been the mainstay of the revenue. In the early years of the present dynasty there was levied along with the land tax a poll tax on all adult males, but in 1712 the two were amalgamated, and the whole burden was thrown upon land, families not possessing land being thereafter exempted from taxation. At the same time it was decreed that the amount of the land tax as then fixed should be permanent and settled for all time coming. As a matter of fact it would appear from the records that this promise has been kept as far as the central Government has been concerned. In all its many financial difficulties it does not seem ever to have tried to increase the revenue by raising the land tax. The amount of tax leviable on each plot is entered on the title deed, and, once entered, it cannot be changed. The tax on almost all lands is thus stated to be so much in silver and so much in rice, wheat, or whatever the principal crop may be. Except in two provinces, however, the grain tax is now commuted and paid in silver. The exceptions are the provinces of Kiangsu and Chekiang, which still

[1] Throughout this article the tael spoken of is the Haikwan tael, the present value of which is about 3s. It fluctuates with the value of silver.

send forward their taxes in grain. This is despatched in bulk through a department of the Government to Peking, where it is distributed as rations among the Manchu soldiery and retainers in and about the capital. The value of the grain forwarded (generally called tribute rice) is estimated to amount to taels 6,500,000. The total collection in silver, as reported by the responsible officials, amounts in round numbers to taels 25,000,000. The total yield of the land tax, therefore, is taels 31,500,000, or say £4,725,000. It will readily be granted that for such a large country as China this is a very insignificant one. In India the land tax yields £17,000,000, and China has undoubtedly a larger cultivated area, a larger population, and soil that is on the whole more fertile; but it is certain that this sum by no means represents the amounts actually paid by the cultivators. It is the sum which the various magistrates and collectors have to account for and remit in hard cash. But as nothing is allowed them for the costs of collection, they add on a percentage beforehand to cover the cost. This they usually do by declaring the taxes leviable not in silver, but in copper "cash," which indeed is the only currency that circulates in country places, and by fixing the rate of exchange to suit themselves. Thus while the market rate is, say, 1500 cash to the tael, they declare by general proclamation that for tax-paying purposes cash will be received at the rate of 3500 or 4000 to the tael. Thus while the nominal land tax in silver remains the same it is in effect doubled or trebled, and, what is worse, no return is made or account required of the extra sums thus levied. Each magistrate or collector is in effect a farmer. The sum standing opposite the name of his district is the sum which he is bound to return under penalty of dismissal, but all sums which he can scrape together over and above are the perquisites of office less his necessary expenses. Custom, no doubt, sets bounds to his rapacity. If he went too far he would provoke a riot; but one may safely say there never is any reduction, what change can be effected being in the upward direction. What the actual sums may be which are thus levied and not accounted for it is impossible to tell, but a rough idea may be gathered from a calculation of the probable area under cultivation and the average actual payment. The area of the eighteen provinces constituting China proper is roughly 1,300,000 square miles, and assuming that one-fourth of this is under cultivation, we should have a taxable area of over 300,000 square miles, say 190,000,000 acres, which is probably under the mark. According to the best information obtainable a moderate estimate of the sums actually paid by the cultivators would give two shillings per acre. This for the eighteen provinces should give £19,000,000 as being actually levied, or more than four times what is returned.

2. *The Salt Duty.*—The trade in salt is a Government monopoly. Only licensed merchants are allowed to deal in it, and the import of foreign salt is forbidden by the treaties. For the purpose of salt administration China is divided into seven or eight main circuits, each of which has its own sources of production. Each circuit has carefully-defined boundaries, and salt produced in one circuit is not allowed to be consigned into or sold in another. There are great differences in price between the several circuits, but the consumer is not allowed to buy in the cheapest market. He can only buy from the licensed merchants in his own circuit, who in turn are debarred from procuring supplies except at the depot to which they belong. Conveyance from one circuit to another is deemed smuggling, and subjects the article to confiscation.

Duty is levied under two heads, the first being a duty proper payable on the issue of salt from the depot, and the second being likin levied on transit or at the place of destination. The two together amount on an average to about taels 1.50 per picul of 133⅓ ℔ or 3s. 9d. per cwt. The total collection returned by the various salt collectorates amounts to taels 13,500,000 (£2,025,000) per annum. The total consumption of salt for all China is estimated at 25 million piculs, or nearly 1½ million tons, which is at the rate of 9 ℔ per annum per head of the population. If the above amount of taels 1.50 were uniformly levied and returned, the revenue ought to be 37½ million taels instead of 13½.

3. *Likin on General Merchandise.*—By the term likin is meant a tax on inland trade levied while in transit from one district to another. It was originally a war tax imposed as a temporary measure to meet the military expenditure required by the Taiping and Mahommedan rebellions of 1850-70; but the Government has never been able to dispense with it since, and it is now one of the permanent sources of income. In the present disorganized condition of China it would perhaps be difficult to impose any other form of taxation which would yield a like return, but at the same time it is in form as objectionable as a tax can be, and is equally obnoxious to the native as to the foreign merchant. Tolls or barriers are erected at frequent intervals along all the principal routes of trade, whether by land or water, and a small levy is made at each on every conceivable article of commerce. The individual levy is small, but over a long transit it may amount to 15 or 20 per cent. The objectionable feature is the frequent stoppages with overhauling of cargo and consequent delays. By treaty foreign goods may commute all transit dues for a single payment of one-half the import tariff duty, but this stipulation is but indifferently observed, giving rise to frequent complaints on the part of foreign merchants. The difficulty in securing due observance of this treaty right lies in the fact that the likin revenue is claimed by the provincial authorities, and the transit dues when commuted belong to the central Government, so that the former are interested in opposing the commutation by every means in their power. As a further means of neutralizing the commutation they have devised a new form of impost, viz., a terminal tax which is levied on the goods after the termination of the transit. The amount and frequency of likin taxation are fixed by provincial legislation—that is, by a proclamation of the governor. The levy is authorized in general terms by an imperial decree, but all details are left to the local authorities, who in this, as in all other matters, have a general legislative power. The yield of this tax is estimated at present at taels 13,000,000 (£1,950,000), a sum which probably represents one-third of what is actually paid by the merchants, the balance being costs of collection.

4. *The Imperial Maritime Customs.*—The Maritime Customs is the one department of finance in China which is managed with probity and honesty, and this it owes to the fact that it is worked under foreign control. It collects all the duties leviable under the treaties on the foreign trade of China, and also all duties on the coasting trade so far as carried on by vessels of foreign build, whether Chinese or foreign-owned. It does not control the trade in native craft, the so-called junk trade, the duties on which are still levied by the native custom-house officials. By arrangement between the British and Chinese Governments, the foreign customs levy at the port of entry a likin on Indian opium of 80 taels per chest, in addition to the tariff duty of 30 taels. This levy frees the opium from any further duty on transit into the interior. The revenue of the Maritime Customs has risen from taels 11,000,000 in 1873, to taels 22,500,000 in 1898. In sterling figures, however, it would seem to have fallen, owing to the fall in the gold price of silver. The revenue of 1873, converted into gold at the exchange of the day, was about £3,666,000, whereas that of 1898 would only give £3,375,000. From the point of view of the Chinese Government, which values everything in silver, the revenue has satisfactorily increased.

5. *Native Customs.*—The administration of the Native Customs continues to be similar to what prevailed in the Maritime Customs before the introduction of foreign supervision. Each collector is constituted a farmer, bound to account for a fixed minimum sum, but practically at liberty to retain all he may collect over and above. If he returns more he may claim certain honorary rewards as for extra diligence, but he generally manages to make out his accounts so as to show a small surplus, and no more. Only imperfect and fragmentary returns of the native collectorates have been published, but the total revenue accruing to the Chinese Government from this source does not appear much to exceed two million taels (£300,000). It is believed that if this department were included in the purview of the foreign staff of the Maritime Customs the sum might easily be trebled.

6. *Duty on Native Opium.*—The growth and manufacture of opium was up till recent years forbidden by the laws of China. It was, however, openly connived at by the officials in several provinces, especially in the south-west, where indeed it seems to have been cultivated from time immemorial, and its taxation formed a main source of their income. The restrictions are now withdrawn, and the central Government have been endeavouring to appropriate the taxation to their own uses. The collection remains in the hands of the provincial officials, but they are required to render a separate account of duty and likin collected on the drug, and to hold the sum at the disposal of the Board of Revenue. Opium is pre-eminently a fit article of taxation, and if the levy were faithfully carried out at a rate corresponding, *ad valorem*, to that which is levied on Indian opium, it would give a revenue sufficient to enable the Government to remit the whole likin taxation on internal trade. The annual import into China of Indian opium amounts to about 50,000 chests, on which the Chinese Government receives from duty and likin combined about 5½ million taels (£825,000). The total amount of native-grown opium is estimated at about 400,000 chests (53,000,000 ℔), and if this were taxed at taels 60 per chest, which in proportion to its price is a similar rate to what is levied on Indian opium, it should give a revenue of 24 million taels. Compared with this the sums actually levied, or at least returned by the local officials as levied, are insignificant. The returns so far as published give a total levy for all the eighteen provinces of only taels 2,200,000 (£330,000).

7. *Miscellaneous.*—Besides the foregoing, which are the main and regular sources of income, the provincial officials levy sums which must in the aggregate amount to a very large figure, but which hardly find a place in the returns. The principal are land transfer fees, pawnbrokers' and other licenses, duties on reed flats, commutation of corvée and personal services, &c. The fee on

land transfers is 3 per cent., and it could be shown, from a calculation based on the extent and value of the arable land and the probable number of sales, that this item alone ought to yield an annual return of between one and two millions sterling. Practically the whole of this is absorbed in office expenses. Under this heading should also be included certain items which, though not deemed part of the regular revenue, have been so often resorted to that they cannot be left out of account. These are the sums derived from sale of office or of brevet rank, and the subscriptions and benevolences which under one plea or another the Government succeeds in levying from the wealthy. Raising money by sale of title or official rank has long been and still is a favourable device for special emergencies, such as the great famine in Shansi, the inundation of the Yellow river, and so forth, the sale being stopped when the emergency has passed. But excluding these, the Government is always ready to receive subscriptions, rewarding the donor with a grant of official rank entitling him to wear the appropriate "button." The right is much sought after, and indeed there are very few Chinamen of any standing that are not thus decorated, for not only does the button confer social standing, but it gives the wearer certain very substantial advantages in case he should come into contact with the law courts. The minimum price for the lowest grade is taels 120 (£18), and more of course for higher grades. The proceeds of these sales go directly to the Peking Government, and do not as a rule figure in the provincial returns. The total of the miscellaneous items accruing for the benefit of the Government is estimated at taels 5,500,000.

*Expenditure.*—In regard to expenditure, a distinction has to be drawn between that portion of the revenue which is controlled by the central Government, and that controlled by the several provincial authorities. In theory, no doubt, the imperial Government is supreme, and can spend the revenue of the nation in any way it chooses, but in practice it is not so. As the provinces collect the revenue, and as the authorities there are held responsible for the peace, order, and good government of their respective territories, it follows that the necessary expenses of the provinces form a sort of first charge on the revenue. If the Peking Government asks for more than the province can afford, they simply cannot get it. The order is not, in so many words, refused, it is simply disregarded, and the Peking Government have no means of enforcing it. The method of working is as follows:—The Board of Revenue at Peking, which is charged with a general supervision of finance matters all over the empire, makes up at the end of the year a general estimate of the funds that will be required for imperial purposes during the ensuing year, and apportions the amount among the several provinces and the several collectorates in each province. The estimate is submitted to the Emperor, and, when sanctioned, instructions are sent to all the viceroys and governors in that sense, who, in turn, pass them on to their subordinate officers. In ordinary times these demands do not materially vary from year to year, and long practice has created a sort of equilibrium between imperial and provincial demands. The remittances to the capital are, as a rule, forwarded with reasonable regularity, mostly in the form of hard cash, and though there are frequent complaints of the falling-off of revenue, yet, by good luck, some other fund is found to have a little to spare, and the amount can be made up. It would, indeed, appear to be the cue of every governor to minimize the resources of his own province as much as possible, so as to stave off importunate demands from Peking, and get them foisted on to some other province. Hence the frequent references to the Taiping rebellion (a favourite stalking-horse, though now a generation old), the lamentations over the falling-off of revenue, and the decaying state of the province—all for the most part fictions of the imagination. There is thus a constant pull going on between Peking and the provinces—the former always asking for more, the latter resisting and pleading impecuniosity, yet generally able to find the amounts required, or at all events a percentage. Whatever the provinces can retain can be spent practically as they choose. The Peking control over local expenditure is very feeble, though nominal accounts are rendered.

The expenses which the central Government has to meet are:—(1) Imperial household; (2) Pay of the Manchu garrison in and about Peking; (3) Costs of the civil administration in the capital; (4) Pay of the foreign drilled troops termed the army of the North as distinct from the provincial troops (*vide* "Army" below); (5) The admiralty so far as regards the northern squadron; (6) Naval dockyards, forts, guns, &c.; (7) Foreign loans—interest and sinking fund. To meet all these charges the Peking Government has, for some years past, drawn on the provinces for about taels 20,000,000 (£3,000,000), including the value of the tribute rice, which goes to the support of the Manchu bannermen. No estimates are furnished of the sums allowed under each heading. The imperial household appears to receive in silver about taels 1,500,000 (£225,000), but it draws besides large supplies in kind from the provinces, *e.g.*, silks and satins from the imperial factories at Soochow and Hangchow, porcelain from the Kiangsi potteries, &c., the cost of which is defrayed by the provinces. The imperial Government has also at its disposal the revenue of the Foreign Customs. Prior to the Japanese war this revenue, which, after allowing for the costs of collection, amounted to about 20,000,000 taels (£3,000,000), was nominally shared with the provinces in the proportion of four-tenths and six-tenths. It was from this fund mainly that means were found to equip and maintain the northern fleet (almost extinguished by the Japanese war), to build the forts of Port Arthur and Wei-hai-wei (now also lost to the nation), and to keep going the several arsenals recently established. But the whole of the customs revenue being now pledged to foreign bondholders (*vide* "External Debt"), and absorbed by the service of the several loans, funds for these and the like purposes must now be procured, if at all, elsewhere. An entire readjustment of revenue and expenditure is manifestly necessary, but what form it will take remains to be seen. But besides supplying its own wants the imperial Government has to provide for outlying portions of the empire which are unable to maintain themselves—(1) Manchuria; (2) Kansuh and the central Asian dominion; (3) the south-western provinces of Yunnan and Kwaichow. Manchuria, or, as it is termed, the north-east frontier defence, costs about 2,000,000 taels over and above its own resources. The central Asian territories have from time to time absorbed enormous sums, and even yet constitute a drain on the imperial Government of about 4,000,000 taels a year. This is met by subsidies from Szechuen, Shansi, Honan, and other wealthy provinces. Yunnan, Kweichow, and Kwangsi require aids aggregating 2,000,000 taels to keep things going.

A rough analysis of the expenditure of the Chinese empire, as it stood at the commencement of the Japanese war, would show the following division:—

*Expenditure* 1894.

| | Taels. |
|---|---|
| Imperial household | 1,500,000 |
| Central administration, pay of banner troops and foreign drilled forces | 19,500,000 |
| Board of Admiralty (Peiyang squadron) | 5,000,000 |
| Southern naval squadron | 5,000,000 |
| Forts, guns, and coast defence | 8,000,000 |
| Defence of Manchuria | 2,000,000 |
| Kansuh and Central Asia | 4,000,000 |
| Aids to Yunnan and Kweichow | 1,600,000 |
| Interest and repayment of foreign loans | 2,500,000 |
| Railway construction | 500,000 |
| Public works, river embankments, &c. | 1,500,000 |
| Customs administration, including maintenance of lighthouses, beacons, revenue cruisers | 2,500,000 |
| General administration of eighteen provinces | 36,600,000 |
| | 90,200,000 |

*External Debt.*—Prior to the Japanese war the foreign debt of China was almost nil. A few trifling loans had been contracted at 7 and 8 per cent., but they had been punctually paid off, and only a fraction of one remained. The expenses of the war, however, and the large indemnity of 230,000,000 taels (£34,500,000) which Japan exacted, forced China for the first time into the European market as a serious borrower. The foreign loans contracted up to 1900 amounted altogether to [illegible], bearing interest mostly at 5 per cent. Some of the earlier and smaller issues carry 6 and 7 per cent., and one of £16,000,000 guaranteed by the Russian Government carries 4 per cent. This last was raised in Paris, the others were all made in London through the Hongkong and Shanghai Bank. The charges for interest and sinking fund, which amount to over £3,000,000, are secured on the revenue of the Maritime Customs, and on the likin taxes of certain specified provinces. At present the net income from these two sources amounts to over taels 24,000,000, equivalent at present rate of exchange to £3,400,000, which is amply sufficient. Besides the foregoing, the Chinese Government recently borrowed £2,300,000 for railway extension, also at 5 per cent., the charges on which are secured on the revenue of the Imperial Northern Railway (*vide* "Railways.")

There is no internal debt worth mentioning. The Chinese Government have several times attempted to borrow money in their own country, offering Government bonds as security, but uniformly without success. It is felt that no reliance can be placed on the good faith of the Government towards its own subjects, and no machinery exists whereby payment could be enforced in case of default.

*Defence—Army.*—The Chinese constitution provides for two independent sets of military organizations—namely, the Manchu army and the several provincial armies. On the establishment of the dynasty in 1644, the victorious troops, composed mainly of Manchus, but including also Mongols and Chinese, were permanently quartered in Peking, and constituted a hereditary national army. The force was divided into eight banners, and under one

or other of these all Manchus and all the descendants of the members of other nationalities are yet enrolled. They form the bulk of the population of the "Tartar city" of Peking. Each adult male is by birth entitled to be enrolled as a soldier, and by virtue of his enrolment has a right to draw rations—*i.e.*, his allowance of the tribute rice, whether on active service or not. Detachments from one or other of the banners were also stationed as garrisons in the chief provincial centres, as at Canton, Foochow, and Hangchow, &c., and their descendants still occupy the same position. They are, like their kinsmen in Peking, entitled to draw a pittance from the provincial taxes as rations. Both in the capital and in the provinces the Manchu garrisons are exempt from the jurisdiction of the local authorities, and are justiciable only before their own officers. As a fighting force the Manchu garrisons both in the capital and in the provinces have long become quite effete. In the capital, however, the *élite* of the Manchu soldiery have been formed into a special corps termed the Peking Field Force. Its nominal strength is 20,000, the men are armed and drilled after the European fashion, and fairly well paid. There are other corps of picked Manchus better paid and better armed than the ordinary soldier, and it is computed that the Manchu army in or near Peking could muster 75,000, all more or less efficient. The second organization is termed the army of the Green Standard, being the Chinese provincial forces. The nominal strength is from 20,000 to 30,000 for each province, or about 500,000 in all; the actual strength is about one-third of this. They are enrolled for the purpose of keeping the peace within their own province, and resemble a militia or local constabulary rather than a national army. They are distributed in small camps or garrisons in the principal towns, and the most serious duty they are likely to be called on to perform is that of putting down a local rebellion. The bulk of each provincial army is under the command of a general-in-chief, but certain brigades are under the orders of the governor and the governor-general. They are generally poorly paid and equally badly drilled and armed. As a fighting force they are of no practical account.

The only real fighting force which China possesses is made up of certain special corps which are not provided for in the constitution, and which consequently used to be termed *yung*, "braves" or irregulars, but which have now acquired various distinctive names. They are enlisted for service generally, and have all had some smattering of foreign drill. They are also fairly well paid and armed. Since the Japanese war these corps have been quartered near Peking and Tientsin, and are generally spoken of as the army of the North. They are now grouped in five divisions under the command of Generalissimo Jung Lu, and are supposed to number 75,000 men. In addition to these the Government could count on 20,000 men more who are now scattered in garrisons in Manchuria.

*Navy.*—Since the destruction of the northern fleet by the Japanese at the capture of Wei-hai-wei in 1895, the Chinese navy may be said to be non-existent. It formerly consisted of two divisions, the northern and the southern, of which the former was by far the more formidable. The southern was under the control of the viceroy of Nanking, and took no part in the Japanese war. While the northern fleet was grappling in a death-struggle, the southern was lying snugly in the Yangtse waters, the viceroy of Nanking apparently thinking that as the Japanese had not attacked him there was no reason why he should risk his ships. Since the close of the war an attempt has been made to restore the northern fleet, which now consists of five small cruisers and a few torpedo boats. The southern squadron consists of seven small cruisers, old-fashioned, and four torpedo boats. The viceroys of Foochow and Canton possess a few gunboats meant to repress piracy, but of no fighting value.

*Arsenals and Dockyards.*—Since the loss of Port Arthur, China possesses no dockyard except a small one at Foochow, which cannot dock vessels over 3000 tons. Many years ago the Chinese Government established at Foochow a shipbuilding yard, placing it in the hands of French engineers. Training schools both for languages and practical navigation were at the same time organized, and a training ship was procured and put under the command of a British naval officer. Some twenty-five or thirty small vessels were built in the course of as many years, but gradually the whole organization was allowed to fall into decay. Except for petty repairs this establishment is valueless to the Chinese Government. Well-equipped arsenals have been established at Shanghai and at Tientsin, but as they are both placed up shallow rivers they are useless for naval repairs. Both are capable of turning out heavy guns, and also rifles and ammunition in large quantities. There are also military arsenals at Nanking, Wuchang, Canton, and Chengtu, besides smaller establishments at other provincial centres.

*Forts.*—A great number of forts and batteries have been erected along the coast and at the entrance to the principal rivers. Chief among these, now that the Taku forts formerly commanding the entrance to Tientsin have been demolished, are the Kiangyin forts commanding the entrance to the Yangtse, the Min forts at the entrance of the Foochow river, and the Bogue forts at the entrance to the Canton river. These are supplied with heavy armament from the Krupp and Armstrong factories, but the garrisons share the weakness common to all Chinese military establishments.

*Production and Industry: Minerals.*—The Chinese Government has hitherto shown a great repugnance to permitting foreign companies to work minerals in any part of the country. As a consequence very little is known of the actual resources of the empire, which, however, are believed to be very great. A Bureau of Mines, however, has been created with a view to granting concessions, and probably much progress will be made in the near future.

*Coal.*—This mineral is worked on foreign principles at only one place, viz., the Kaiping collieries in the north-east of the province of Chihli. The mines are connected with the seaport of Taku by a railway. The coal is a soft bituminous coal with a large proportion of dust. The output is about 1,500,000 tons per annum. A mine has also been opened in the province of Hupeh, about 60 miles below Hankow, and near the Yangtse, in connexion with the iron-works recently erected by the viceroy of that province. Numerous small mines have been worked for a long period by the natives in the province of Hunan. There are two principal local fields in this province, one lying in the basin of the Lui river and yielding anthracite, and the other in the basin of the Siang river yielding bituminous coal. Both rivers drain into the Yangtse, and there is thus an easy outlet by water to Hankow. The quality of the coal, however, is inferior, as the stratification has been much disturbed, and the coal seams have been in consequence crushed and broken. No statistics of the output are obtainable, but it is estimated to be over 300,000 tons per annum—mostly destined for local consumption. The largest coal-field in China lies in the province of Shansi. Coal and iron have here been worked by the natives from time immemorial, but owing to the difficulty of transport they have attained only a limited local circulation. The whole of southern Shansi, extending over 30,000 square miles, is one vast coal-field, and contains, according to the estimate of Baron von Richthofen, enough coal to last the world at the present rate of consumption for several thousand years. The coal seams, which are from 20 to 36 feet in thickness, rest conformably on a substructure of limestone. The stratification is throughout undisturbed and practically horizontal. As the limestone bed is raised some 2000 feet above the neighbouring plain the coal seams crop out in all directions. Mining is thus carried on by adits driven into the face of the formation, rendering the mining of the coal extremely easy. The coal-field is divided into two by a mountain range of ancient granitic formation running north-east and south-west, termed the Hoshan. It is of anterior date to the limestone and coal formations, and has not affected the uniformity of the stratification, but it has this peculiarity, that the coal on the east side is anthracite, and that on the west side is bituminous. A concession to work coal and iron in certain specified districts in this area has been granted to a British company, together with the right to connect the mines by railway with water navigation, and it is expected that important developments will follow on this grant. At present the mines, in default of railway facilities, are practically valueless. At the pit's mouth coal can be had for a shilling a ton, but as transport costs from 2½d. to 5d. per ton per mile, the price becomes prohibitive after a short distance. In spite of these drawbacks the present output must be considerable, considering the great area and the number of openings that are being worked, but it is impossible to state it with any degree of accuracy. There are various other sources of coal-supply, such as the western hills near Peking, many parts of Szechuen, and some districts in Shantung and Kwangtung, which, however, do not call for detailed notice. It may, indeed, be said generally that there is hardly a province which does not possess coal mines more or less valuable—the one drawback to their development being the absence of railways.

*Iron.*—Iron ore of various qualities is found almost as widely diffused as coal. The districts where it is most worked at present lie within the coal-field of Shansi, viz., at Tse-chou-fu and Ping-ting-chou. The ore is a mixture of clay iron ore and spathic ore, together with limonite and hematite. It is found abundantly in irregular deposits in the Coal Measures, and is easily smelted by the natives in crucibles laid in open furnaces. This region supplies nearly the whole of north China with the iron required for agricultural and domestic use. The out-turn must be very considerable, but no data are available for forming an accurate estimate. The province of Szechuen also yields an abundance of iron ores of various kinds. They are worked by the natives in numerous places, but always on a small scale and for local consumption only. The ores occur in the Coal Measures, predominant among them being a clay iron ore. Hunan, Fuhkien, Chekiang, and Shantung all furnish iron ores, but only a petty industry is carried on at any one place.

Of other minerals *copper* comes next in importance. It is found chiefly in the provinces of Kweichow and Yunnan, where a rich belt of copper-bearing ores is found running east and west

across both provinces, and including south Szechuen. The chief centres of production are at the cities of Tung-chuan-fu, Chao-tung, and Ning-yuan. The mines are worked as a Government monopoly, private mining being nominally prohibited. No concessions have so far been granted to foreign companies. The output is considerable, but no statistics are published by Government. The supply is not, however, enough to meet the requirements of the country, as foreign copper is imported to the extent of about 28,000 tons a year. It is generally supposed that if the mines were thrown open to foreign enterprise, not only would the home demand be met, but there would be a large available supply for export.

*Precious Metals.*—There is no known source of supply in China proper where gold and silver are worked to any appreciable extent. A little gold washing is done in the sandy beds of certain rivers, for instance, the Han river and the upper Yangtse, above Suifu, which here goes by the name of the "Goldsand" river. The amount so extracted is extremely small and hardly pays the labour of washing, but the existence of gold grains points, no doubt, to a matrix higher up. The whole of south-western China has the reputation of being highly metalliferous, and it is probable that valuable deposits may be found when permission to prospect has been granted by the Chinese Government. Gold is obtained, however, in some quantities on the upper waters of the Amur river, on the frontier between China and Siberia. The washings are carried on by Chinese, no foreigners so far having been allowed to participate. Gold has also been found in quartz veins at Ping-tu, in the province of Shantung, but hardly in paying quantities.

*Manufactures.*—In regard to manufactures the only point to be noticed is the recent establishment of cotton spinning and weaving mills by foreign companies at Shanghai. Permission to carry on this industry was refused to foreigners until the right was secured by the Japanese treaty following on the war. Some native-owned mills had been working before that date, and were reported to have made large profits. Eight mills with an aggregate of 300,000 spindles are now working, five of which are under foreign management. There are also four or five mills at one or other of the ports working 80,000 spindles more. These mills are all engaged in the manufacture of yarn for the Chinese market, very little weaving being done. Chinese-grown cotton is used, the staple of which is short, and only the coarser counts can be spun. So far these mills have not had the financial success which was predicted for them, but many of the initial difficulties were due to inexperience, and it is probable that the cotton manufacturing industry in China will attain considerable proportions. The only other manufacture that deserves mention is that of silk weaving. This is carried on solely by native looms, and chiefly in the cities of Hangchow, Soochow, and Nanking. The native looms have long been famous for their beautiful silks and brocades. The greater part is destined for home consumption, but there is now also a considerable export. In 1898 the export of silk piece goods amounted in value to £1,400,000. The reeling of silk cocoons by steam machinery has also come into vogue in recent years, and is gradually supplanting the native methods. Notwithstanding the large foreign importations the spinning and weaving of cotton on native hand-looms is still carried on almost universally. The whole of the large import of Indian yarn, as well as that locally manufactured, is worked up into cloth by the women of the household. Four-fifths of the clothing of the lower classes is supplied by this domestic industry.

*Commerce.*—The progress of the foreign trade of China is set out in the following table. The values are given both in currency and sterling, but it is to be remarked that during the period when silver was falling, that is from 1875 to 1893, the silver valuation represents much more accurately variations in the volume of trade than does the gold valuation. Gold prices fell continuously during this period, while silver prices were nearly constant. Since 1893 silver prices have tended to rise, and the gold valuation is then more accurate. The conversion from silver to gold is made at the rate of exchange of the day, and therefore varies from year to year

*Table of Imports and Exports, exclusive of Bullion.*

| Year. | Imports. | | Exports. | |
|---|---|---|---|---|
| | Value in Taels. | Equivalent in Sterling. | Value in Taels. | Equivalent in Sterling. |
| 1875 | 66,344,000 | £19,903,000 | 77,308,000 | £23,193,000 |
| 1880 | 76,689,000 | 22,368,000 | 87,694,000 | 25,582,000 |
| 1885 | 84,803,000 | 22,618,000 | 73,899,000 | 19,206,000 |
| 1890 | 113,082,000 | 29,213,000 | 96,695,000 | 24,980,000 |
| 1895 | 154,685,000 | 25,136,000 | 154,964,000 | 25,181,000 |
| 1896 | 184,897,000 | 25,816,000 | 141,685,000 | 23,114,000 |
| 1897 | 185,194,000 | 27,779,000 | 175,229,000 | 26,284,000 |
| 1898 | 189,991,000 | 28,498,000 | 170,743,000 | 25,612,000 |

The distribution of the trade among the various countries of the world is shown in the following table:—

*Imports into China.* (000's omitted.)

| Imports from | 1875. | 1880. | 1885. | 1890 | 1895. | 1898. |
|---|---|---|---|---|---|---|
| Un. Kingdom | £6,340 | £6,382 | £6,396 | £6,357 | £5,518 | £5,244 |
| Hongkong . | 8,282 | 8,829 | 9,404 | 18,615 | 14,331 | 14,582 |
| India . . . | 4,451 | 6,039 | 4,306 | 2,661 | 2,753 | 2,870 |
| Other British Possessions | 396 | 346 | 542 | 571 | 732 | 721 |
| United States | 304 | 351 | 884 | 949 | 827 | 2,574 |
| Continent of Europe (except Russia) | 230 | 671 | 671 | 638 | 1,227 | 1,410 |
| Russia in Europe . . | ... | ... | ... | 177 | 291 | 218 |
| Russia in Asia | 30 | 50 | 52 | 54 | 18 | 45 |
| Japan . . . | 746 | 1,021 | 1,404 | 1,909 | 2,794 | 4,156 |

*Exports from China.* (000's omitted.)

| Exports to | 1875. | 1880. | 1885. | 1890. | 1895. | 1898. |
|---|---|---|---|---|---|---|
| United Kingdom | £8,749 | £8,125 | £5,864 | £3,383 | £1,718 | £1,607 |
| Hongkong . . | 3,824 | 4,844 | 4,232 | 8,507 | 5,651 | 9,312 |
| India . . . . | 72 | 323 | 157 | 273 | 449 | 198 |
| Other British Possessions. . | 948 | 874 | 818 | 886 | 586 | 558 |
| United States . | 2,302 | 2,906 | 2,213 | 2,109 | 2,499 | 1,798 |
| Continent of Europe (except Russia) . . . | 2,524 | 3,760 | 1,948 | 3,004 | 3,440 | 3,889 |
| Russia in Europe | 411 | 8 | 252 | 959 | 727 | 751 |
| Russia in Asia . | 928 | 1,252 | 1,041 | 1,329 | 1,808 | 1,919 |
| Japan . . . . | 586 | 642 | 398 | 1,248 | 2,408 | 2,414 |

The principal exports from the United Kingdom to China are cotton piece goods, woollen manufactures, metals, and machinery. China is next to India the greatest consumer of Manchester goods. The export of plain cotton goods to China and Hongkong has for some years averaged 500,000,000 yards per annum. The only competitor which Great Britain has in this particular branch of trade is the United States of America, which within recent years has been supplying China with very large quantities of cotton goods. In [illegible] China imported 70,000,000 yards of American-made goods, but in 1898 the import had risen to 165,000,000 yards. The value in sterling of the total imports into China from the United Kingdom has remained nearly constant for the last 25 years, but inasmuch as the gold prices have been falling the volume of the export has been in reality steadily growing. The imports into England, however, of Chinese produce have fallen off enormously, mainly through the fact that China tea has been driven out of the English market by the growth of India and Ceylon, and also because the bulk of the China silk is now shipped directly to Lyons and other Continental ports instead of to London as formerly was the rule. The growth of the import of Indian yarn into China has been very rapid. In 1884 the import was 35,000,000 lb and in 1898 it reached 188,000,000 lb. Arranged in categories the imports into China from all foreign countries for the year 1898 were as follows:—

| | |
|---|---|
| Cottons and cotton yarn . . . | £11,012,000 |
| Woollen manufactures . . . | 440,000 |
| Metals and machinery . . . | 1,600,000 |
| Petroleum . . . . . . . | 1,600,000 |
| Opium . . . . . . . | 3,460,000 |
| Sundries . . . . . . . | 10,370,000 |
| Total . . . | £28,482,000 |

The principal exports from China are silk and tea. These two articles, indeed, up to 1880 constituted more than 80 per cent. of the whole export. Owing, however, mainly to the fall in silver, and partly also to cheap ocean freights, it has become profitable to place on the European market a vast number of miscellaneous articles of Chinese produce which formerly found no place in the returns of trade. The silver prices in China did not change materially with the fall in silver, and Chinese produce was thus able to compete favourably with the produce of other countries. The following table shows the relative condition of the export trade in 1880 and 1898:—

| Exports of | 1880. | 1898. |
|---|---|---|
| Silk . . . | £9,750,000 | £9,074,000 |
| Tea . . . | 11,774,000 | 4,178,000 |
| Miscellaneous . | 4,058,000 | 12,360,000 |
| Total . . | £25,582,000 | £25,612,000 |

In the miscellaneous class the chief items of export are beans and beancake, £1,524,000; raw cotton, £473,000; hides, £562,000; mats and matting, £552,000; oils, £475,000; furs and skin rugs, £461,000; sugar, raw, £311,000; tobacco, £576,000; strawbraid, £470,000; and wool, £214,000. The export of all cereals except pulse is forbidden.

*Movements of Bullion.*—The following table shows the export and import of the precious metals for the past eleven years. The *net* import or export only is given.

| | Imports, Value in H. Taels. | | Exports, Value in H. Taels. | |
|---|---|---|---|---|
| | Gold H. Tls. | Silver H. Tls. | Gold H. Tls. | Silver H. Tls. |

| 1898 | ... | 4,722,000 | 7,704,000 | |
| Total 11 years | ... | 87,035,000 | 67,298,000 | 13,406,000 |

There has thus been over the whole period a net import of silver of H. taels 73,629,000, equivalent to about 95,000,000 ounces. Nearly the whole of this, however, was imported during the years 1894-95, and was the proceeds of loans raised by the Chinese Government in Europe to meet the costs of the Japanese war. Very little comes into China in discharge of the annual balance of trade, inasmuch as the exports, including gold, and imports nearly counterbalance each other. There is a regular export of gold amounting on an average to about a million sterling per annum. A part of it would seem to be the hoardings of the nation brought out by the high price of gold in terms of silver, but a part is virgin gold derived from gold workings in Manchuria on the upper waters of the Amur river.

*Shipping and Navigation.*—All the foreign trade of China and a great part of the coasting trade is carried on by foreign-owned vessels. The only Chinese-owned steamers are those of the China Merchants' Steamship Company, which has its headquarters at Shanghai, and a few colliers belonging to the Kaiping Mining Company. The following table shows the nationality and tonnage of the vessels entering and clearing at the ports of China for 1898:—

| Flag. | Tonnage entered and cleared. | Percentage of total foreign. |
|---|---|---|
| British | 21,265,966 | 81·7 |
| German | 1,685,098 | 6·5 |
| Japanese | 1,569,134 | 6 |
| French | 420,078 | 1·6 |
| American | 239,152 | 0·9 |
| Russian | 178,768 | 0·7 |
| Other Powers | 686,812 | 2·6 |
| Total foreign tonnage | 26,045,008 | 100 |

In addition to the foregoing, 8,187,572 tons of Chinese-owned shipping entered and cleared at the open ports during 1898. These were wholly small vessels engaged in the coasting trade.

*Treaty Ports.*—In addition to the coast and river ports declared open to foreign trade under the treaty of Tientsin, the following places have since been thrown open at various times:—

On the Canton or West River, Samshui, Wuchow, and Nanning.

On the Yangtse, Wuhu, Shasi, Ichang, Chungking, and Yochow—the last being at the entrance to the Tungting lake.

On the Shanghai inland waters the cities of Soochow and Hangchow were opened by the Japanese treaty of 1895. They are connected with Shanghai by canal.

On the Tongking and Burma frontiers, the cities of Lungchow, Mengtze, Szemao, and Momien.

The German naval station in Kiaochow Bay (Tsingtao) is also open to trade, and it is understood that Talienwan, which was similarly acquired on lease by Russia, and which is to be the commercial terminus of the Russian Manchurian Railway, will in due course also be thrown open. An anchorage termed Chingwan-tao, near Shanhai-kwan, in the Gulf of Pe Chili, was opened in 1900. It lies close to the Imperial Northern Railway, and being ice-clear during the winter affords access to Peking when the other northern ports are closed.

*Internal Communication—Railways.*—The ninth edition article on China closed with the notice of the opening of a short line of railway between Shanghai and Woosung, and the writer hazarded the remark, that notwithstanding the fact that the trains were daily crowded with passengers, the approbation was that of the people only, and that the Government were more determined than ever to withstand the adoption of the iron road (v. 672). The fate of this pioneer railway may be mentioned as an introduction to what follows. It must be admitted that the officials had some justification for their opposition. The railway was really built without any regular permission from the Chinese Government, but it was hoped that once finished and working, the irregularity would be overlooked in view of the manifest benefit to the people. This might have been accomplished but for an unfortunate accident which happened on the line a few months after it was opened. A Chinaman was run over and killed, and this event, of course, intensified the official opposition, and indeed threatened to bring about a riot. The working of the line was stopped by order of the British minister, and thereupon negotiations were entered into with a view to selling the line to the Chinese Government. A bargain was struck sufficiently favourable to the foreign promoters of the line, and it was further agreed that, pending payment of the instalments which were spread over a year, the line should continue to be worked by the company. The expectation was that when the officials once got the line into their own hands, and found it a paying concern, they would continue to run it in their own interest. Not so, however, did things fall out. The very day that the twelve months were up the line was closed; the engines were dismantled, the rails and sleepers were torn up, and the whole concern was shipped off to the distant island of Formosa, where carriages, axles, and all the rest of the gear were dumped on the shore and left for the most part to disappear in the mud. The spacious area of the Shanghai station was cleared of its buildings, and thereon was erected a temple to the queen of Heaven by way of purifying the sacred soil of China from such abomination. This effectually put a stop to all efforts on the part of foreigners to introduce railways into China, and more than twenty years elapsed before the subject was taken up again. It is only within quite recent years that the Chinese Government have been induced to move in the matter. The first short line built was a mineral line, to connect the coal mines of Kaiping in North Chihli with the mouth of the Peiho river at Taku. The Government next authorized the formation of a Native Merchants' Company, under official control, to build a line from Taku to Tientsin, which was opened to traffic in 1888. It was not, however, till nine years later, viz., in 1897, that the line was completed as far as Peking. Meantime, however, the extension had been continued north-east along the coast as far as Shanhai-kwan, and a further extension will connect with the treaty port of Newchwang. The money for these extensions was mostly found by the Government, and the whole line is now known as the Imperial Northern Railway. A loan of £2,300,000 for the Newchwang extension was raised through the Hongkong and Shanghai Bank in 1899, and secured by a mortgage on the completed section as far as Shanhai-kwan. The length of the line is 340 miles, and, including the Newchwang extension, it will be when completed 600 miles in length. Meanwhile the high officials of the empire had gradually been brought round to the idea that railway development was in itself a good thing. Chang Chih-tung, then viceroy of the Canton provinces, memorialized strongly in this sense, coupled, however, with the condition that the railways should be built with Chinese capital and of Chinese materials. In particular, he urged the making of a line to connect Peking with Hankow for strategic purposes. The Government took him at his word, and he was transferred from Canton to Hankow with authority to proceed forthwith with his railway. True to his purpose he at once set to work to construct iron-works at Hankow. Smelting furnaces, rolling mills, and all the machinery necessary for turning out steel rails, locomotives, &c., were erected. Several years were wasted over this preliminary work, and over £1,000,000 sterling was spent only to find that the works after all were a practical failure. Steel rails could be made, but at a cost two or three times what they could be procured for in Europe. After the Japanese war the hope of building railways with Chinese capital was abandoned. A prominent official named Sheng Hsuan-hwai was appointed director-general of railways, and empowered to enter into negotiations with foreign financiers for the purpose of raising loans. It was still hoped that at least the main control would remain in Chinese hands, but the diplomatic pressure of France and Russia caused even that to be given up, and Great Britain insisting on equal privileges for her subjects, the future of railways in China will be in the hands of the various concessionaires, at least until their redemption by the Chinese Government.

The following is a list of the several railway concessions which have been granted up to date:—

(1) *English.*—1. (*a*) Shanghai to Nanking; (*b*) Shanghai to

Hangchow and Ningpo; (*c*) Pukou (on the north bank of the Yangtse opposite Nanking) to Siuyang, a station on the Luhan line. Total length 650 miles. 2. Hongkong to Canton, 100 miles. 3. In the provinces of Shansi and Honan, the Peking Syndicate, besides mining rights, have the right to connect mines with navigable waters. Lines not yet determined, but will probably extend to 300 or 400 miles.

(2) *Anglo-German.*—A trunk line from Tientsin to Chinkiang, 600 miles. Northern or Shantung half to be built and equipped by the German syndicate; the southern or Yangtse half by English syndicate. Total length 600 miles.

(3) *Anglo-American.*—A trunk line from Canton to Hankow, 600 miles.

(4) *German.*—Lines in Shantung. Kiaochow to Tsinanfu, and Kiaochow to Yihsien, 420 miles.

(5) *Russian.*—(*a*) Permission to carry the Siberian main line now in course of construction from Stretensk through Chinese territory *viâ* Petune to Vladivostock, 1000 miles. (*b*) A line to connect Port Arthur and Talienwan with the above, 400 miles. (*c*) A line from Taiyuenfu, the capital of the province of Shansi, to connect with the Luhan line at Chengting, 130 miles.

(6) *Belgian* or *Franco-Belgian.*—A trunk line from Hankow to Peking, generally termed the Lu-Han line, length 700 miles.

(7) *French.*—(*a*) From Tongking up the Red river to Yunnanfu, 200 miles. (*b*) Langson to Lungchow and Nanning, 100 miles. (*c*) Pakhoi to Nanning, 120 miles.

The British Government has also obtained the right to extend the Burma railway system through Yunnan and north to the Yangtse so soon as a company is prepared to take it up.

Many years will doubtless elapse before these lines are made, involving as they do an outlay of something like 60 or 80 millions of capital, and some of them will probably not be made at all. The Russian lines are being pushed on with activity, and the Belgian, or more properly Franco-Belgian syndicate, which has the Peking-Hankow, commonly called the Lu-Han line in hand, has commenced work from the Hankow end. The section Peking to Paotingfu has been already built, and has been transferred for operation to the Belgian syndicate. The lower Yangtse lines as well as the Hongkong-Canton line will no doubt be made, and passing as they do through the richest and most populous districts of China, they ought to pay well.

*Roads and Canals.*—In regard to these nothing new need be said. The Chinese Government spends nothing on these objects. Occasionally the local authorities make an effort by employing the corvée system to dig out the bed of a canal, but as a rule roads are left to take care of themselves. Even the Grand Canal has been suffered to silt up, so that for nearly half its length it is quite useless for through traffic. It is only employed by the annual fleet of tribute rice boats, which are still required by unyielding regulations to carry their freight by this route. They choose the time of high water, when the country is more or less flooded, and even then it is only by dint of sheer hauling for miles along a muddy bottom that they are got through. Pages are filled by the reports of the officer in charge, describing the superhuman exertions of himself and his men in getting the boats hauled through. It does not appear to occur to anyone that a moderate sum spent in dredging, with a few locks here and there, would make the passage cheap and easy.

*Telegraphs.*—Here the case is different. Every important city in China is now connected by wire with the capital, and the service is reasonably efficient. Connexion is also established with the English lines in Burma and the Russian lines in Siberia. The Great Northern Telegraph Co. (Danish) and the Eastern Extension Telegraph Co. (English) connect Shanghai by cable with Hongkong, Japan, Singapore, and Europe. An imperial *postal service* has also been recently established under the general control of the Maritime Customs. It serves all the open ports, and is gradually being extended to the interior. The treaty Powers, however, still maintain their separate post offices at Shanghai for the despatch and receipt of mails from Europe.

*Mining Concessions.*—The only mining concession of any value granted to a foreign company is that secured by the Peking Syndicate, which gives the right to work coal, iron, and petroleum in the province of Shansi. It is expected that this concession will lead to very important industrial developments. Several preliminary contracts have been entered into for mining concessions in other provinces, but they are clogged with conditions imposed by recent regulations issued by the Chinese Government, and for the present they seem of doubtful value.

*Banks and Banking.*—Native banks for purposes of inland exchange are to be found in most large cities. They are private banks using their own capital, and seldom receiving deposits from the public. The best known are the Shansi banks, which have branches all over the empire. They work on a small capital, seldom over £50,000 each, and do a small but profitable business by selling their drafts on distant places. None of these issue notes, although they are not debarred from doing so by law. They lend money on personal security, but do not advance against shipments of goods. In some places there are small local banks, usually called cash shops, which issue paper notes for small sums and lend money out on personal security. The notes never reach more than a very limited local circulation, and pass current merely on the credit of the institution. There is no law regulating the formation of banks or the issue of notes. *Pawnshops* occupy a prominent position in the internal economy of China. They lend on deposit of personalty at very high rates, 18 and 24 per cent., and they receive deposits of money from the public, usually allowing 6 to 10 per cent. They are the real banks of deposit of the country, and the better class enjoy good credit.

*Currency.*—The currency of China consists of:—(1) *Silver*, which may be either uncoined ingots passing current by weight, or imported coins, Mexican dollars and British dollars; and (2) *Copper* "cash," which has no fixed relation to silver. The standard is silver, the unit being the Chinese ounce or tael, containing 565 grains. The tael is not a coin, but a weight. Its value in sterling consequently fluctuates with the value of silver; in 1870 it was worth about 6s. 8d., it is now worth rather less than 3s. The name given in China to uncoined silver in current use is "sycee." It is cast for convenience sake into ingots weighing about 50 taels each. Its average fineness is 916·66 per 1000. When foreign silver is imported, say into Shanghai, it can be converted into currency by a very simple process. The bars of silver are sent to a quasi-public office termed the "Kung Ku," or public valuers, and by them melted down and cast into ingots of the customary size. The fineness is estimated, and the premium or betterness, together with the exact weight, is marked in ink on each ingot. The whole process only occupies a few hours, and the silver is then ready to be put into use. The Kung Ku is simply a local office appointed by the bankers of the place, and the weight and fineness are only good for that locality. The Government takes no responsibility in the matter, but leaves merchants and bankers to adjust the currency as they please. For purposes of taxation and payment of duties there is a standard or treasury tael, which is about 10 per cent. heavier than the tael of commerce in use at Shanghai. Every large commercial centre has its own customary tael, the weight and therefore the value of which differ from that of every other. Silver dollars coined in Mexico, and British dollars coined in Bombay, also circulate freely at the open ports of trade and for some distance inland, passing at a little above their intrinsic value. Carolus dollars, introduced long ago and no longer coined, are retained in current use in several parts of the interior, chiefly the tea-growing districts. Being preferred by the people, and as the supply cannot be added to, they have reached a considerable premium above their intrinsic value. Provincial mints in Canton, Wuchang, and other places, have recently been issuing silver coins of the same weight and touch as the Mexican dollar, but very few have gone into use. As they possess no privilege in debt-paying power over imported Mexican dollars there is no inducement for the people to take them up unless they can be had at a cheaper rate than the latter, and these are laid down at so small a cost above the intrinsic value that no profit is left to the mint. The coinage has in consequence been almost discontinued. Subsidiary coins, however, are coming largely into use, issued by the local mints. The only coin officially issued by the Government is the so-called *copper cash*. It is a small coin which by regulation should weigh $\frac{1}{10}$th of a tael, and should contain 50 parts of copper, 40 of zinc, and 10 of lead or tin, and it should bear a fixed ratio to silver of 1000 cash to one tael of silver. In practice none of these conditions are observed. Being issued from a number of mints, mostly provincial, the standard was never uniform, and in many cases debased. Excessive issues lowered the value of the coins, and for many years the average exchange was 1600 or more per tael. Within the last few years the rise in copper has led to the melting down of all the older and superior coins, and as for the same reason coining was suspended, the result has been an appreciation of the "cash," so that a tael now exchanges for only 1180 or 1200. Inasmuch as the "cash" bears no fixed relation to silver, and is moreover of no uniform composition, it forms a sort of mongrel standard of its own, varying with the volume in circulation at any particular time. It is, however, the universal medium of exchange for all retail transactions, and the quantities in circulation are enormous. The fluctuations in regard to silver give rise to great complaints among the people. The introduction of a uniform system of coinage is one of the most pressing wants of China.

## II. Recent History.

In the article in the ninth edition of the *Encyclopædia Britannica*, the history of China was carried down to the accession of the Emperor Kwang Su in January 1875. As an introduction to what

follows we shall first take a brief survey of the condition of the empire at that period. The decade 1854-64 had witnessed low-water mark in the political fortunes of the Manchu dynasty. The central provinces had been overrun and devastated by the Taiping rebels. Nanking, the ancient capital of the empire, was in their hands, and throughout the whole of the lower Yangtse valley, even down to Shanghai and Ningpo, bands of marauders burnt, pillaged, and murdered at their will. In the south-west the province of Yunnan was the scene of another rebellion. A Mahommedan tribe known as Panthays had risen in revolt, captured the city of Talifu, and proclaimed a chief Tu Win Siu as their sultan. In the north-west a similar Mahommedan rebellion broke out in the province of Kansuh. This was followed by a revolt of the whole of the central Asian tribes, which for 2000 years had more or less acknowledged the imperial sway. In Kashgaria, a native chief termed Yakoob Beg, otherwise known as the Atilik Ghazi, had made himself Ameer, and seemed likely to establish a strong rule. The fertile province of Kuldja or Ili, lying to the north of the Tien shan range, was temporarily taken possession of by Russia in order to put a stop to the prevailing anarchy, but with a promise that when China should have succeeded in re-establishing order in her central Asian dominions it should be given back. To add to all these misfortunes, and even when they were at their height, the Chinese Government embroiled itself in a foreign war. Redress being refused for long-standing grievances, a combined British and French expedition was sent to operate in the north. The emperor fled to Mongolia, Peking was surrendered, and terms of peace were dictated within the walls of the capital (24th October 1860). This last calamity, which might have seemed to some the worst of all, was in reality the salvation of the country. The foreign Powers had gone there for the sole purpose of establishing fair and equitable terms of trade—terms which would be just as advantageous to the people of China as to themselves. The treaty having once been made with the imperial Government, it was their interest to uphold its authority, and to see a speedy end to the forces of anarchy and disorder. No sooner, therefore, had the war with China been finished, than Great Britain and France proceeded to lend the Chinese active assistance. The services of General Gordon at this juncture are too well known to need further mention. With the first of his victories the tide began to turn, and from that time fortune smiled on the imperial arms. By degrees the Taiping rebellion was crushed; indeed the movement had for some years been collapsing through internal decay; and, with the fall of Nanking in 1864, it finally disappeared. The next ten years (1864-74) witnessed a general revival of the strength of the empire. The Panthay rebellion in Yunnan was put down in 1873, and order had been re-established somewhat earlier in the north-western provinces of Shensi and Kansuh. The central Asian states still remained under the rule of the Ameer Yakoob Khan, and China was at this time strongly counselled by many to leave things alone in that region. Russia had in the course of the disorder possessed herself of the khanate of Khokand, and it was pointed out that a strong state like that of Kashgaria under Yakoob Khan might be a convenient buffer against farther progress on that side from the great western Power. This counsel, however, as will be seen, did not prevail.

Such, briefly, was the state of affairs at the accession of the reigning emperor, Kwang Su, in January 1875. He was not then four years old, and his accession attracted little notice outside of China, as the supreme power continued to be vested in the two dowager empresses whose long regency had been only nominally determined in favour of the emperor Tung Chi when the latter attained his majority in 1873—the empress Tsu An, principal wife of the emperor Hsien Fung, and the empress Tsu Tsi, secondary wife of the same emperor, and mother of the emperor Tung Chi. Yet there were circumstances connected with the emperor Kwang Su's accession which might well have arrested attention. The emperor Tung Chi, who had himself succumbed to an ominously brief and mysterious illness, left a young widow in an advanced state of pregnancy, and had she given birth to a male child her son would have been the rightful heir to the throne. But even before she sickened and died—of grief, it was officially stated, at the loss of her imperial spouse—the dowager empresses had solved the question of the succession by placing Kwang Su on the throne, a measure which was not only in itself arbitrary, but also in direct conflict with one of the most sacred of Chinese traditions. The solemn rites of ancestor-worship, incumbent on every Chinaman, and, above all, upon the emperor, can only be properly performed by a member of a younger generation than those whom it is his duty to honour. The emperor Kwang Su, being a son of Prince Chun, brother to the emperor Hsien Fung, and thus first cousin to the emperor Tung Chi, was not therefore qualified to offer up the customary sacrifices before the ancestral tablets of his predecessor. So profound was the prejudice created against the young emperor on this score, that fifteen years later, when, having reached the age of manhood, he proceeded for the first time to the Temple of Heaven to perform the ancestral rites, one of the censors committed suicide in his presence as a protest against so grave a breach of the dynastic tradition. The accession of an infant in the place of Tung Chi achieved, however, for the time being what was doubtless the paramount object of the policy of the two empresses, namely, their undisturbed tenure of the regency, in which the junior empress Tsu Tsi, a woman of unquestionable ability and boundless ambition, had gradually become the predominant partner.

***Murder of Mr Margary.***

The first question that occupied the attention of the Government under the new reign was one of the gravest importance, and nearly led to a war with Great Britain. The Indian Government was desirous of seeing the old trade relations between Burma and the south-west provinces, which had been interrupted by the Yunnan rebellion, re-established, and for that purpose proposed to send a mission across the frontier into China. The Peking Government assented and issued passports for the party. Mr A. R. Margary, a young and promising member of the China consular service, was told off to accompany the expedition as interpreter. All went well until the mission, which was under the command of Colonel Browne, was nearing the Chinese frontier, when rumours of trouble ahead began to reach them. Mr Margary, who had a month previously crossed overland from Shanghai with no difficulty, made light of the reports, but offered to ride on ahead and ascertain the state of affairs. He left, accompanied only by his Chinese servants, and never returned. Two days afterwards news reached Colonel Browne that he had been treacherously murdered by Chinese at the small town of Manwyne, and almost simultaneously an attack was made on the expedition by armed forces wearing Chinese uniform (January 1875). Colonel Browne with difficulty made his way back to Bhamo and the expedition was abandoned. Demands were made on the Peking Government for a thorough inquiry on the spot in the presence of British officers. The Chinese reply was that the murder and the attack were alike the work of irresponsible savages and hillmen, animated with a desire for plunder. Enough evidence was collected on the Burma side to show that this was not true, and it could not be doubted that the orders for the attack emanated from the provincial government of Yunnan, if not from higher quarters. After infinite shuffling and delay an imperial commission was despatched to hold an inquiry, three British officers being sent at the same time to watch proceedings. The trial proved an absolute farce. Eleven half-naked savages were produced as the culprits, and the only evidence tendered was such as had manifestly been manufactured for the purpose. The British officials protested and withdrew from the burlesque. The trial, however, proceeded, and the eleven hillmen were sentenced to death. A report in that sense was addressed to the throne, and with this it was hoped the British sense of justice would be satisfied. Sir Thomas Wade, then British minister at Peking, promptly declared that if this report were published or acted on he would at once haul down his flag, rightly deeming that such a reparation was a greater insult than the original offence. Tedious negotiations followed, which more than once threatened to end in a rupture, but finally, more than eighteen months after the outrage, an arrangement was come to on the basis of guarantees for the future, rather than vengeance for the past. The arrangement was embodied in the Chefoo convention, dated 13th September 1876. The terms of the settlement comprised (1) a mission of apology from China to the British court; (2) the promulgation throughout the length and breadth of the empire of an imperial proclamation, setting out the right of foreigners to travel under passport, and the obligation of the authorities to protect them; and (3) the payment of an indemnity. The convention comprised besides a number of clauses which, though meant to improve commercial relations, were severely criticized by the mercantile communities. The stipulation most objected to was one by which the Chinese Government were debarred from levying likin within the area of the foreign concessions, thereby implying, it was argued, the recognition of the right to levy it *ad libitum* elsewhere. Ratification of this article was refused by the British Government, and additional articles were subsequently signed in London relative to the collection of likin on Indian opium and other matters.

While these events were going on the imperial authority had been re-established in the north-western provinces of Shensi and Kansuh under Tso Tsung-tang as governor-general, and preparations were made for the reconquest of Kashgaria. Money was supplied by a foreign loan for £1,600,000, being the first appearance of China as a borrower. It was a formidable expedition; not so much from the warlike nature of the enemy, as from the immense distances to be traversed and the extreme difficulty of transport. Nevertheless after two years of dogged perseverance China succeeded. Manas, the last stronghold of the Jungaris, was captured (November 1876), and the death of the Ameer Yakoob Khan in the following year greatly facilitated the com-

pletion of the task. By degrees the emperor's authority was established from the confines of Kansuh to Kashgar and Yarkand, and Chinese garrisons were stationed in touch with the Russian outposts in the region of the Pamirs (December 1877). There remained only the north-eastern province of Kuldja, occupied by Russia, but under a promise made in 1871 to restore it when China was in a position to maintain order. This promise Russia was now called upon to redeem. It is probable that, in making this promise, Russia calculated that the day was far distant when China would be in a position to fulfil the condition; at all events she showed no desire to comply with the request. China despatched Chung-how, a Manchu of the highest rank, who had been notoriously concerned in the Tientsin massacre of 1871, to St Petersburg to negotiate a settlement. After some months of discussion a document was signed (September 1879), termed the treaty of Livadia, whereby China recovered, not indeed the whole, but a considerable portion of the disputed territory, on her paying to Russia five million roubles as the cost of occupation. At first sight it was considered by Western diplomatists that, having regard to the small amount of pressure he could bring to bear, Chung-how had acquitted himself of his mission rather well. The treaty was, however, received with a storm of indignation in China. Li Hung-Chang and Tso Tsung-tang took up the cry. Chung-how was placed under arrest as soon as he returned. Memorials poured in from all sides denouncing the treaty and its author. Foremost among these was one by Chang Chih-tung, then occupying a subordinate post in the Hanlin, who has since become the most distinguished of the viceroys, and is actually governor-general of Hupeh and Hunan. Its publication raised him at once into eminence. He demonstrated *seriatim* the objections to the treaty, chief of which was that, under guise of trading facilities, it opened a way for the military aggression of Russia from the west, and he wound up with declaring, "If we do not alter this treaty we are not worthy to be called a nation." Prince Chun, the emperor's father, came into prominence at this juncture as an advocate for war, and under these combined influences the unfortunate Chung-how was tried and condemned to death (3rd March 1880). For some months warlike preparations went on, and the outbreak of hostilities was imminent. In the end calmer counsels prevailed; the foreign ministers interceded for Chung-how, and he was first reprieved and finally released. Li Hung-Chang, though he had been one of the first to raise the storm, became alarmed at the near prospect of war, for which he well knew China was unprepared, and threw in his voice with Prince Kung on the side of peace. A visit from General Gordon, and the sound, though probably unpalatable, advice which he gave, weighed in the same direction. It was decided to send the Marquis Tseng, who in the meantime had become minister in London, to Russia to negotiate a new treaty. With more adroitness he avoided his predecessor's mistakes, and produced a treaty which, though not very materially different from the old, inasmuch as it still left Russia in possession of part of the Ili valley, pleased everybody, and was universally accepted. This was ratified 19th August 1881. The Chinese Government could now contemplate with satisfaction the complete recovery of the whole extensive dominions which had at any time owned the imperial sway. The regions directly administered by the officers of the emperor extended from the borders of Siberia on the north to Annam and Burma on the south, and from the Pacific Ocean on the east to Kashgar and Yarkand on the west. But even that did not complete the tale, for outside these boundaries there was a fringe of tributary nations which still kept up the ancient forms of allegiance, and which more or less acknowledged the dominion of the central kingdom. As most of China's subsequent misfortunes have been in connexion with one or other of these tributary states, a brief notice may here be permitted of the actual relationship subsisting at this date. The principal tributary nations then were Korea, Liuchiu, Annam, Burma, and Nepaul. The dynastic records enumerate several others, including even England, Lord Macartney's mission of 1793 having been gravely described as bringing tribute, but these were more or less accidental. The tie which bound these states to their suzerain was of the loosest description. China accepted their homage with calm superiority, but conceived herself to be under no reciprocal obligation. It was usual for the kings, on succession, to seek investiture, which consisted in the grant of a patent and a seal, but even that was not invariably insisted on. In any case, it was no part of the duty of China to keep the king on his throne. If his subjects chose to depose him and set up another, they might do so, and she received a successful usurper and bestowed a new patent and a new seal with the same nonchalance as she had manifested to his predecessor. This happened more than once in Annam.

**Imperial consolidation.**

Such was the attitude which China still maintained when foreign nations first began to come into contact with these tributary states. She did not recognize that the position of suzerain involved responsibilities as well as rights, and to this non-perception are to be attributed all the vagaries of her diplomacy and the complications in which she became involved. Korea was the first of the dependencies to come into notice. In 1866 some Roman Catholic missionaries were murdered, and about the same time an American vessel was burnt in one of the rivers and her crew murdered. China refused satisfaction, both to France and America, and suffered reprisals to be made on Korea without protest. America and Japan both desired to conclude commercial treaties for the opening up of Korea, and proposed to negotiate with China. China refused and referred them to the Korean Government direct, saying she was not wont to interfere in the affairs of her vassal states. As a result Japan concluded a treaty in 1876, in which the independence of Korea was expressly recognized. This was allowed to pass without protest, but as other nations proceeded to conclude treaties on the same terms China began to perceive her mistake, and endeavoured to tack on to each a declaration by the king that he was in fact a tributary—a declaration, however, which was quietly ignored. Japan, however, was the only Power with which controversy immediately arose. In 1882 a faction fight, which had long been smouldering, broke out, headed by the king's father, the Tai Won Kun, in the course of which the Japanese legation was attacked and the whole Japanese colony had to flee for their lives. China sent troops, and by adroitly kidnapping the Tai Won Kun, order was for a time restored. The Japanese legation was replaced, but under the protection of a strong body of Japanese troops. Further revolutions and riots followed, in which the troops of the two countries took sides, and there was imminent danger of war. To obviate this risk, it was agreed in 1885 between Count Ito and Li Hung-Chang that both sides should withdraw their troops, the king being advised to engage officers of a third state to put his army on such a footing as would maintain order, and each undertook to give the other notice, should it be found necessary to send troops again. In this way a *modus vivendi* was established which lasted till the events which preceded the outbreak of war in 1894. Chinese influence continued predominant, but the unhappy kingdom was constantly disturbed by faction.

**Korea and Japan.**

We can only glance briefly at the domestic affairs of China during the period 1875-82. The years 1877-78 were marked by a famine in Shansi and Shantung, which for duration and intensity has probably never been equalled. For two successive seasons the crops failed. The population affected numbered 30 to 40 millions, the districts lay far from the coast, there was no water communication, and the roads were unfit for wheeled vehicles. Transport broke down, pack animals were not to be had, and sheer starvation stared the unfortunate people in the face. It was computed that 12 or 13 millions perished. It was hoped that this lamentable loss of life, due mainly to defective communications, would induce the Chinese Government to listen to proposals for railway construction, but even this argument had no effect. The fate of the experimental line at Shanghai has been already mentioned. The Russian scare had, however, taught the Chinese the value of telegraphs, and in 1881 the first line was laid from Tientsin to Shanghai. Further construction was continued without intermission from this date. A beginning also was made in naval affairs. The arsenal at Foochow was turning out small composite gunboats, a training ship was bought and put under the command of a British officer. Several armoured cruisers were ordered from Armstrong, and some progress was made with the fortifications of Port Arthur and Wei-hai-wei. Forts were also built and guns mounted at Foochow, Shanghai, Canton, and other vulnerable points. Money for these purposes was abundantly supplied by the customs duties on foreign trade, and China had learnt that at need she could borrow from the foreign banks on the security of this revenue. In all the elements of material strength she had grown enormously within the previous ten years, and her prestige had grown even more, for she was believed to be very much stronger than she really was.

In 1881 the senior regent, the empress Tsu An, was carried off by a sudden attack of heart disease, and the empress Tsu Tsi remained in undivided possession of the supreme power during the remainder of the emperor Kwang Su's minority. Li Hung-Chang, firmly established at Tientsin, within easy reach of the capital, as viceroy of the home province of Chihli and superintendent of northern trade, enjoyed a larger share of his imperial mistress's favour than is often granted by the ruling Manchus to officials of Chinese birth, and in all the graver questions of foreign policy his advice was generally decisive.

While the disputes with Japan were still going on regarding Korea, China found herself involved in a more serious quarrel in respect of another tributary state which lay on the southern frontier. By a treaty made between France and Annam in 1874, the Red river or Songkoi which, rising in south-western China, flows through the province of Tongking, was opened to trade together with the cities

**Tongking and Hanoi.**

of Haiphong and Hanoi situated on the delta. The object of the French was then, as it is now, to find a trade route to Yunnan and Szechuen from a base of their own, and it was hoped the Red river would furnish such a route. Tongking at the time, however, was infested with bands of pirates and cut-throats, many of whom were Chinese rebels or ex-rebels who had been driven across the frontier by the suppression of the Yunnan and Taiping rebellions, conspicuous among them being an organization called the Black Flags. The Annamese Government undertook by the treaty to restore order, and France had promised help. Some years having passed without any improvement, France, which meanwhile had kept a small guard at Haiphong, sent reinforcements (1882), nominally to assist the Annamese troops in putting an end to disorder. The Annamese officials, however, declined to receive them as friends, opposed their progress, and the expedition took the form of a military occupation. China, meanwhile, began to take alarm at the near approach of a strong military power to her southern frontier. When the treaty of 1874, which gave France trading privileges, was communicated to her, she seems to have treated it with indifference as she treated the Japanese treaty with Korea, and neither in the one case nor in the other took any steps to see that the provisions were carried out. Now, however, she began to protest, claiming that Annam was a vassal state and under her protection. France took no notice of the protest, declaring that the claim had merely an archæological interest, and that, in any case, China in military affairs was a *quantité négligeable*. France found, however, that she had undertaken a very serious task in trying to put down the forces of disorder in Tongking. The Black Flags were, it was believed, being aided by money and arms from China, and as time went on, her troops were more and more being confronted with regular Chinese soldiers. Several forts, well within the Tongking frontier, were known to be garrisoned by Chinese troops. Operations continued with more or less success during the winter and spring of 1883-84. Both sides, however, were desirous of an arrangement, and in May 1884 a convention was signed between Li Hung-Chang and a Captain Fournier, who had been commissioned *ad hoc*, whereby China agreed to withdraw her garrisons and to open her frontiers to trade, France agreeing, on her part, to respect the fiction of Chinese suzerainty, and guarantee the frontier from attack by brigands. The arrangement was satisfactory to both sides, but, strange to say, it was completely frustrated by a series of unfortunate misunderstandings which led to a renewal of hostilities. No date had been fixed in the convention for the evacuation of the Chinese garrisons, and Fournier endeavoured to supplement this by a memorandum to Li Hung-Chang, at the same time announcing the fact to his Government. In pursuance of this arrangement the French troops proceeded to occupy Langson on the date fixed (21st June 1884). The Chinese commandant refused to evacuate, alleging, in a despatch which no one in the French camp was competent to translate, that he had received no orders, and begged for a short delay to enable him to communicate with his superiors. The French commandant ordered an attack, which was repulsed with severe loss. Mutual recriminations ensued, the French declaring the resistance an act of treachery, and the Chinese declaring that the French had broken faith by advancing before the date fixed. The whole question turned on the unfortunate memorandum of Captain Fournier. The Chinese alleged that in deference to Li Hung-Chang's representation, Captain Fournier had agreed to postpone the date of evacuation, and himself erased the original figures and inserted others, attesting the alteration by putting his initials in the margin; and they produced the original document so altered. Captain Fournier affirmed, on his honour, that he had made no alteration, and declared the whole thing an impudent forgery. On whichever side the truth lay, the result was greatly to embitter the feeling on both sides. From Paris there came a demand for a huge indemnity as reparation for the insult. The Peking Government offered to carry out the convention, and to pay a small indemnity for the lives lost through the misunderstanding. This was refused, and hostilities recommenced, or, as the French preferred to call them, reprisals, for the fiction was still kept up that the two countries were not at war. Under cover of this fiction the French fleet peaceably entered the harbour of Foochow, having passed the forts at the entrance to the river without hindrance. Once inside, they attacked and destroyed the much inferior Chinese fleet which was then quietly at anchor, destroying at the same time a large part of the arsenal which adjoins the anchorage (23rd Aug. 1884). Retracing its steps, the French fleet attacked and destroyed with impunity the forts which were built to guard the entrance to the Min river, and could offer no resistance to a force coming from the rear. After this exploit the French fleet left the mainland and continued its reprisals on the coast of Formosa. Keelung, a treaty port, was bombarded and taken, Oct. 4th. A similar attempt, however, on the neighbouring port of Tamsuy was unsuccessful, the landing party having been driven back to their ships with severe loss. The attempt was not renewed, and the fleet thereafter confined itself to a semi-blockade of the island, which was prolonged into 1885 but led to no practical results. Desultory operations were continued in the neighbourhood of Shanghai and Ningpo, two old vessels were taken and burnt, but the two or three really powerful boats which the Chinese then possessed took refuge behind the guns of Port Arthur, whither the French admiral did not care to follow them. By way of bringing pressure on the Chinese Government, the French at this time declared rice contraband of war, in order to stop the supplies going forward to the capital by sea. Even this, though raising an interesting point in international law, had no practical effect. Meanwhile the Chinese had been greatly emboldened by the successful defence of Tamsuy, and the failure of the French to push home such successes as they had gained. Preparations on a great scale were made to continue the war, and a rising tone was noticed, not only in the acts of the Government, but throughout the country. The new-born native press assiduously encouraged this feeling, and from this time forward began to count as a factor in the situation. Troops were massed on the frontier of Tongking, and the French forces which had pushed their way as far as the border were compelled by overwhelming masses of the enemy to fall back on their base in the delta of the river. Negotiations for peace, however, which had been for some time in progress through the mediation of Sir Robert Hart, were at this juncture happily concluded (April 1885), and the French cabinet was thereby relieved from a very embarrassing situation. The terms were practically those of the Fournier convention of the year before, the demand for an indemnity having been quietly dropped.

China, on the whole, came out of the struggle with greatly increased prestige. She had tried conclusions with a first-class European Power and had held her own. In material resources she had not been weakened. The provincial fleet at Foochow had indeed been destroyed, but it was of no serious value as a fighting force. On the other hand she had saved her three armoured cruisers, the value of the new fortress of Port Arthur as a naval base had been proved, and, most satisfactory of all, she was not crippled by the exaction of an indemnity. Morally she might claim a victory. Reasonings such as these, however, omitted to take note of the fact that France was never more than half-hearted over the war. No effective support was given to the French admiral from home, the number of troops sent to Tongking was inadequate to the task they were called on to perform, and no opportunity was afforded to see how Chinese soldiers would stand up against regular European troops. Incorrect conclusions as to the military strength of China were consequently drawn, not merely by the Chinese themselves—which was excusable—but by European and even British authorities, who ought to have been better informed. China was lulled into a false security which proved disastrous when the day of trial came. For the time, however, the lessons of the war were so far learned that the necessity for a strong fleet became generally recognized, and means were at once adopted to that end. War vessels were ordered both from England and Germany, and Admiral Lang, who had withdrawn his services while the war was going on, was re-engaged together with a number of British officers and instructors. The completion of the works at Port Arthur was taken in hand, and a beginning was made in the construction of forts at Wei-hai-wei as a second naval base. A new department was created for the control of naval affairs, at the head of which was placed Prince Chun, father of the Emperor, who since the downfall of Prince Kung in 1884 had been taking a more and more prominent part in public affairs. A tour made by Prince Chun in the spring of 1886, in the course of which he visited Port Arthur and Chefoo escorted by the fleet, attracted much attention, as being the first time that a prince so near the throne had emerged from palace seclusion and exchanged friendly visits with foreign admirals and other representatives.

**1885-1894.**

From 1885 to 1894 the political history of China does not call for extended notice. Two incidents, however, must be recorded, the first being the conclusion of a convention between Great Britain and China, in which the latter undertook to recognize British sovereignty in Burma, to delimit the frontier, and to promote overland trade intercourse between the two countries. Great Britain, on the other hand, consented to the continuance of the customary decennial tribute mission to be despatched by the "highest authority in Burma," the members, however, to be Burmese, and she also consented not to press a mission which the Indian Government were proposing to send to Tibet and to which China had agreed. The recognition of Chinese suzerainty implied in the sending a tribute mission was sharply criticized, but in point of fact it has never been acted on and is now forgotten. The other incident was the temporary occupation of Port Hamilton by the British fleet (May 1885). Rumours of Russian intrigues in Korea, coupled with recent proceedings in Afghanistan, made it appear desirable that Great Britain should have a naval base farther north than Hong-

kong. For this purpose a small group of islands at the southern point of the peninsula of Korea, forming the harbour known as Port Hamilton, were occupied. Objections, however, were raised by the Chinese Government to their continued occupation, and Great Britain expressed her willingness to withdraw on receiving sufficient guarantees against their cession to any other Power. A trilateral agreement was thereupon come to, by which Russia bound [illegible] to respect the integrity of Korean territory, and Great Britain thereupon agreed to evacuate Port Hamilton, which was carried out in February 1887. In 1890 occurred an event which, though seemingly insignificant in itself, marks a turning-point in Chinese history, viz., the resignation of Admiral Lang from the command of the Chinese fleet. One of the lessons which the Chinese Government seemed to have learned from the French war was the recognition of the value of a strong fleet. Money was not spared, and a really efficient squadron had been got together and put under the joint command of Admiral Ting and his British colleague Admiral Lang. By tact and judgment the latter had so far avoided directly raising the question of who was really chief. Order and discipline were well maintained, and both men and officers were steadily improving in the knowledge of their profession. During a temporary absence of Admiral Ting, however, the Chinese second in command claimed the right to take charge,—a claim which Admiral Lang naturally resented. The question was referred to Li Hung-Chang, who decided against Admiral Lang, whereupon the latter, feeling that his authority to maintain discipline was gone, threw up his commission. His resignation was accepted, and he left, never to return. From this point the fleet on which so much depended began to deteriorate. Superior officers again began to steal the men's pay, the ships were starved, shells filled with charcoal instead of powder were supplied, accounts were cooked, and all the corruption and malfeasance that were rampant in the army crept back into the navy. It is needless to point the moral. Chinese superciliousness, jealousy of foreigners, and contempt of foreign instruction, once more proved her ruin. What the dismissal of Admiral Lang cost her was soon to be proved in the fatal battle of the Yaloo. Meanwhile things had not been going well in other respects. Excessive taxation and misgovernment produced a general feeling of unrest which continued throughout 1889-90-91. Rumours of risings and rebellions were prevalent, promoted, it was said, by secret societies, chief of which was the "Ko lao hwei," or Old Brotherhood Society. Numerous arrests and executions took place, especially in the Yangtse valley. In 1891 there was a series of violent anti-foreign outbreaks in the same region. At Wusieh, two Englishmen were murdered, and at Wuhu, Ichang, and Kiukiang, attacks were made on the foreign settlements and serious damage was done. Many missionary establishments in the interior were destroyed. The origin of these outbreaks was the same old story. Placards were circulated accusing foreigners of kidnapping children and of murdering them in order to boil down their eyes, brains, etc., for medicine. Missionaries were charged with the grossest immorality, and with using religion as a cloak to the vilest offences. It was found that a society in Hunan, at the head of which was a notorious ex-official named Chou Han, had been flooding the country with incendiary literature of this class. Repeated efforts were made to secure the punishment of these instigators, but with indifferent success; the Chinese Government, though not exactly screening the offenders, took no energetic measures to put a stop to the calumnies. The anti-foreign agitation, however, gradually died out and things reverted to the normal condition. There appeared even a prospect of considerable railway development—the leading officials having at last come round to the opinion that railways might be beneficial at least for strategic purposes.

***War with Japan.***

We pass on to 1894, a year which was fraught with momentous consequences to China, inasmuch as it witnessed the outbreak of the Japanese war. It opened auspiciously, for in November was to be celebrated the 60th anniversary of the birth of the empress-dowager. It was resolved that it should be marked with unusual magnificence, and loyal contributions poured in from all parts. In the spring, however, the state of Korea began to attract attention. A series of chronic rebellions had baffled the authorities, and help from China was asked for. China responded and sent 2000 men under General Yeh, notifying Japan of the fact, as she was bound to do under the convention of 1885. Japan replied by sending troops also, nominally to guard her legation, which she had a right to do under the same convention. The rebellion was stamped out, and then China proposed that both sides should withdraw. Japan made a counter proposal that both should join in imposing such reforms on Korea as would prevent a recurrence of these internal dissensions. This, in turn, China refused, alleging once more that she was not wont to interfere with the domestic affairs of her vassals. Again Japan retorted, denying the alleged suzerainty, and intimating that whether China joined or not she proposed to prosecute her schemes of reform, and would keep her troops there until the necessary guarantees had been obtained for the security of her trade. At the same time categorical schemes of civil and military reform were laid before the Korean Government, and the Japanese force in Seoul was largely increased. By the beginning of July she had over 10,000 men there. The Chinese Government thereupon proceeded to send more troops to reinforce General Yeh, who was stationed at Asan, a short distance south of Seoul. Among other transports a British steamer, the *Kowshing*, was chartered and despatched with some 1200 troops. On the way, and when nearing the coast of Korea, the *Kowshing* met a Chinese man-of-war steaming back full speed to China with evident signs of disorder. As subsequently became known, this vessel, the *Chi-yuen*, had exchanged hostile shots a few hours previously with a Japanese man-of-war and got the worst of it. The *Kowshing* was presently accosted by a Japanese war vessel, the *Naniwa*, and was called upon to surrender. This the Chinese soldiery refused to permit, and the British officer in charge then proposed to take the troops back to China. This in turn the Japanese refused to allow, and after a warning the *Naniwa* opened fire on the doomed vessel. A scene of indescribable confusion followed. The vessel sank with her living freight, a few escaped by swimming to a neighbouring island, three of the British officers were picked up by Japanese boats, and all the rest perished. Formal declarations of war soon followed. The first battle was fought at Asan on the 27th July. The Japanese attack was repulsed, but the Chinese evacuated their position during the night and retreated northwards. A series of desultory skirmishes followed, but the only real stand the Chinese made was at Pingyang. The division under General Tso—the only capable and honest general in the Chinese army—offered a stubborn resistance till their leader was killed, when they turned and fled. The defeat became a rout, and left the road to China open to the victorious Japanese. Two days afterwards, on the 17th September, the naval engagement of Yaloo was fought. The Chinese fleet possessed two ironclads heavier than anything in the Japanese navy, but it was hopelessly out-manœuvred by the Japanese and lost heavily. Five vessels were sunk, burnt, or driven ashore. Night coming on, the Japanese drew off, and the remainder of the Chinese squadron was allowed to seek shelter in Port Arthur. They did not venture to put to sea again, and in the end were captured or destroyed in the harbour of Wei-hai-wei in February of the following year. On land the Japanese continued their progress, crossed the Yaloo river, and entered Chinese territory on 24th October. City after city fell into their hands, and Newchwang, a treaty port, was occupied on the 4th March. Meanwhile a second Japanese army had landed on the Liaotung peninsula, and captured the naval stronghold of Port Arthur on 22nd November. A third expedition was launched against Wei-hai-wei, where the Chinese fleet had now sought refuge. In spite of the inclemency of the winter, operations were vigorously pursued by land and sea, and on 12th February 1895 the fortress and fleet were surrendered. Admiral Ting and the general commanding committed suicide. Further resistance was hopeless, and negotiations were opened for peace. After two abortive missions, which the Japanese refused as being unprovided with sufficient powers, Li Hung-Chang was sent as plenipotentiary, and on 17th April 1895 the treaty of Shimonoseki was signed. The terms included the cession of Liaotung peninsula, then in actual occupation by the Japanese troops, the cession of the island of Formosa, an indemnity of H. taels 200,000,000 (about £30,000,000), and various commercial privileges.

***European intervention.***

The signature of this treaty brought the European Powers on the scene. It had been for some time the avowed ambition of Russia to obtain an ice-free port as an outlet to her Siberian possessions—an ambition which was considered by British statesmen as not unreasonable. It did not, therefore, at all suit her purposes to see the rising power of Japan seated along the Gulf of Liaotung, and by implication commanding the whole of the coast-line of Korea. Even before proceeding to Shimonoseki, Li Hung-Chang is believed to have received assurances from Russia that she would not allow any cession of territory in that region to become operative. At any rate, in the interval between the signature and the ratification of the treaty, invitations were addressed by Russia to the Great Powers to intervene with a view to its modification on the ground of the disturbance of the balance of power, and the menace to China which the occupation of Port Arthur by the Japanese would involve. France and Germany accepted the invitation, Great Britain declined. In the end the three Powers brought such pressure to bear on Japan that she gave up the whole of her continental acquisitions, retaining only the island of Formosa. The indemnity was on the other hand increased by H. taels 30,000,000. For the time the integrity of China seemed to be preserved, and Russia, France, and Germany could pose as her friends. Great Britain, who had taken no hand in the retrocession, was looked on with coldness, and China

even bore her a grudge because she had not at an early period stepped in and put a stop to the war. Li Hung-Chang, who had had his honours restored, was personally grateful to Russia for having extricated him from a very awkward position, and cherished the general grudge against England in an unusual degree, a state of mind of which Russia is believed to have taken full advantage during that statesman's sojourn at the Russian court as special representative of the Chinese emperor at the Tsar's coronation. Ample evidence was indeed soon forthcoming that Russia and France had not been quite disinterested in rescuing Chinese territory from the Japanese grasp, for each began to claim a reward as evidence of the imperial gratitude. Russia obtained the right to carry the Siberian railway, which, for the past four or five years, she had been pressing on with eagerness, across Chinese territory from Stretensk to Vladivostock, thus avoiding a long détour, besides giving a grasp on northern Manchuria. France obtained, by a convention dated 20th June 1895, a rectification of frontier in the Mekong valley and certain railway and mining rights in Kiangsi and Yunnan. Both Powers obtained concessions of land at Hankow for the purposes of a settlement. Russia was also said to have negotiated a secret treaty, frequently described as the "Cassini Convention," but more probably signed by Li Hung-Chang at Moscow, giving her the right in certain contingencies to Port Arthur, which was to be refortified with Russian assistance. And by way of further securing her hold, Russia guaranteed a 4 per cent. loan of £15,000,000 issued in Paris to enable China to pay off the first instalment of the Japanese indemnity.

***Mekong valley dispute.***

The convention between France and China of 20th June 1895 brought China into sharp conflict with Great Britain, and gave rise to important negotiations which must be briefly noticed. China, having by the Burma convention of 1886 agreed to recognize British sovereignty over Burma, her quondam feudatory, also agreed to a delimitation of boundaries at the proper time. Effect was given to this last stipulation by a subsequent convention concluded in London (1st March 1894), which traced the boundary line from the Shan states on the west as far as the Mekong river on the east. In the Mekong valley there were two semi-independent native territories over which suzerainty had been claimed in times gone by both by the kings of Ava and by the Chinese emperors. These territories were named Meng Lun and Kiang Hung—the latter lying partly on one side and partly on the other of the Mekong river, south of the point where it issues from Chinese territory. The boundary line was so drawn as to leave both these territories to China, but in consideration of the fact that Great Britain was surrendering to China territory over which she might claim sovereignty as successor to the kings of Ava, and in respect of which sovereign rights had in point of fact been recently exercised, it was stipulated that China should not alienate any portion of these territories to any other Power without the previous consent of Great Britain. The Power contemplated, though not named, was France, who by a treaty with Siam, concluded in 1893, had pushed the boundary of her Annamese possessions up to the left bank of the Mekong, and it was desired to interpose this particular territory as a sort of buffer, so as to avoid any conflict of French and British interests in this remote and difficult region. This object was frustrated by the convention between France and China of 1895. Yielding to French pressure, and regardless of the undertaking she had entered into with Great Britain, China so drew the boundary line as to cede to France that portion of the territory of Kiang Hung which lay on the left bank of the Mekong. Compensation was demanded from China for this breach of faith, and at the same time negotiations were entered into with France for the better determining of the interests of the two countries in Siam and the territories lying between Siam and the Chinese frontier. These resulted in a joint declaration by the Governments of France and Great Britain, dated 15th January 1896, by which it was agreed as regards boundary that the Mekong from the point of its confluence with the Nam Huok northwards as far as the Chinese frontier should be the dividing line between the possessions or spheres of influence of the two Powers. It was also agreed that any commercial privileges obtained by either Power in Yunnan or Szechuen should be open to the subjects of the other. The negotiations with China resulted in a further agreement, dated 4th February 1897, whereby considerable modifications in favour of Great Britain were made in the Burma boundary drawn by the 1894 convention. The net result of these various conventions is, that from the Gulf of Tongking westwards, as far as the Mekong, the French Annamese possessions are coterminous with the southern frontier of China, and from the Mekong as far as the confines of Assam the British Burmese possessions are coterminous with the south-western frontier. In the middle where the possessions meet, the Mekong, from the frontier of China down to the northern boundary of Siam, is the dividing line.

While Russia and France were profiting by what they were pleased to call the generosity of China, Germany alone had so far received no reward for her share in compelling the retrocession of Liaotung; but, in November 1897, she proceeded to help herself by seizing the Bay of Kiaochow in the province of Shantung. The act was done ostensibly in order to compel satisfaction for the murder of two German missionaries, which had been perpetrated a few weeks before, but it soon was found that she was determined to hold the place in any event. A cession was ultimately made by way of a lease for a term of ninety-nine years—Germany to have full territorial jurisdiction during the continuance of the lease, with liberty to erect fortifications, build docks, and exercise all the rights of sovereignty. In December the Russian fleet was sent to winter in Port Arthur, and though this was at first described as a temporary measure, its object was speedily disclosed by a request made, in January 1898, by the Russian ambassador in London that two British cruisers, then also anchored at Port Arthur, should be withdrawn "in order to avoid friction in the Russian sphere of influence." They left shortly afterwards, and their departure in the circumstances was regarded as a blow to Great Britain's prestige in the Far East. In March the Russian Government peremptorily demanded a lease of Port Arthur and the adjoining anchorage of Talienwan—a demand which China could not resist without foreign support. After an acrimonious correspondence with the Russian Government Great Britain acquiesced in the *fait accompli*. The Russian occupation of Port Arthur was immediately followed by a concession to build a line of railway from that point northwards to connect with the Siberian trunk line in north Manchuria. As a counterpoise to the growth of Russian influence in the north, Great Britain obtained a lease of Wei-hai-wei, and formally took possession of it on its evacuation by the Japanese troops in May 1898.

***Kiaochow, Port Arthur, Wei-hai-wei.***

After much hesitation the Chinese Government had at last resolved to permit the construction of railways with foreign capital. An influential official named Sheng Hsuan-hwai was appointed director-general of railways, and empowered to enter into negotiations with foreign capitalists for that purpose. A keen competition thereupon ensued between syndicates of different nationalities, and their claims being espoused by their various Governments an equally keen international rivalry was set up. Germany had insisted upon obtaining as part of the Kiaochow settlement certain preferential railway and mining rights in the province of Shantung. France had previously obtained a similar recognition for the southern provinces of Kwangsi and Yunnan, and Russia indicated clearly that she considered Manchuria as her particular field of exploitation. Great Britain, though intimating her preference for the "open door," policy, meaning equal opportunity for all, yet found herself compelled to fall in with the general movement towards what became known as the "spheres of influence" policy, and claimed the Yangtse valley as her particular sphere. This she did by the somewhat negative method of obtaining from the Chinese Government a declaration that no part of the Yangtse valley should be alienated to any foreign Power. A more formal recognition of the claim, as far as railway enterprise was concerned, was embodied in an agreement (28th April 1899) between Great Britain and Russia, and communicated to the Chinese Government, whereby the Russian Government agreed not to seek for any concessions within the Yangtse valley, including all the provinces bordering on the great river, together with Chekiang and Honan, the British Government entering into a similar undertaking in regard to the Chinese dominions north of the Great Wall. (A supplementary exchange of notes of the same date excepted from the scope of this agreement the Shan-hai-kwan-Newchwang extension which had already been conceded to the Hongkong and Shanghai Bank.) A similar promise of non-alienation in respect of the province of Fuhkien was made to the Japanese Government (April 1898), which thus earmarked that province as the Japanese sphere. As a general partition seemed thus to be in progress the Italian Government stepped in and applied for a lease of a coaling station at Sanmun, on the coast of Chekiang, together with a grant of railway and mining rights in that province. The manner in which the request was put forward gave offence to the Yamen, and a blunt refusal was returned. The incident gave rise to much feeling both in Peking and Rome. The Italian minister was recalled, but his successor fared no better. China, apprehending a repetition of the Kiaochow incident, sent orders to the local troops to resist a landing if such should be attempted on the part of the Italian men-of-war. No landing, however, was attempted, and though negotiations were continued the demand has not been further pressed.

***"Open door," and "spheres of influence."***

In 1899 Talienwan and Kiaochow were respectively thrown open by Russia and Germany to foreign trade, and, encouraged by these measures, the United States Government initiated in September of the same year a correspondence with the great

European Powers and Japan, with a view to securing their definite adhesion to the "open-door" policy. The British Government gave an unqualified approval to the American proposal, and the replies of the other Powers, though more guarded, were accepted at Washington as satisfactory. A further and more definite step towards securing the maintenance of the "open door" in China was the agreement concluded in October 1900 between the British and German Governments. The signatories, by the first two articles, agreed to endeavour to keep the ports on the rivers and littoral free and open to international trade and economic activity, and to uphold this rule for all Chinese territory as far as (*wo* in the German counterpart) they could exercise influence; not to use the existing complications to obtain territorial advantages in Chinese dominions, and to seek to maintain undiminished the territorial condition of the Chinese empire. By a third article they reserved their right to come to a preliminary understanding for the protection of their interests in China, should any other Power use those complications to obtain such territorial advantages under any form whatever. On the submission of the agreement under the fourth and last article to the Powers interested, Austria, France, Italy, and Japan accepted its principles without express reservation—Japan first requesting and obtaining assurances that she signed on the same footing as an original signatory. The United States accepted the first two articles, but expressed no opinion on the third. Russia construed the first as limited to ports actually open in regions where the two signatories exercise "their" influence, and favourably entertained it in that sense, ignoring the reference to other forms of economic activity. She fully accepted the second, and observed that in the contingency contemplated by the third, she would modify her attitude according to circumstances.

Meanwhile, negotiations carried on by the British minister at Peking during 1898 resulted in the grant of very important privileges to foreign commerce. The payment of the second instalment of the Japanese indemnity was becoming due, and it was much discussed how and on what terms China would be able to raise the amount. The Russian Government, as has been stated, had made China a loan of the sum required for the first portion of the indemnity, viz., £15,000,000, taking a charge on the customs revenue as security. The British Government was urged to make a like loan of £16,000,000 both as a matter of friendship to China and as a counterpoise to the Russian influence. An arrangement was come to accordingly, on very favourable terms financially to the Chinese, but at the last moment they drew back, being overawed, as they said, by the threatening attitude of Russia. Taking advantage of the position which this refusal gave him, the British minister obtained from the Tsung-Li-Yamen, besides the declaration as to the non-alienation of the Yangtse valley above mentioned, an undertaking to throw the whole of the inland waterways open to steam traffic. The Chinese Government at the same time undertook that the post of inspector-general of customs should always be held by an Englishman so long as the trade of Great Britain was greater than that of any other nation. Minor concessions were also made, such as the opening of new ports, but the opening of the waterways is by far the greatest advance that has been made since 1860. The privilege is hampered as yet by the obstruction of the likin service, but as the Chinese have applied for a general revision of the treaty tariffs it may be presumed that the occasion will be used to put the inland revenue tariff on a more satisfactory footing.

Of still greater importance are the railway and mining concessions granted during the same year (1898), a list of which has already been given above. The Chinese Government had been generally disposed to railway construction since the conclusion of the Japanese war, but hoped to be able to retain the control in their own hands. The masterful methods of Russia and Germany had obliged them to surrender this control so far as concerned Manchuria and Shantung, the lines in which were left to be financed and worked by the Powers interested. In the Yangtse valley, Sheng, the director-general of railways, had been negotiating with several competing syndicates, playing one off against the other to force better terms. One of these was a Franco-Belgian syndicate, which was endeavouring to obtain the trunk line from Hankow to Peking. A British company was tendering for the same work, and as the line lay mainly within the British sphere it was considered not unreasonable to expect it should be given to the latter. At a critical moment, however, the French and Russian ministers intervened, and practically forced the Yamen to grant a contract in favour of the Franco-Belgian company. The Yamen had only a few days before explicitly promised the British minister that the contract should not be ratified without his having an opportunity of seeing it. As a penalty for this breach of faith, and as a set-off to the Franco-Belgian line, the British minister required the immediate grant of all the railway concessions for which British syndicates were then negotiating, and on terms not inferior to those granted to the Belgian line. In this way all the lines in the lower Yangtse, as also the Shansi Mining Companies' lines, were secured. A contract for a trunk line from Canton to Hankow was negotiated in the latter part of the same year (1898) by an American company, which completed the list for the time being. It would have been more satisfactory if these various concessions, instead of being wrung out of the weakness of China by the rivalry of foreign Powers, had been freely granted in the confidence of strength.

***The reform movement.***

There can indeed be little doubt that the Powers, engrossed in the diplomatic conflicts of which Peking was the centre, had entirely underrated the reactionary forces gradually mustering for a final struggle against the aggressive spirit of Western civilization. The lamentable consequences of administrative corruption and incompetence, and the superiority of foreign methods which had been amply illustrated by the Japanese war, had at first produced a considerable impression, not only upon the more enlightened commercial classes, but even upon many of the younger members of the official classes in China. The dowager-empress, who, in spite of the emperor Kwang Su having nominally attained his majority, had retained practical control of the supreme power until the conflict with Japan, had been held, not unjustly, to blame for the disasters of the war, and even before its conclusion the young emperor was adjured by some of the most responsible among his own subjects to shake himself free from the baneful restraint of "petticoat government," and himself take the helm. In the following years a Reform Movement, undoubtedly genuine, though opinions differ as to the value of the popular support which it claimed, spread throughout the central and southern provinces of the empire. One of the most significant symptoms was the relatively large demand which suddenly arose for the translations of foreign works and similar publications in the Chinese language which philanthropic societies, such as that "for the Diffusion of Christian and General Knowledge amongst the Chinese," had been trying for some time past to popularize, though hitherto with scant success. Chinese newspapers published in the treaty ports spread the ferment of new ideas far into the interior. Fifteen hundred young men of good family applied to enter the foreign university at Peking, and in some of the provincial towns the Chinese themselves subscribed towards the opening of foreign schools. Reform societies, which not infrequently enjoyed official countenance, sprang up in many of the large towns, and found numerous adherents amongst the younger *literati*. Early in 1898 the emperor, who had gradually emancipated himself from the dowager-empress's control, summoned several of the reform leaders to Peking, and requested their advice with regard to the progressive measures which should be introduced into the government of the empire. Chief amongst these reformers was Kang Yu-wei, a Cantonese, whose scholarly attainments, combined with novel teachings, earned for him from his followers the title of the "Modern Sage." Of his more or less active sympathizers who had subsequently to suffer with him in the cause of reform, the most prominent were Chang Yin-huan, a member of the Grand Council and of the Tsung-Li-Yamen, who had represented his sovereign at Queen Victoria's jubilee in 1897; Chen Pao-chen, governor of Hu-nan; Liang Chi-chao, the editor of the reformers' organ, *Chinese Progress*; Su Chi-ching, a reader of the Hanlin College, the educational stronghold of Chinese conservatism; and his son Su In-chi, also a Hanlin man and provincial chancellor of public instruction in Hu-nan.

***The reform edicts.***

It soon became evident that there was no more enthusiastic advocate of the new ideas than the emperor himself. Within a few months the vermilion pencil gave the imperial sanction to a succession of edicts which, had they been carried into effect, would have amounted to a revolution as far-reaching as that which had transformed Japan thirty years previously. The fossilized system of examinations for the public service was to be altogether superseded by a new schedule based on foreign learning, for the better promotion of which a number of temples were to be converted into schools for Western education; a state department was to be created for the translation and dissemination of the standard works of Western literature and science; even the scions of the ruling Manchu race were to be compelled to study foreign languages and travel abroad; and last, but not least, all useless offices both in Peking and in the provinces were to be abolished. A further edict was even reported to be in contemplation, doing away with the *queue* or pigtail, which, originally imposed upon the Chinese by their Manchu conquerors as a badge of subjection, had gradually become the most characteristic and most cherished feature of the national dress. Had China possessed a governing class imbued with similar enlightened patriotism to that which induced the Japanese daimios in 1869 to sacrifice their feudal rights in the interests of national regeneration, even the crude series of imperial edicts drawn up by Kang Yu-wei might have proved the starting-point of a new era. But the bureaucracy of China, which had battened for centuries on corruption and ignorance, had no taste for self-sacrifice.

Other vested interests felt themselves equally threatened. The priests, whose temples were to be alienated; the military mandarins, who were led to believe that the army was going to be handed over to foreign instructors; and, above all, the imperial clansmen and bannermen, the eunuchs, and other hangers-on of the palace, whose existence was bound up with all the worst traditions of Oriental misgovernment, were all equally alarmed, and behind them stood the whole latent force of popular superstition and unreasoning conservatism.

***The coup d'état.***

The dowager-empress saw her opportunity. The Summer Palace, to which she had retired, had been for some time the centre of resistance to the new movement, and in the middle of September 1898 a report became current that, in order to put an end to the obstruction which hampered his reform policy, the emperor intended to seize the person of the dowager-empress and have her deported into the interior. Some colour was given to this report by an official announcement that the emperor would hold a review of the foreign-drilled troops at Tientsin, and had summoned Yuan Shih-kai, their general, to Peking in order to confer with him on the necessary arrangements. But the reformers had neglected to secure the goodwill of the army, which was still entirely in the hands of the reactionaries. During the night of the 20th of September the palace of the emperor was occupied by the soldiers, and on the following day Kwang Su, who was henceforth virtually a prisoner in the hands of the empress, was made to issue an edict restoring her regency. Kang Yu-wei, warned at the last moment by an urgent message from the emperor, succeeded in escaping, but many of the most prominent reformers were arrested, and six of them were promptly executed. The *Peking Gazette* announced a few days later that the emperor himself was dangerously ill, and his life might well have been despaired of had not the British minister represented in very emphatic terms the serious consequences which might ensue if anything happened to him. Drastic measures were, however, adopted to stamp out the reform movement in the provinces as well as in the capital. The reform edicts were cancelled, the reformers' associations were dissolved, their newspapers suppressed, and those who did not care to save themselves by a hasty recantation of their errors were imprisoned, proscribed, or exiled. In October the reaction had already been accompanied by such a recrudescence of anti-foreign feeling that the foreign ministers at Peking had to bring up guards from the fleet for the protection of the legations, and to demand the removal from the capital of the disorderly Kansu soldiery which subsequently played so sinister a part in the troubles of June 1900. But the unpleasant impression produced by these incidents was in a great measure removed by the demonstrative reception which the empress Tsu Tsi gave on 15th October to the wives of the foreign representatives—an international act of courtesy unprecedented in the annals of the Chinese court.

***Manchu ascendancy.***

One of the most significant features of the *coup d'état* of 1898 was the decisive part played in it by the Manchus, whose ascendancy in the councils of the dowager-empress became more and more marked. Manchus were substituted for Chinamen in many of the higher offices of the state, and even Li Hung-Chang's position was shaken. Though he was the only prominent Chinese statesman who had actively supported the empress, he was temporarily removed from the capital, under pretext of a special mission to inspect the course of the Yellow river in Shantung. The reactionary tide continued to rise throughout the year 1899, but it did not appear materially to affect the foreign relations of China, the dilatoriness and ill-will exhibited by the Tsung-Li-Yamen with respect to the punishment of the murderers of Mr Fleming and to other anti-foreign outrages amounting to little more than the usual practice of the Chinese Government in such matters. On 24th January 1900 the *Peking Gazette* published an imperial edict appointing as heir-presumptive to the throne Pu Chün, a son of Prince Tuan (himself son to Prince Tun and grandson to the emperor Tao-kwang), which was generally regarded in China as a preliminary step to the formal deposition of the emperor Kwang Su. Influential memorials from Chinese officials deprecating any such measure would seem to have deterred the empress from following up her original intention, but the choice of two rabid anti-foreign officials as tutors to Pu Chün, together with the prestige conferred upon Prince Tuan, one of the most reactionary of the Manchu princes, afforded a startling indication of the spirit which already prevailed in court circles.

***The Boxer movement.***

A few weeks earlier the brutal murder of Mr Brooks, an English missionary, in Shantung, had compelled attention to a popular movement which had been spreading rapidly throughout that province and the adjoining one of Chih-li with the connivance of certain high officials, if not under their direct patronage. The origin of the "Boxer" movement is obscure. Its name is derived from a literal translation of the Chinese designation, "The fist of righteous harmony." Like the kindred "Big Sword" Society, it appears to have been in the first instance a secret association of malcontents chiefly drawn from the lower classes. Popular disaffection in China generally assumes some such shape, and there can be little doubt that with the waning prestige of the dynasty, undermined by the Japanese war and foreign encroachments, not less than by the family feud between the emperor and the dowager-empress, a dangerous spirit of unrest was abroad amongst all classes. The Tsing dynasty was reaching what would seem to be the allotted span of Chinese dynasties, its tenure of power having already lasted longer than that of any of the last twenty dynasties, excepting its immediate predecessors, the Mings, and neither omens nor predictions were wanting to foreshadow its downfall. Whether the empress Tsu Tsi and her Manchu advisers had deliberately set themselves from the beginning to avert the danger by deflecting what might have been a revolutionary movement into anti-foreign channels, or whether with Oriental heedlessness they had allowed it to grow until they were powerless to control it, they had unquestionably resolved to take it under their protection before the foreign representatives at Peking had realised its gravity. Yü Hsien, one of its earliest patrons, had indeed been recalled on their representations from Shantung, where he had given open support to the Boxer organization, but only to be loaded with honours by the empress and transferred to the province of Shansi. The outrages upon native Christians and the threats against foreigners generally went on increasing. The Boxers openly displayed on their banners the device: "Exterminate the foreigners and save the dynasty," yet the representatives of the Powers were unable to obtain any effective measures against the so-called "rebels," or even a definite condemnation of their methods.

***Diplomacy at bay.***

Four months (January-April 1900) were spent in futile interviews with the Tsung-Li-Yamen, who, encouraged, no doubt, by the fact that the Russian minister for a long time held conspicuously aloof from the protests of his colleagues, treated the remonstrances of the Powers with growing contempt. In May a number of Christian villages were destroyed and native converts massacred in the neighbourhood of the capital, and Mgr. Favier, the venerable head of the Roman Catholic missions in China, described the situation as the gravest within his long memory. On the 2nd June two English missionaries, Mr Robinson and Mr Norman, were murdered at Yung Ching, 40 miles from Peking. The whole country was overrun with bands of Boxers, who tore up the railway and set fire to the stations at different points on the Peking-Tientsin line. Fortunately a mixed body of marines and bluejackets of various nationalities, numbering 18 officers and 389 men, had reached Peking on 1st June for the protection of the legations. The whole city was in a state of turmoil. Murder and pillage were of daily occurrence. Prince Tuan and the Manchus generally, together with the Kansu soldiery under the notorious Tung-fu-hsiang, openly sided with the Boxers. The European residents and a large number of native converts took refuge in the British legation, the largest and most central compound in the foreign quarter, where preparations were hastily made on all sides in view of a threatened attack. On the 11th the chancellor of the Japanese legation was murdered by Chinese soldiers. On the night of the 13th most of the foreign buildings, churches, and mission houses in the eastern part of the Tartar city were pillaged and burnt, and hundreds of native Christians massacred. The work of destruction continued for days unchecked by any Chinese authority, and on 20th June the German minister, Baron von Ketteler, was murdered whilst on his way to the Tsung-Li-Yamen, and there is little doubt that the same fate had been prepared for all the other foreign representatives, who were expected to visit the Yamen, as negotiations were proceeding with regard to a summons sent to them on the previous day to leave Peking within twenty-four hours. At 4 P.M. on the afternoon of the 20th the Chinese troops opened fire upon the legations, and the eight weeks' siege began which will remain memorable in history as one of the most splendid instances of what the heroism and intelligence of a handful of Europeans can achieve against Asiatic hordes.

***Action of the Powers.***

Meanwhile Peking had been completely cut off since the 14th from all communication with the outside world, and in view of the gravity of the situation, naval and military forces were being hurried up by all the Powers to the gulf of Pe Chili. On 10th June Admiral Seymour had already left Tientsin with a mixed force of 2000 British, Russian, French, Germans, Austrians, Italians, Americans, and Japanese, to repair the railway and restore communication with Peking. But his expedition met with unexpectedly severe resistance, the line was torn up in its rear, and, unprovided with transport or supplies, it had great difficulty in making good its retreat after suffering heavy losses. Great anxiety prevailed for some days as to its fate, and no definite tidings of its whereabouts were received until it had fought its way back to within a day's march of Tientsin. When it reached Tientsin again on 26th

June, the British contingent of 915 men had alone lost 124 killed and wounded out of a total casualty list of 62 killed and 218 wounded. The Chinese had in the meantime made a determined attack upon the foreign settlements at Tientsin, and communication between the city and the sea being also threatened, the allied admirals had demanded on the 16th the surrender of the Taku forts at the mouth of the Pei-ho. The Chinese replied to the ultimatum by opening fire with great vigour during the following night, whereupon a flotilla of British, French, German, Japanese, and Russian gunboats bombarded the forts, which were captured by landing parties early on the 17th. The situation at Tientsin, nevertheless, continued precarious, and it was not till the arrival of considerable reinforcements that the troops of the allied Powers were able to assume the offensive, taking the native city by storm on 14th July, at a cost, however, of over 700 killed and wounded. Even in this emergency international jealousy had grievously delayed the necessary concentration of forces. Three British brigades were ordered up from India, a few French colonial regiments were sent on from Saigon, the Americans detached a body of troops from the Philippines, the Russians despatched a brigade from Port Arthur, though their military resources were severely taxed by the simultaneous outbreak of hostilities in Manchuria, and preparations were made in Germany, France, and Italy, to send out fresh contingents, the German force alone numbering over 20,000 men. But the situation required immediate action. No power was so favourably situated to take such action as Japan, and the British Government, who had strongly urged her to act speedily and energetically, undertook at her request to sound the other Powers with regard to her intervention. No definite objection was raised, but the replies of Germany and Russia barely disguised their ill-humour. Great Britain herself went so far as to offer Japan the assistance of the British treasury, in case financial difficulties stood in the way, but on the same day on which this proposal was telegraphed to Tokio (6th July), the Japanese Government had decided to embark forthwith the two divisions which it had already mobilized. By the beginning of August one of the Indian brigades had also reached Tientsin, together with smaller reinforcements sent by the other Powers, and thanks chiefly to the energetic counsels of the British commander, General Sir Alfred Gaselee, a relief column, numbering 20,000 men, at last set out for Peking on 4th August, a British naval brigade having started up river the previous afternoon. It met with only half-hearted resistance, and after a series of small engagements and very trying marches it arrived within striking distance of Peking on the evening of the 13th. The Russians tried to steal a march upon the allies during the night, but were checked at the walls and suffered heavy losses. The Japanese attacked another point of the walls the next morning, but met with fierce opposition, whilst the Americans were delayed by getting entangled in the Russian line of advance. The British contingent was more fortunate, and skilfully guided to an unguarded water-gate, General Gaselee and a party of Sikhs were the first to force their way with trifling loss through to the British legation. About 2 P.M. on the afternoon of 14th August, the long siege was raised.

***The siege of the legations.***

For nearly six weeks after the first interruption of communications, no news reached the outside world from Peking except a few belated messages, smuggled through the Chinese lines by native runners, urging the imperative necessity of prompt relief. During the greater part of that period the foreign quarter was subjected to heavy rifle and artillery fire, and the continuous fighting at close quarters with the hordes of Chinese regulars, as well as Boxers, decimated the scanty ranks of the defenders. The supply of both ammunition and food was slender. But the heroism displayed by civilians and professional combatants alike was inexhaustible. Some of the legations were totally or partially destroyed. In their anxiety to burn out the British legation, the Chinese did not hesitate to set fire to the adjoining buildings of the Hanlin, the ancient seat of Chinese classical learning, and the storehouse of priceless literary treasures and state archives. The *Fu*, or palace, of Prince Su, separated only by a canal from the British legation, formed the centre of the international position, and was held with indomitable valour by a small Japanese force under Colonel Sheba, assisted by a few Italian marines and volunteers of other nationalities and a number of Christian Chinese. The French legation on the extreme right, and the section of the city wall held chiefly by Germans and Americans, were also points of vital importance which had to bear the brunt of the Chinese attack. Little is known as to what passed in the councils of the Chinese court during the siege. But there is reason to believe that throughout that period grave divergences of opinion existed amongst the highest officials. The attack upon the legations appears to have received the sanction of the dowager-empress, acting upon the advice of Prince Tuan and the extreme Manchu party, at a grand council held during the night of 18th-19th June, upon receipt of the news of the capture of the Taku forts by the international forces. The emperor himself, as well as Prince Ching and a few other influential mandarins, strongly protested against the empress's decision, but it was acclaimed by the vast majority of those present. The moderate party was probably not in a position to do more than act as a drag upon the more violent faction. Three members of the Tsung-Li-Yamen were publicly executed for attempting to modify the terms of an imperial edict ordering the massacre of all foreigners throughout the provinces, and most of the Manchu nobles and high officials, and the eunuchs of the palace, who have played an important part in Chinese politics throughout the dowager-empress's tenure of power, were heart and soul with the Boxers. But it was noted by the defenders of the legations that Prince Ching's troops seldom took part, or only in a half-hearted way, in the fighting, which was chiefly conducted by Tung-fu-hsiang's soldiery and the Boxer levies. The modern artillery which the Chinese possessed was only spasmodically brought into play. Nor did any of the attacking parties ever show the fearlessness and determination which the Chinese had somewhat unexpectedly displayed on several occasions during the fighting at and around Tientsin. Nevertheless, the position of the defenders at the end of the first four weeks of the siege had grown well-nigh desperate. Mining and incendiarism proved far greater dangers than shot and shell. The Japanese had been forced back to their third and last line of defence in the *Fu*, and two-thirds of the French legation had been destroyed or wrested from its heroic defenders. The British legation was being hard pressed from the Mongol market as well as from the Imperial Carriage Park, and the firing on the city walls was severe and unceasing. The casualty list, amongst the officers especially, was heavy, and the need of constant watchfulness along the whole line of defences was a great strain upon the physical endurance of the attenuated garrison. Suddenly, just when things were looking blackest, on the 17th of July the Chinese ceased firing, and a sort of informal armistice secured a period of respite for the beleaguered Europeans. The capture of the native city of Tientsin by the allied forces had shaken the self-confidence of the Chinese authorities, who had hitherto not only countenanced, but themselves directed the hostilities. By a curious coincidence it was just at the time when the besiegers were relaxing their efforts that the intense anxiety of the civilized world with regard to the fate of the besieged reached its culminating point. Circumstantial accounts of the fall of the legations and the massacre of their inmates were circulated in Shanghai and telegraphed to Europe, and coupled with the despairing tone of the few messages which had been smuggled out of Peking in June—more especially Sir Robert Hart's message of 24th June—and with the admissions made by Chinese provincial officials, these reports found general credence. Mr Brodrick, under-secretary of state for Foreign Affairs, officially stated in the House of Commons on 17th July, that though the British Government had no direct confirmation of these painful rumours, they had, unfortunately, little reason to regard them as otherwise than substantially correct. It was not till the following week that an authentic message received through the Chinese legation at Washington from the American minister proved these fears to be premature. Similar telegrams followed from Sir Claude Macdonald and other foreign representatives, and various communications from the Chinese Government, though the pacific assurances they contained were largely mendacious, showed that they were at any rate growing alarmed at the consequences of their outrageous action. Desultory fighting, nevertheless, continued, and grave fears were entertained that the approach of the relief column would prove the signal for a desperate attempt to rush the legations before effectual assistance could reach them. The attempt was made, but failed. The relief, however, came not a day too soon. Of the small band of defenders which, including civilian volunteers, had never mustered 500, 65 had been killed and 131 wounded. Ammunition and provisions were almost at an end. Even more desperate was the situation at the Pei-tang, the Roman Catholic northern cathedral and mission house, where with the help of a small body of French and Italian marines, Mgr. Favier had organized an independent centre of resistance for his community of over 3000 souls. Their rations were absolutely exhausted, when on 15th August a relief party was despatched to their assistance from the legations.

***The condition of Peking.***

The ruin wrought in Peking during the two months' fighting was appalling. Apart from the wholesale destruction of foreign property in the Tartar city—mission houses, churches, hospitals, native stores where foreign goods had been sold, native houses suspected of any connexion or sympathy with foreigners—and of Chinese as well as European buildings in the vicinity of the legations, the wealthiest part of the Chinese city had been laid in ashes. The flames from a foreign drug store fired by the Boxers had spread to the adjoining buildings, and finally consumed the whole of the business quarter with all its invaluable stores of silks, curiosities, furs, &c. The retribution which overtook

Peking after its capture by the international forces was scarcely less terrible. Looting was for some days almost universal. But it would have been well, for the credit of Western civilization and Christianity, had the reprisals exercised by some of the foreign contingents been confined to looting. The whole city was divided up into separate areas of occupation between the contingents of different nationalities, and in the Russian and French quarters unbridled license prevailed for some time. It should be added that the French force at that period consisted chiefly of colonial troops from Tongking and Annam. Order was, however, gradually restored, first in the Japanese and then in the British and American quarters, though several months elapsed before there was any real revival of native confidence.

*The flight of the Chinese court.*

So unexpected had been the rapid and victorious advance of the allies, that the dowager-empress with the emperor and the rest of the court did not actually leave Peking until the day after the legations had been relieved. But the northern and western portions of the Tartar city had not yet been occupied, and the fugitives made good their escape on the afternoon of the 15th in the direction of the Western Hills. When the allies some days later marched through the Forbidden City, they only found a few eunuchs and subordinate officials in charge of the imperial apartments. At the end of September, Field-Marshal Count von Waldersee, with a German expeditionary force of over 20,000 men, arrived to assume the supreme command conferred upon him with the more or less willing assent of the other Powers. As a matter of fact, his authority was never practically recognized by either the French or the American commanders, and was only effectively exercised over the British and the small Italian and Austrian contingents. A large portion of the Japanese troops was shipped back to Japan soon after the relief of the legations, and the bulk of the Russian forces was withdrawn into Manchuria. There were indeed no longer any important military operations to be carried out. After a few punitive expeditions had been sent to Paoting-fu and other districts in the neighbourhood of Peking, where exceptionally brutal outrages had been committed during the summer, the duties of the foreign troops were henceforth chiefly in the nature of police work. The Germans, however, having arrived too late to take any part in the relief of Peking, often showed a mischievous anxiety to extend the sphere of operations. Their discipline, especially in their treatment of the defenceless Chinese population, fell lamentably short of the high standard expected from a great military nation, and their predatory raids in search of Boxers resulted only in increasing the confusion and misery which prevailed in the zone of foreign occupation. The removal by the Germans of the ancient astronomical instruments from Peking was condemned even in the German press as an act of unjustifiable vandalism. Towards the end of February 1900 preparations were made at the German headquarters for an extensive forward movement in the direction of Si-nghan-fu, but it was ultimately abandoned, owing to the refusal of the other Powers, and more especially of Great Britain and Japan, to countenance such an adventurous enterprise. Strangely enough, the German contingent, which saw less actual fighting than any other foreign force, suffered the two most conspicuous losses during the whole campaign. Count York, a staff officer of the greatest promise, died of asphyxia in a Chinese inn during a winter march, and General von Schwarzhoff, chief of the staff to Count von Waldersee, lost his life in the fire which destroyed the apartments in the Winter Palace occupied by the German headquarters (17th April).

*The political situation.*

The political task which confronted the Powers after the occupation of Peking was far more arduous than the military one. The action of the Russians in Manchuria, even in a treaty port like New-chwang, the seizure of the railway line not only to the north of the Great Wall, but also from Shan-hai-kwan to Peking, by the Russian military authorities, and the appropriation of an extensive line of river frontage at Tientsin as a Russian "settlement," were difficult to reconcile with the pacific assurances of disinterestedness which Russia, like the rest of the Powers, had officially given. Great anxiety prevailed as to the effect of the flight of the Chinese court in other parts of the empire. The anti-foreign movement had not spread much beyond the northern provinces, in which it had had the open support of the throne and of the highest provincial officials. But amongst British and Americans alone, over 200 defenceless foreigners, men, women, and children, chiefly missionaries, had fallen victims to the treachery of high-placed mandarins like Yü Hsien, and hundreds of others had had to fly for their lives, many of them owing their escape to the courageous protection of petty officials and of the local gentry and peasantry. The Roman Catholic missionaries and communities throughout the north had met, or been threatened, with the same fate, and sporadic outbreaks such as that which had occurred at Su-chan, south of the Yangtse, showed that there were explosive materials scattered all over the empire. In the Yangtse valley order had been maintained by the energy of the viceroys of Nanking and Wu-chang, who had acted throughout the critical period in loyal co-operation with the British consuls and naval commanders, and had courageously disregarded the imperial edicts issued during the ascendancy of the Boxers. After some hesitation, an Indian brigade, followed by French, German, and Japanese contingents, had been landed at Shanghai for the protection of the settlements, and though the viceroy, Liu Kun-yi, had welcomed British support, and even invited the joint occupation of the Yangtse forts by British and Chinese troops, the appearance of other European forces in the Yangtse valley was viewed with great suspicion. In the south there were serious symptoms of unrest, especially after Li Hung-Chang had left Canton for the north, in obedience, as he alleged at the time, to an imperial edict which, there is reason to believe, he invented for the occasion. The Chinese court, after one or two intermediate halts, had retired to Si-nghan-fu, one of the ancient capitals of the empire, situated in the inaccessible province of Shen-si, over 600 miles south-west of Peking. The influence of the ultra-reactionaries, headed by Prince Tuan and General Tung-fu-hsiang, still dominated its councils, although edicts, illusory if genuine, were from time to time stated to have been issued for the punishment of some of the leading officials concerned in the anti-foreign outrages, and credentials were sent to Prince Ching and to Li Hung-Chang, who, after waiting for some weeks upon events at Shanghai, had proceeded to Peking, authorizing them to treat with the Powers for the re-establishment of friendly relations.

*The Anglo-German agreement.*

On 16th October the Anglo-German agreement, to which reference has already been made, was signed in London, and its publication immediately upon signature created some excitement at the time. The negotiations which had led up to it had been conducted with great celerity and secrecy, and it would appear, from a despatch which was subsequently published from Lord Salisbury to the British representative in St Petersburg, that the British negotiator was in no small degree influenced by the aggressive features of Russia's action at the time in northern China. Germany, on the other hand, would seem to have been chiefly actuated by the desire to forestall any isolated action on the part of Great Britain in the Yangtse valley. The agreement certainly had no immediate effect upon the political situation. It did not modify Germany's attitude with regard to Russia, for Count von Waldersee continued to lend his support as far as possible to the Russian military authorities in northern China whenever differences of opinion arose between them and the British, and the German Government a few months later openly denied that the agreement applied to Manchuria, in spite of the contrary opinion entertained by the British Government. But it has given Germany a claim to a footing in the Yangtse valley which it is difficult to reconcile with the policy propounded by British ministers when they published the Yangtse "assurance," obtained in 1898 from the Tsung-Li-Yamen. In one of his statements to the Reichstag, the imperial chancellor referred to the Anglo-German agreement as "the Yangtse agreement," and that designation has ever since been universally adopted in Germany.

*The negotiations.*

The harmony of the Powers, which had been maintained with some difficulty up to the relief of the legations, was subjected to a severe strain as soon as the basis of negotiations with the Chinese Government came to be discussed. The eleven Powers having diplomatic representatives in Peking, including, therefore, such minor Powers as Spain, Holland, and Belgium, claimed to have an equal voice in these discussions, and the conferences held between the foreign ministers in the Chinese capital had constantly to be supplemented by references to their governments and by prolonged correspondence between the different cabinets. While for various reasons Russia, Japan, and the United States were inclined to treat China with great indulgence, Germany insisted upon the signal punishment of the guilty officials as a *conditio sine quâ non*, and in this she had the support not only of the other members of the Triple Alliance, whose interests in China were only of secondary importance, but also of Great Britain, and to some extent even of France, who, as protector of the Roman Catholic Church in Eastern countries, could not allow the authors of the atrocities committed upon its followers to escape effectual punishment. It was not until after months of laborious negotiations that an agreement was finally arrived at with regard to the general tenour of the demands to be formally made upon the Chinese Government. They were embodied in a joint note signed by all the foreign ministers on 20th and 21st December 1900. The preamble recited the chief crimes committed by the Chinese, denounced the treachery of the Chinese Government in declaring, through its representatives abroad, that it was protecting the legations while it was actually besieging them, and announced that the allied Powers consented to accede to China's petition for peace on "irrevocable conditions" therein stated. These were substantially as follows :—Honourable reparation for

the murder of Baron von Ketteler and of M. Sugiyama was to be made in a specified form, and expiatory monuments were to be erected in cemeteries where foreign tombs had been desecrated. "The most severe punishment befitting their crimes" was to be inflicted on the personages designated by the decree of 21st September, and also upon others to be designated later by the foreign ministers, and the official examinations were to be suspended in the cities where foreigners had been murdered or ill-treated. An equitable indemnity, guaranteed by financial measures acceptable to the Powers, was to be paid to states, societies, and individuals, including Chinese who had suffered because of their employment by foreigners, but not including Chinese Christians who had suffered only on account of their faith. The importation or manufacture of arms or *matériel* was to be forbidden; permanent legation guards were to be maintained at Peking, and the diplomatic quarter was to be fortified, while communication with the sea was to be secured by a foreign military occupation of the strategic points and by the demolition of the Chinese forts, including the Taku forts, between the capital and the coast. Proclamations were to be posted throughout China for two years, threatening death to the members of anti-foreign societies, and recording the punishment of the ringleaders in the late outrages; and the viceroys, governors, and provincial officials were to be declared by imperial edict responsible, on pain of immediate dismissal and perpetual disability to hold office, for anti-foreign outbreaks or violations of treaty within their jurisdictions. China was to facilitate commercial relations by negotiating a revision of the commercial treaties. The Tsung-Li-Yamen was to be reformed, and the ceremonial for the reception of foreign ministers modified as the Powers should demand. Compliance with these terms was declared to be a condition precedent to the arrangement of a time limit to the occupation of Peking and of the provinces by foreign troops.

Under instructions from the court, the Chinese plenipotentiaries affixed their signatures on 14th January 1901 to a protocol, by which China pledged herself to accept these terms in principle, and the conference of ministers then proceeded to discuss the definite form in which compliance with them was to be exacted. This further stage of the negotiations proved even more laborious and protracted than the preliminary proceedings. No attempt was made to raise the question of the dowager-empress's responsibility for the anti-foreign movement, as Russia had from the first set her face against the introduction of what she euphemistically termed "the dynastic question." But even with regard to the punishment of officials whose guilt was beyond dispute, grave divergences arose between the Powers. The death penalty was ultimately waived in the case even of such conspicuous offenders as Prince Tuan and Tung-fu-hsiang, but the notorious Yü Hsien and two others were decapitated by the Chinese, and three other metropolitan officials were ordered to commit suicide, whilst upon others sentences of banishment, imprisonment, and degradation were passed, in accordance with a list drawn up by the foreign representatives. The question of the punishment of provincial officials, responsible for the massacre of scores of defenceless men, women, and children, was unfortunately reserved for separate treatment, and, when it came up for discussion, it became impossible to preserve even the semblance of unanimity, the Russian minister at once taking issue with his colleagues, although he had originally pledged himself as formally as the others to the principle. Count Lamsdorff frankly told the British ambassador at St Petersburg that Russia took no interest in missionaries, and as the foreigners massacred in the provinces belonged mostly to that class, she declined to join in the action of the other Powers. Fortunately the rest of the Powers, including even Japan, who, as a non-Christian state, might have been excused for adopting the same attitude as Russia, preserved a united front, and though the satisfaction ultimately obtained was not altogether adequate, the list of punishments proposed by the British minister, Sir Ernest Satow, was presented to the Chinese plenipotentiaries with the signatures of all the foreign representatives except the Russian.

***The Manchurian convention.***

The real explanation of Russia's cynical secession from the concert of Powers on this important issue must be sought in her anxiety to conciliate the Chinese in view of the separate negotiations in which she was at the same time engaged with China in respect of Manchuria. When the Boxer movement was at its height at the end of June 1900, the Chinese authorities in Manchuria had wantonly "declared war" against Russia, and for a moment a great wave of panic seems to have swept over the Russian administration, civil and military, in the adjoining provinces. The reprisals exercised by the Russians were proportionately fierce. The massacre at Blagovestchensk, where 5000 Chinese—men, women, and children—were flung into the Amur by the Cossacks, was only one incident in the reign of terror by which the Russians sought to restore their power and their prestige. The resistance of the Chinese troops was soon overcome, and Russian forces overran the whole province, occupying even the treaty port of New-chwang. The Russian Government officially repudiated all responsibility for the proclamations issued by General Gribsky and others, foreshadowing, if not actually proclaiming, the annexation of Chinese territory to the Russian empire. But Russia was clearly bent on seizing the opportunity for securing a permanent hold upon Manchuria. In December 1900 a preliminary agreement was made between M. Korostovetz, the Russian administrator-general, and Tseng, the Tartar general at Mukden, by which the civil and military administration of the whole province was virtually placed under Russian control. In February 1901 negotiations were opened between the Russian Government and the Chinese minister at St Petersburg for the conclusion of a formal convention of a still more comprehensive character. The Russian Government refused to disclose its terms, but the draft prepared by the Russian Foreign Office was informally communicated through Chinese channels to the British and other friendly governments. In return for the restoration to China of a certain measure of civil authority in Manchuria, Russia was to be confirmed in the possession of exclusive military, civil, and commercial rights, constituting in all but name a protectorate, and she was also to acquire preferential rights over all the outlying provinces of the Chinese empire bordering on the Russian dominions in Asia. The clauses relating to Chinese Turkestan, Kashgar, Yarkand, Khotan, and Mongolia were subsequently stated to have been dropped, but the convention nevertheless provoked considerable opposition both in foreign countries and amongst the Chinese themselves. Most of the Powers, including Germany, who, however, denied that the Anglo-German agreement of 16th October 1900 applied to Manchuria, advised the Chinese Government not to pursue separate negotiations with one Power whilst collective negotiations were in progress at Peking, and both Japan and Great Britain pressed for definite information at St Petersburg with regard to the precise tenour of the proposed convention. At the same time the two viceroys of the lower Yangtse memorialized the Throne in the strongest terms against the convention, and these protests were endorsed not only by the great majority of Chinese officials of high rank throughout the provinces, but by popular meetings and influential guilds and associations. Ultimately the two viceroys, Chang Chih-tung and Liu Kun-yi, took the extreme step of warning the Throne that they would be unable to recognize the convention, even if it were ratified, and notwithstanding the pressure exercised in favour of Russia by Li Hung-Chang, the court finally instructed the Chinese minister at St Petersburg to decline his signature. The attitude of Japan, where public feeling ran high, was equally significant, and on 3rd April the Russian Government issued a circular note to the Powers, stating that, as the generous intentions of Russia had been misconstrued, she withdrew the proposed convention.

***The peace protocol.***

The work of the conference at Peking, which had been temporarily disturbed by these complications, was then resumed, and soon reached a stage which brought the possibility of an early evacuation within the range of discussion. It was generally felt that the prolonged occupation and the inaction to which the majority of the foreign troops were necessarily condemned were detrimental to the maintenance of discipline, and the friction which led to such unpleasant incidents as those which occurred in March and April at Tientsin, where conflicts between British troops and French, Germans, and Russians were with difficulty averted, gave additional cause for anxiety. The Anglo-Russian dispute over the construction of certain roads and railway sidings at Tientsin also showed that, although the Russians had been induced to hand over the Peking-Shan-hai-kwan railway (18th January) to the German military authorities, who in their turn surrendered it (21st February) to the British, an international occupation was still fraught with manifold dangers. Early in April Count von Waldersee invited all the foreign commanders to meet him and discuss the feasibility of a partial withdrawal of troops. The discussion led to no immediate results, but it helped to stimulate the proceedings of the diplomatists. The question of indemnities, however, gave rise to renewed friction. Each Power drew up its own claim, and whilst Great Britain, the United States, and Japan displayed great moderation, other Powers, especially Germany and Italy, put in claims which were strangely out of proportion to the services rendered by their military and naval forces. Not only the amount of the indemnity, but the mode of payment and the ear-marking of revenues out of which China was to meet it, gave rise to great differences of opinion. Germany proposed an immediate 10 per cent. increase of the Chinese customs tariff on foreign imports, but this proposal met with determined opposition from other commercial Powers, and especially from Great Britain, whose trade would have to bear the chief part of the burden. It was at last settled that China should pay altogether an indemnity of 450 million taels, to be secured (1) on the unhypothecated balance of the customs revenue administered by the imperial maritime customs, the import duties

being raised forthwith to an effective 5 per cent. basis; (2) on the revenues of the "native" customs in the treaty ports; (3) on the total revenues of the salt gabelle. Finally, after more than sixty plenary conferences and innumerable meetings of sub-committees had been held by the diplomatists in Peking, the peace protocol was drawn up in a form which satisfied all the Powers as well as the Chinese court. The formal signature was, however, delayed at the last moment by a fresh difficulty concerning Prince Chun's penitential mission to Berlin. The prince, an amiable and enlightened youth, half-brother to the emperor, had reached Basel towards the end of August on his way to Germany, when he was suddenly informed that he and his suite would be expected to perform *kotow* before the German emperor. The prince resented this unexpected demand, and referred home for instructions. The Chinese court appear to have remained obdurate, and the German Government perceived the mistake that had been made in exacting from the Chinese prince a form of homage which Western diplomacy had for more than a century refused to yield to the Son of Heaven, on the ground that it was barbarous and degrading. The point was waived, and Prince Chun was received in solemn audience by the Emperor William at Potsdam on 4th September. Three days later, on 7th September, the peace protocol was signed at Peking by the two Chinese plenipotentiaries and the representatives of Great Britain, Germany, France, Russia, the United States, Japan, Austria-Hungary, Italy, the Netherlands, Belgium, and Spain.

Article 1 recorded the satisfaction to be given to Germany for the murder of Baron von Ketteler.

Article 2 recited the punishments inflicted on the guilty officials and the posthumous honours rendered to the three mandarins who had been executed during the siege for their endeavours to stem the anti-foreign movement. It also placed on record the suspension of official examinations in all cities where anti-foreign outrages of an aggravated character had been perpetrated.

Article 3 recorded the satisfaction to be given to Japan for the murder of M. Sugiyama.

Article 4 provided for the erection by the Chinese of expiatory monuments.

Article 5 dealt with the prohibition of the importation of arms and warlike material.

Article 6 set forth the amount and mode of payment of the indemnity.

Articles 7, 8, and 9 defined the area of the new legation quarter at Peking, and dealt with its protection and with that of the railway and the whole line of communication between Peking and the sea.

Article 10 recorded the measures taken by the Chinese Government to prevent the recurrence of anti-foreign agitation or troubles.

Article 11 provided for the amendment of existing treaties of commerce and navigation, and for river conservancy measures at Tientsin and Shanghai.

Article 12 dealt with the reorganization of the Chinese Ministry of Foreign Affairs, and modifications of court ceremonial as regards the reception of foreign representatives.

The British Government at once appointed a Special Commission, with Sir J. Mackay, member of the Council of India, as chief commissioner, to proceed to Shanghai to carry on the commercial negotiations, provided for in article 11, with the commissioners appointed by China. These negotiations were also to deal with the removal of existing obstacles to foreign trade, such as *likin*, &c., and with regulations for facilitating steamer navigation on inland waters.

In accordance with the terms of the protocol, all the foreign troops, with the exception of the legation guards, were withdrawn from Peking on 17th September, and from the rest of Chih-li, with the exception of the garrisons at the different points specified along the line of communications, by 22nd September. On 7th October it was announced that the Chinese court had left Si-nghan-fu on its way back to the northern capital. A month later (7th November) the death of Li Hung-Chang at Peking removed, if not the greatest of Chinese statesmen, at any rate the one who had enjoyed a larger share of the empress-dowager's confidence and figured in the eyes of the outside world more prominently than any other during that long chapter of wasted opportunities which had opened for the Chinese empire after the suppression of the great Taiping rebellion, and was brought to a close by the Boxer movement, the international occupation of Peking, and the peace protocol of 1901.

With this settlement a new era opens. What it will produce none can venture to foretell. On the one hand, the Powers have been induced to display great leniency with regard to the punishment of the court and the high officials implicated in the anti-foreign outrages of 1900; and on the other, the pecuniary compensation they have exacted is calculated to weigh heavily on the Chinese people, and on the innocent not less than on the guilty. In the north of China the excesses committed by some of the foreign contingents unquestionably lowered the reputation of all Western powers collectively, notwithstanding the high standard of discipline maintained by the British, American, and Japanese forces, and by the later French contingent sent out direct from France. It must be noted also that amongst progressive Chinese officials a widespread feeling of disappointment prevailed that the Powers should have failed to avail themselves of the opportunity to insist upon the introduction of administrative reforms into China. The necessity of such reforms had been more widely realized by the Chinese themselves during the recent crisis than at any previous moment in the modern history of China, and several high officials like the Yangtse viceroys, the viceroy of Canton, and the governor of Shantung, Yuen Shih-kai, one of the ablest of the young Chinese mandarins, repeatedly memorialized the Throne in this sense. Imperial edicts were from time to time issued from Si-nghan-fu announcing important reforms, especially in the system of education and qualifications for the public service, but their value remained speculative so long as most of the appointments made by the court continued to be bestowed on members of the old reactionary party.

**China-Japan War of 1894-95.**—The causes of the war between China and Japan arose out of the rival claims of the two Powers to assert influence in Korea. It was an old tradition in Japan, dating back to the legendary achievements of the Emperor Jingu, that Korea occupied a position of quasi-vassalage to the empire. At the end of the 16th century an expedition sent by the Emperor Hideyoshi occupied Seoul and Phyong-yang. The Koreans invoked the aid of China, and after a prolonged war the Japanese forces were withdrawn shortly before the death of Hideyoshi. Inadequate sea power, rendering the supply of the Japanese troops precarious, seems to have been the cause of the ultimate failure, although the Chinese were frequently defeated in the field. In 1627, and again in 1637, Korea was invaded from the north by the Manchus, who soon afterwards established their dynasty at Peking. According a purely nominal allegiance to China, the Koreans subsequently maintained their isolation for more than two centuries. After the revolution which ended in 1868—when Japan, adopting Western reforms, started upon a wonderful career of progress—it was natural that her ambitions in regard to Korea should receive a fresh impulse. In 1875 a Japanese force landed on Kang-hwa Island, and after a naval demonstration at Chemulpo a treaty was obtained opening Fusan to Japanese trade. From this time Japan began to play an active part in Korean affairs, and under her influence a progressive party arose in Seoul, which soon found itself in conflict

with the ways of the mass of the people. In July 1882 the legations were burned by a mob and some Japanese officers were massacred. The minister who succeeded in reaching the sea and escaping was sent back with a military escort, and an indemnity was demanded and obtained. The Chinese at the same time sent a small force to Korea. In December 1884 a fresh outbreak occurred at Seoul. A plot to seize the king and establish a progressive government failed, and the Japanese were again driven out of the capital by the Koreans, assisted by Chinese. Japan sent troops and enforced the payment of a second indemnity. In April 1885 a convention was signed at Tientsin by Count Ito and Li Hung-Chang, by which both Powers undertook to withdraw their military forces from Korea, each being pledged to inform the other of any decision to despatch troops in the event of future disturbances. This convention secured comparative tranquillity in Korea for nine years. The murder at Shanghai, on 28th March 1894, of Kim-ok-kim, one of the leaders of the abortive revolution of 1884, created much excitement in Seoul, where the Tong-Hak rebellion was beginning to cause alarm. At the end of May the Tong-Haks defeated the Korean forces, and early in June the Government appealed to China for military assistance. A small Chinese force was at once sent to Asan; and the Japan Government being informed, according to the terms of the convention of Tientsin, promptly ordered its minister, Otori, who was on leave, to return to Seoul. Warships were sent to Chemulpo, and Otori with an escort of marines reached Seoul on 10th June. The Japanese rapidly followed up this step by the despatch of about 5000 troops under Major-General Oshima, who relieved the marines by the middle of June. A complicated situation thus arose. Chinese troops were present in Korea by the request of the Government with a view to put down an armed rebellion. The Japanese controlled the capital, and were determined to carry out reforms by force if necessary. An interesting diplomatic correspondence led only to a deadlock. Japan absolutely declined to recognize Korea "as a tributary state of China," to limit her military forces in the peninsula, or to place any restrictions upon their movements; but she proposed that the two Powers should "unite their efforts for the speedy suppression of the disturbance," and should subsequently send commissioners to inaugurate jointly certain specified measures of reform. The Tsung-Li-Yamen considered that "the idea may be excellent, but the measures of reform must be left to Korea herself. Even China herself would not interfere with the internal administration of Korea, and Japan having from the very first recognized the independence of Korea, cannot have the right to interfere." The Japanese foreign minister replied that "the Imperial Government, much to their regret, cannot share the hopeful views" thus expressed, and considered that the government of Korea "is lacking in some of the elements which are essential to responsible independence." Ultimately—on 16th July—the Tsung-Li-Yamen was informed that as the Chinese Government appeared "disposed to precipitate complications," Japan was "relieved of all responsibility for any eventuality that may in future arise." War was now inevitable unless the Peking Government was willing to abdicate all claims over Korea. The claims were valueless; but Chinese troops were already in the country by invitation, and in these circumstances it was not to be expected that the shadowy suzerainty would be abandoned.

At Seoul the issue was forced by the Japanese minister, who delivered an ultimatum to the Korean Government on 20th July. On the 23rd the palace was forcibly occupied; and the pro-Chinese party being removed from power, the control of the Government passed into the hands of the Japanese. Meanwhile China had made efforts to reinforce the detachment at Asan, and had despatched about 8000 troops to the Yalu river. The outbreak of war thus found the Japanese in military possession of Seoul and ready to send large forces to Korea, while the Chinese occupied Asan (about 40 miles southward of the capital), and had a considerable body of troops in Manchuria in addition to those despatched to the Yalu river. To Japan the command of the sea was essential for the secure transport and supply of her troops. Without it the experience of the war of the 16th century would be repeated. China, on the other hand, could utilize overland routes to Korea; but difficulties and delays would necessarily be entailed. To both Powers the naval question was thus all-important.

War was not finally declared till 1st August, by which time collisions had occurred on sea and land. On 25th July Major-General Oshima, with about 2500 men, started for Asan and found the Chinese entrenched at Sung-hwan. The position was successfully attacked on the 29th, with a loss of about 90 killed and wounded; but Yeh, the Chinese commander, escaped with the greater part of his force, and reached Phyong-yang by a wide detour. Meanwhile the Japanese squadron was proceeding to Chemulpo, the cruisers *Akitsushima*, *Yoshino*, and *Naniwa* being sent on in advance. On the morning of 25th July these vessels met the *Tsi-yuen* and the *Kuang-yi* near Phung Island. An engagement occurred, in which the *Kuang-yi* was disabled and run ashore, the *Tsi-yuen* escaping to Wei-hai-wei, chased by the *Yoshino*. The Chinese vessels, hopelessly overmatched, seem to have been well fought. At this juncture the wooden despatch boat *Tsao-kiang* approached from the south-east, and was captured by the *Akitsushima*, while the British steamer *Kowshing*, carrying 1200 Chinese troops from Taku to Asan, also arrived, and was ordered by the *Naniwa* to bring-to and anchor.

**Kowshing incident.**

The *Kowshing* having been directed to follow the *Naniwa*, the Chinese threatened to kill the officers if they complied or attempted to leave the ship. The *Naniwa* then opened fire and sank the *Kowshing* in less than half an hour. More than 1000 of the Chinese troops were drowned. The destruction of the *Kowshing* undoubtedly contributed to the Japanese success at Sung-hwan, and the intention of the Chinese to crush their enemies at Seoul between forces moving from the north and south was frustrated. Henceforth the Japanese had to deal only with the forces north of the capital.

It was now of vital importance to the Chinese to prevent the transport of Japanese troops to Chemulpo, which was carried on with the greatest energy. The Chinese fleet, however, remained in port, and the Japanese made no attempt to obtain and keep touch with it. During August and September the Japanese were busied in landing troops and stores at Chemulpo and Gensan, while the Chinese forces in Manchuria moved slowly to the Yalu river. On 8th August the Japanese began to move northwards. By 12th September about 14,000 men had converged upon Phyong-yang in three columns from Gensan, Sak-riong, and Chung-hua, and the main body under Lieutenant-General Nodzu from Huang-ju. A general attack was made on 15th September, and the strongly entrenched position was captured, with a loss of about 650 killed and wounded. The Chinese, numbering about 12,000, suffered heavily, and retreated northwards over the river Yalu. Korea being thus cleared, the war entered upon another phase.

**Yalu battle.**

Two days after the capture of Phyong-yang the hostile fleets came in contact. Admiral Ito seems to have taken no direct measures to prevent the landing of troops in the Yalu, and five Chinese transports left Taku on 14th September with a cruiser escort, picking up the Pei-yang squadron, under Admiral Ting, *en route*. About 4000 men were disembarked on the 16th, and the Chinese warships weighed early on the 17th for the return voyage. They were sighted at about half-past eleven in the forenoon by the Japanese squadron, which was reconnoitring in the neighbourhood of the island of Hai-yang.

The tables on the following page give a detail of the fleets, which were not unevenly matched, the Japanese having the advantages of more modern ships, quick-firing guns, speed, and homogeneity, while the Chinese fleet contained two second-class battleships, the *Ting-Yuen* and the *Chen-Yuen*.

Admiral Ting attempted to form his force in quarter-line abreast, but the evolution was not accomplished, and the Chinese fleet bore down in a somewhat irregular line, the two battleships being in the centre and the weakest vessels—the *Chao-Yung* and the *Yang-Wei*—on the wings. Admiral Ito divided his squadron into two parts, which were separately handled throughout the action, moving always in single column line ahead. The flying squadron, consisting of the fast vessels *Yoshino*, *Naniwa*, *Takachiho*, and *Akitsushima*, was ordered to pass round the Chinese right wing and attack the rear. In place of turning to starboard as intended, the squadron bore away to attack two detached Chinese vessels, which with some torpedo boats appeared to be

*Chinese Squadron.*

2 Aft in *Matsushima;* forward in her two sister-ships.

attempting to join the fleet. Meanwhile the main squadron, led by the flagship *Matsushima*, followed, and circling round the Chinese line passed its left wing. The flying squadron, recalled by signal, again engaged the right wing. The courses became somewhat complicated; but, broadly speaking, the two Japanese squadrons continued to steam independently round the Chinese vessels, concentrating their fire upon individual groups. On the other hand, the Chinese almost from the first lost all order and attempted no manœuvring; but the two battleships *Ting-Yuen* and *Chen-Yuen* supported each other, and their armour proved a match for the Japanese ordnance, which was unable to disable them. Before sunset the *Yang-Wei*, *Chao-Yung*, *King-Yuen*, and *Chi-Yuen* had been sunk by shells, and the *Matsushima* and *Hi-Yei* were much damaged. The crews of both fleets were much exhausted. The Japanese pursuit seems to have been half-hearted, and contact was lost during the night. The total Japanese loss amounted to 115 killed and 103 wounded, of which nearly half occurred on board the *Matsushima*. The Chinese lost about 600 men in the sunken ships, in addition to about 100 killed and between 200 and 300 wounded. The action was decided solely by gun fire, although the Chinese discharged two torpedoes against the armed transport *Sakio-Maru* without effect. The result of the action was to confer upon the Japanese the full command of the sea, and to enable them to prosecute the land campaign without hindrance. The surviving Chinese ships, with the exception of one which went aground near Ta-lien-wan and was destroyed, reached Port Arthur, and subsequently steamed to Wei-hai-wei.

The Japanese now determined to invade Manchuria with the army under Marshal Yamagata, and to embark a second army, consisting of the 1st division and a brigade of the 6th division with siege artillery, under Marshal Oyama, for the capture of Port Arthur, and subsequently to move up the Liao-Tung peninsula and join hands with the northern force. The Japanese crossed the Yalu on 24th and 25th of October, meeting little resistance, and successfully occupied Antung, Chin-lien-cheng, and Feng-huang. Thence on the 9th November General Tachimi, with the 5th division, advanced along the road to Mukden, and reconnoitred the Mo-tien-ling Pass on the 12th, while the 3rd division under General Oseko, operating to the south, occupied Ta-tung-kau on the 5th. By a combined attack of General Oseko's force and a battalion of infantry under Colonel Mihara moving from Fung-huang, Hsin-yen, on the route to Hai-cheng, was taken on the 18th. Leaving a garrison at Hsin-yen, General Oseko's main force returned to Ta-ku-shan. A pause in the general advance of the first army now occurred, and holding their advanced positions, the Japanese explored the country by means of reconnoitring parties.

**Port Arthur.**

The detached brigade of the second army disembarked on 24th October about 38 miles to the north-east of Ta-lien-wan, and its advanced guard occupied Pi-tzu-wo on the following day. The landing of the whole force, with its horses and stores, required twelve days. On 6th November the important town of Chin-chau was attacked and taken, and on the 7th Ta-lien-wan, with its three modern coast forts, was occupied without resistance, the fleet arriving in the bay on the same day. The Japanese were now in possession of a good harbour, where their siege train could be landed, 10 miles from Port

Arthur. Here the Chinese possessed a strongly fortified position held by about 9000 men. The attack was delivered on 21st November after a bombardment of the forts by 36 siege and 60 field and mountain guns. The resistance was contemptible, and Port Arthur was captured with a loss of only 270 killed and wounded.

Meanwhile in Manchuria the Chinese assumed the offensive. On 25th November the Japanese outpost at Tsao-ho-kau, 5 miles from the Mo-tien-ling Pass, was attacked in force. The attack was repulsed, and a flying column under Colonel Tachimi, leaving Fung-huang on the following day, reached Tsao-ho-kau by a mountain road, defeating a Chinese force in the neighbourhood. The difficulties of supplying an advanced party, which was now confronted by superior forces, caused the Japanese to withdraw from Tsao-ho-kau, and to concentrate nearer Fung-huang, towards which the Chinese moved in three columns. On 14th December the Chinese were defeated. Meanwhile on 10th December the 3rd division began its advance from Hsin-yen upon Hai-cheng, which was taken on the 13th. The Japanese now occupied a somewhat exposed position, threatened by considerable Chinese forces at Ying-kau and Liao-Yang. General Sung, advancing from the former with about 9000 men, was attacked and defeated on 19th December; but the Japanese, who had about 4500 men present, lost nearly 400, the Chinese offering a comparatively stubborn resistance. On 17th January the Liao-Yang force, estimated at 14,000 strong, appeared in front of Hai-cheng and opened an ineffective long-range fire, dispersing in disorder when the Japanese advanced against them. A similarly futile attack was made on 22nd January, the Japanese loss being trifling.

The advance of the second army northward was long delayed by difficulties of transport, aggravated by the rigours of the climate. At length, on 1st January, a brigade of infantry and a regiment of cavalry, with three batteries of artillery, started from Chin-chau under General Nogi and attacked a Chinese force strongly posted at Kai-ping on the 10th. The position was carried after three hours' fighting, with a loss of more than 300 killed and wounded, the Chinese showing some steadiness. Communication with the force occupying Hai-cheng was at once established.

The situation in Manchuria being thus secured, the Japanese proceeded to attack Wei-hai-wei, where lay the surviving vessels of the Pei-yang squadron. On 18th January a naval demonstration was made at Teng-chau, 70 miles west of Wei-hai-wei, and on the 19th the Japanese began their disembarkation at Yung-cheng Bay, about 12 miles from Wei-hai-wei. The force employed consisted of the 2nd division, newly mobilized, and a brigade from the second army, under Marshal Oyama. The Chinese made no attempt to oppose the landing, and on the 26th the troops advanced. The eastern forts were captured on the 30th, the only effective opposition being that offered by the Chinese ships, which, steaming near to the land, inflicted some loss upon the Japanese. The guns in the western defences were disabled by a landing party on 1st February, and these defences were occupied by the Japanese on the following day. On the night of 4th February the Chinese squadron in harbour was attacked by ten torpedo boats. Two boats were lost, but the armour-clad *Ting-Yuen* was sunk. On the following night a second attack was made by four boats, and the *Wei-Yuen*, *Lai-Yuen*, and a gunboat were sunk. On 9th February the *Ching-Yuen* was sunk by the guns in one of the eastern forts manned by Japanese sailors. It was now seen that the remaining vessels were at the mercy of the Japanese, and on the 12th Admiral Ting wrote to Admiral Ito offering to surrender, and then took poison, other officers following his example. On the 16th the Japanese occupied Lien-kung island, and the remnant of the Chinese squadron passed into their hands.

***Wei-hai-wei.***

While the Wei-hai-wei campaign was in progress the Chinese despatched a great peace mission to Japan, which arrived at Hiroshima on 31st January with credentials which were pronounced by Count Ito to be "fatally defective." The original draft made by the United States minister at Peking had been replaced by another of Chinese composition, and the idea of the Tsung-Li-Yamen seems to have been to ascertain the views of the Japanese Government without themselves being committed. The Japanese declined to treat in these circumstances, and the mission returned to China.

In February the Chinese made two feeble attacks on Hai-cheng which were easily repulsed, and the Japanese at Kai-ping having been reinforced, advanced along the coast road, and after occupying Tai-ping-shan dislodged a considerable Chinese force under General Sung from an entrenched position. The Chinese were now concentrated in three groups at Ying-kau, New-chwang, and Liao-Yang; and General Katsura at Hai-cheng having been reinforced, advanced on 28th February with the 3rd division, and captured New-chwang on 4th March. The Chinese suffered heavy loss. Two days later, Marshal Yamagi with the western column moved towards Ying-kau, which was occupied on 7th March, General Sung retreating across the Liao river. The Japanese forces at Ying-kau and New-chwang now combined in attacking Tien-chwang-tai, which was taken on 9th March.

The Chinese forces in Manchuria being thoroughly broken and dispersed, there was nothing to prevent the Japanese from proceeding to the occupation of Peking, since the melting of the ice which forms along the northern shores of the Gulf of Pe-chi-li would permit them to land and supply large forces at Shan-hai-kwan, within 170 miles of the capital. Negotiations were therefore opened, and Li Hung-Chang proceeded to Shimonoseki, where a treaty was signed on 17th April. The terms included the "full and complete independence and autonomy of Korea," and the cession of the southern portion of the province of Shin-king (with a frontier extending from the Yalu river to Ying-kau), of Formosa and adjacent islands, and of the Pescadores group. Article IV. fixed an indemnity of 200 millions of taels. By Article VI. four additional cities and ports were opened to Japanese trade, and rights of navigation on Chinese rivers were extended. Wei-hai-wei was to be occupied as a guarantee of performance. The cession of territory in the province of Shin-king was subsequently cancelled by the joint action of Russia, France, and Germany.

The China-Japan war presents little interest from the military point of view. The proved excellence of the Japanese organization was, however, a revelation. The operations were carried through to complete success in a most difficult country during all the severity of a northern winter. The Japanese commanders were not only able to move and supply their troops, but they showed exact knowledge of the liberties which could be taken in face of Chinese forces. No European army could have accomplished so much in so short a time. In all that relates to the despatch of troops over-sea the Japanese organization fulfilled every requirement. Their navy showed itself to be a formidable weapon of war, well capable of holding its own among the fleets of the world. Politically the main results of the war were two: 1st, the raising of Japan to the position of a great naval and military power; and, 2nd, the hastening by some years of the accomplishment of the plans of Russia for the absorption of Manchuria and the Liao-Tung peninsula. (G. S. C.)

**Chinandega,** or CHINENDEGA, capital of a department of the same name in the republic of Nicaragua, Central America, situated on the Managua railway, 18 miles N.W. of Leon and 12 E. of Corinto. It has considerable trade in cotton and sugar, and is surrounded by banana plantations. In 1849 it was the temporary capital of the three united republics of Nicaragua, Honduras, and Salvador. Population, about 12,000.

**Chindwin.**—This river, like the Irrawaddy, of which it is the largest tributary, has its entire course in Burmese territory. It is called Ningthi by the Manipuris. The Chindwin is formed by the junction of the Tanai, the Tawan, and the Tarôn or Turông, but it is still uncertain which is the main stream. The Tanai has hitherto been looked on as the chief source. It rises in about 25° 30′ N. lat. and 97° E. long., on the Shwedaung-gyi peak of the Kumôn range, 12 miles N. of Mogaung, and flows due north for the first part of its course until it reaches the Hukawng valley, when it turns to the west and flows through the middle of the plain to the end of the valley proper. There it curves round to the south, passes through the Tarôn or Turông valley, takes the name of the Chindwin, and maintains a general southerly course until it enters the Irrawaddy, after flowing through the entire length of the Upper and Lower Chindwin districts, in about 21° 30′ N. lat. and 95° 15′ E. long. Its extreme outlets are 22 miles apart, the interval forming a succession of long, low, partially populated islands. The most southerly mouth of the Chindwin is, according to tradition, an artificial channel, cut by one of the kings of Pagān. It was choked up for many centuries until in 1824 it was opened out by an exceptional flood. The Tanai (it is frequently called Tanaikha, but *kha* is merely the Kachin

word for river), as long as it retains that name, is a swift, clear river, from 50 to 300 yards wide and from 3 to 15 feet deep. In the Hukawng valley it has steep banks, fringed to a depth of a mile or more inland with wild plantain-trees. The river is navigated by native boats in the Hukawng valley, but launches cannot come up from the Chindwin proper because of the reefs below Taro. The earlier tributaries are on the right bank; they are the Tabye, the Tawan, and the Turông or Tarôn. The Tawan, at its junction with the Tanai, close to the Mashi ferry, measures about 400 yards from bank to bank, and the breadth of the actual stream in the dry weather is 150 yards. It probably flows from the range which forms the south-west boundary of Hkamti Lông, whose peaks are snow-covered during the dry season. The Tarôn, Turông, or Towang river seems to be the real main source of the Chindwin. It flows into the Hukawng valley from the north, and has a swift current with a succession of rapids. At Ningpyen it is 300 to 400 yards wide, and has well-defined banks. Its sources are in the hills to the south of Sadiya, rising from 10,000 to 11,000 feet above sea-level. For the first portion of its course the river flows through a deep valley, with a general east and west direction, as far as its junction with the Loglai. It then turns south, and after draining an intricate system of hills, breaks into the Hukawng valley a few miles to the north of Saraw, and joins or receives the Tanai about 10 miles above Kintaw village. Except the Tanai, the chief branches of the Upper Chindwin rise in mountains that are covered at least with winter snows. Below the Hukawng valley the Chindwin is interrupted at several places by falls or transverse reefs. At the village of Haksa there is a fall, which necessitates transhipment from the large boats which ply below to canoes. Not far below this the Uyu river comes in on the left bank at Homalin, and from this point downwards the steamers of the Irrawaddy Flotilla Company ply for the greater part of the year. The Uyu flows through a fertile and well-cultivated valley, and during the rainy season it is navigable for a distance of 150 miles from its mouth by steamers of light draught. Ordinarily regular steam communication with Homalin ceases in the dry weather, but from Kindat, nearly 150 miles below it, there are regular weekly steamers all the year round. Below Kindat the only considerable affluent of the Chindwin is the Myit-tha, which receives the Chin hills drainage. As far as Mingin the general course of the Chindwin is south-westerly; below that town it curves eastwards towards the Irrawaddy. The Chindwin rises very considerably during the rains, but in March and April it is here and there so shallow as to make navigation difficult even for small steam launches. Whirlpools and narrows and shifting sandbanks also give some trouble, but much has been done to improve navigation since the British annexation. (J. G. Sc.)

**Chindwin,** Upper and Lower, two districts in the Sagaing division of Upper Burma. Upper Chindwin has an area of 19,062 square miles, and a population, according to the census of 1891, of 111,533, living in 980 villages, and paying in 1898-99 a revenue of Rs.3,22,057. Lower Chindwin has an area of 3481 square miles, and a population of 233,316 living in 893 villages, and paying in 1898-99 a revenue of Rs.5,53,982. Upper Chindwin lies to the north of the lower district, and is bounded on the N. by the Chin Naga and Kachin hills; on the E. they are bounded by the Myit Kyina, Katha, and Shwebo districts; Lower Chindwin is bounded on the S. by the Pakôkku and Sagaing districts; and both districts are bounded on the W. by the Chin hills, and by Pakôkku on the southern stretch. The chief flat country is along the banks of the Chindwin river, which runs through the centre of both districts, and the plain to the east of the river in Lower Chindwin is very extensive and fertile. The western portion of both districts is hilly, and the greater part of Upper Chindwin is of the same character. In Upper Chindwin, out of 12,199,680 acres, only 112,388 were cultivated in 1899; in Lower Chindwin 296,326 acres out of a total of 2,227,584. In Upper Chindwin 1,640,823 acres more were available, and 541,085 acres in the lower district. Both have valuable teak forests. The area of forest land in Lower Chindwin is 301,440 acres, and in the upper district 1,085,120 acres. The area of reserved forest is yearly being extended. In 1898 there were 471 square miles of reserved tracts in Lower Chindwin. The total rainfall in 1898-99 was in Lower Chindwin 27·96 inches, and in Upper Chindwin 60·94. Both registered a highest temperature in May of 106° F., and the lowest reading in December was 54° at Mônywa, and 52° at Kinday in Upper Chindwin. In Lower Chindwin the population was made up of 232,158 Buddhists and Jains, 426 Mahommedans, 374 Hindus, 320 Chins and other hill races, and 38 Christians. In Upper Chindwin there were 108,816 Buddhists and Jains, 1112 Hindus, 1048 Chins and other hill races, 481 Mahommedans, and 76 Christians. Coal exists in extensive fields, but these are not very accessible. Rice forms the great crop, but a certain amount of til-seed and of indigo is also cultivated. Kinday, with a population of 2423, is the headquarters of the upper district, and Mônywa, with a population of 6316, of the lower. Both are on the Chindwin river, and are served by the steamers of the Irrawaddy Flotilla Company. Alôn, close to Mônywa, and formerly the headquarters, is the terminus of the railway from Sagaing westwards, which was opened in 1900. (J. G. Sc.)

**Chingleput,** or Chengalpat, a town and district of British India, in the Madras Presidency. The town, situated 36 miles by rail from Madras, had a population in 1881 of 5617; in 1891 of 9763. It has two high schools. The district of Chingleput surrounds the city of Madras, stretching along the coast for about 115 miles. The administrative headquarters are at Saidapet. It contains an area of 2842 square miles and a population in 1891 of 1,136,928, being 400 persons per square mile. In 1901 the population was 1,312,722, showing an increase of 9 per cent. The land revenue and rates were Rs.20,07,908, the incidence of assessment being Rs.2:2:6 per acre; the number of police was 735. In 1897-98, out of a total cultivated area of 659,898 acres, 419,298 were irrigated. Salt is extensively manufactured all along the coast. Cotton-weaving is also largely carried on. There are 574 indigo vats, with an out-turn valued at Rs.2,00,000; 83 tanneries, with an out-turn valued at Rs.29,00,000; and an English cigar factory. In 1896-97 the number of schools was 1047, attended by 29,291 pupils.

**Chinkiang,** or Chin-Keang-fu, a treaty port in China, situated on the river Yangtse above Shanghai, from which it is distant 160 miles. It is a place of considerable importance as a distributing centre, but has no direct trade with foreign countries. It lies at the point where the Grand Canal running north and south intersects the Yangtse, which runs east and west, and thus is peculiarly well situated to be a commercial entrepôt. Its trade, however, lies mainly with the north bank, where the Grand Canal is navigable for vessels drawing 8 to 10 feet of water. On the south bank the canal has been allowed to silt up so as to be impassable during the winter months. Railway communication with Shanghai on the one hand and with Nanking on the other will no doubt improve its prospects. Chinkiang is also the proposed terminus of the

Anglo-German railway to be built from Tientsin southwards through Shantung. The total value of exports and imports for 1899 was H. taels 25,691,000 (£3,854,000). In 1880 the total was H. taels 14,297,000 (£3,932,000). Chinkiang was the seat of a serious riot on the 5th February 1898, when the British consulate and several foreign houses were burned down by a native mob. The population is estimated at 240,000. The number of foreign residents is very small, the trade being almost entirely in the hands of natives.

**Chippenham,** a municipal borough and market town in the Chippenham parliamentary division (since 1885) of Wiltshire, England, on the Avon, 13 miles N.E. of Bath by rail. Works for milk-condensing, bacon-curing, and making railway signals, guns, and carriages have been established. Area, 359 acres; population (1881), 4495; (1901), 5074.

**Chippewa Falls,** capital of Chippewa county, Wisconsin, U.S.A., situated in 44° 45′ N. lat. and 91° 23′ W. long., in the north-western part of the state, on the Chippewa river, at an altitude of 831 feet. It is at the intersection of three railways, and possesses a fine water-power, which has given rise to extensive manufactures, largely of lumber. Population (1880), 3982; (1890), 8670; (1900), 8094, of whom 2357 were foreign-born.

**Chishima,** the Japanese term (literally "a thousand islands") for the Kuriles (*q.v.*).

**Chitral.**—The state of Chitral (see also HINDU KUSH) is somewhat larger than Wales, and supports a population of between 70,000 and 80,000 rough, hardy hillmen. Both the state and its capital are called Chitral, the latter being situated about 47 miles from the main watershed of the range of the Hindu Kush, which divides the waters flowing down to India from those which take their way into the Oxus and on to Turkestan and Central Asia. Chitral is an important state because of its situation at the extremity of the country over which the Government of India exerts its influence, and for some years before 1895 it had been the object of the policy of the Government of India to control the external affairs of Chitral in a direction friendly to British interests, to secure an effective guardianship over its northern passes, and to keep watch over what goes on beyond these passes. This policy resulted in a British agency being established at Gilgit (Kashmir territory), with a subordinate agency in Chitral, the latter being usually stationed at Mastang (65 miles nearer to Gilgit than the Chitral capital), and occasional visits being paid to the capital.

In December 1894 Surgeon-Major Robertson, C.S.I. (India Medical Service)—afterwards Sir George Robertson, K.C.S.I.—the British agent, was at Gilgit; and his assistant, Lieutenant Gurdon, with ten men of his escort, was staying on a visit to the Chitral capital, the remainder of his escort of 100 men remaining at Mastang. On the 1st January 1895 the Mihtar (or Ruler) of Chitral was treacherously murdered at the secret instigation of Sher Afzul, who himself was an ex-Mihtar, and had been dethroned by a stronger party in the state and forced to fly for refuge to Cabul. His chief ally was Umra Khan, chieftain of Jhandol, whose restless ambition, not satisfied with numerous small conquests and increases of territory, had long been set on the Mihtarship of Chitral. For the time being, however, he posed as an ally of Sher Afzul; but without waiting for the latter's arrival from Cabul, he himself, on hearing of the Mihtar's murder, hastened with his forces to seize Chitral. He met with some success, capturing Killa Dresh, 25 miles to the south of Chitral Fort; but here he was opposed and beaten by the Chitralis themselves. At this juncture he was joined by Sher Afzul, who quickly won over the Chitralis; and the two forces amalgamated and made common cause against the British, whose presence at Chitral was considered likely to interfere with the return of Sher Afzul to the throne. The combined force at once marched to attack Chitral Fort.

On hearing of the Mihtar's assassination, Lieutenant Gurdon at Chitral immediately informed Dr Robertson at Gilgit, and with great discretion avoided all collision with the new Mihtar (the assassin Amir-ul-Mulk). Gurdon was soon reinforced by 50 men from his headquarters at Mastang, and on the 1st February Dr Robertson himself arrived from Gilgit and assumed political charge. The situation remained unchanged until Umra Khan, marching on Chitral, captured Killa Dresh; and on Sher Afzul joining him, a joint letter was sent to Dr Robertson, ordering his immediate withdrawal to Mastang. The demand was ignored, and in their turn the Government of India ordered Umra Khan to withdraw to his own territory. As he refused, the Government of India prepared for war; and, abandoning the route through Gilgit and over the snow-bound passes as impracticable, they decided on an advance from Nowshera (British India), less than 200 miles from Chitral, through Swat and Jhandol (Umra Khan's state). Major-General Sir R. Low was selected to command this relieving force, and on the 1st April an army of some 15,000 men was concentrated beyond Nowshera at Hoti-Mardan on the frontier. On 3rd April Sir R. Low stormed the Malakand Pass, and won a decisive victory over the Swatis, who had been induced by Umra Khan to oppose the British. The position was considered impregnable by the enemy, but was carried with great gallantry. After this victory the force pushed on into Swat, and a few days later crossed the Swat river in the teeth of a stubborn resistance and continued the forward march.

Dr Robertson, on arrival at Chitral, determined to try to open up communication with Gilgit and Mastang. Accordingly, he despatched Lieutenants Fowler and Edwardes with a small party for this purpose. After two marches they were attacked by the enemy, but managed to send word on to Mastang. A Mastang party under Captain Ross advanced to relieve them, but was in its turn attacked by overwhelming numbers, and eventually had to cut its way back, losing Captain Ross and 54 men killed. Fowler and Edwardes held out for a week with magnificent bravery, but eventually were, through treachery, overwhelmed and captured. Mastang itself was now besieged, and Chitral completely cut off. The garrison of the former place made a gallant defence, and were able to hold out until relieved by Colonel Kelly, whose march will be presently described

Sir R. Low's force had pushed forward to the Paingkua river, and on the 13th April Lieutenant Edwardes was released by Umra Khan and sent into the British camp. The same day a third successful battle was fought, and on the 16th the force crossed the river, finally defeated the enemy, and pushed on towards Chitral. A few days later Lieutenant Fowler also was sent in by Umra Khan, who had brought these officers down with him from Chitral, and hoped by releasing them to prevent the invasion of his country. But this was not General Low's view of the matter, and on the 18th inst. his force occupied Umra Khan's deserted stronghold in Jhandol, the latter fleeing with his family and treasure towards Cabul. He was not overtaken, and remained at Cabul a refugee.

Meantime the siege of Chitral had begun, and was being prosecuted with the utmost vigour by Sher Afzul, Umra Khan having proceeded south to oppose Sir R. Low. The defence of Chitral will always be counted among the finest exhibitions of British pluck. The garrison numbered only 543, of whom 137 were non-combatants. On the first day of the siege a reconnaissance by the garrison was repulsed with heavy loss, Captain Baird and 24 men being killed. This engagement was the hardest fought during the whole war. The military command was in the hands of Captain Townshend, to whose skill, energy, and valour the successful resistance of the garrison was practically due; Dr Robertson, though ranking himself as a non-combatant, assisting most gallantly in the perilous duties of the defence, in the performance of which he was severely wounded. The siege lasted 46 days. One of its most brilliant features was a sortie by Lieutenant Harley to destroy the besiegers' mines on the 17th April.

The relief of Chitral was at last accomplished by Colonel Kelly. This officer, with his regiment, the 32nd Pioneers, was at this time employed at road-making in the Gilgit district. On the 22nd March (the siege of Chitral having begun on the 4th) Colonel Kelly was ordered by the Government of India to assume military command of all the troops under the Gilgit agency. He was made acquainted with what had taken place at Chitral, and was given practically a free hand to make such dispositions and movements of the troops under his command as he considered necessary. He immediately decided to march over the snow passes on a relief expedition, in spite of the fact that this route had been considered impracticable by the Government of India and the road through Swat, Jhandol, and Dir decided on. The troops at Colonel Kelly's disposal were entirely native troops, consisting of 400 men of the 32nd Pioneers, with 2 mountain guns, 40 sappers and miners, and some 150 ragged and undisciplined levies from the wilds of surrounding native states. With this small force he had to march through 220 miles of hostile country yielding scarcely any supplies; and above all, he had to cross the terrible Shandur Pass, 12,230 feet high, at this time covered with deep snow. In the face of all

these difficulties Colonel Kelly set out on the 23rd March, the day after receiving his orders. Marching rapidly, the little force successfully crossed the Shandur Pass on the 28th March. On the 9th April Colonel Kelly fought and defeated the Chitralis, and on the same day relieved the garrison of Mastang. On the 13th April Colonel Kelly again fought a successful action at Nisa Gol. The enemy having now been dispersed, the road to Chitral was left clear, and on the 20th April the gallant little force relieved Chitral Fort without opposition from Sher Afzul and his followers, who had fled during the previous night. General Low's army was then at Umra Khan's stronghold, and no news arriving of the relief by Colonel Kelly, one lightly-equipped brigade under General Gatacre was pushed on towards Chitral. On 1st May they crossed the Lewarai Pass (10,000 feet high) over deep snow. Here they halted, as all opposition was over. Colonel Kelly's force soon returned to Gilgit, but Sir Robert Low's troops held the line from Nowshera to Chitral for six months while the future policy was being arranged. At one time during the occupation the force had actually received orders to evacuate the whole country; but before this was commenced a change of Government occurred in England, and the new Cabinet immediately reversed the orders of their predecessors. Eventually the force was withdrawn during September and October 1895, a brigade being left at Killa Dresh. This was to be relieved every two years. The Khan of Dir (to whom were returned the lands seized by Umra Khan) and the Khan of Nawayai were subsidized to keep the road in repair and to ensure the safety of the biennial reliefs to and from Killa Dresh. Umra Khan was not permitted to return to his country. Sher Afzul, finding resistance hopeless, surrendered with his force. He and twenty of his chief men, with the assassin Amir-ul-Mulk, were sent to India to remain perpetually domiciled at Dharmsala, a hill-station in the Himalayas. (C. J. B.)

**Chittagong,** a seaport of British India, giving its name to a district and a division of Bengal. It is situated on the right bank of the Karnaphuli river, about 12 miles from its mouth. It is the terminus of the Assam-Bengal railway. The municipal area covers about 9 square miles; population (1881), 20,969; (1891), 24,069. Chittagong is the second seaport of Bengal. In 1897-98 the sea-borne exports were valued at Rs.1,12,63,036, of which more than half was jute, other items being tea, raw cotton, rice, and hides. There is also a large trade by country boats, which brought imports in 1897-98 valued at Rs.33,87,915, chiefly cotton, rice, spices, sugar, and tobacco. There is one rice-husking mill, employing 65 persons, with an out-turn valued at Rs.1,50,000. There are a Government college, a law class, a high school, and two Roman Catholic convent schools. Two of the five printing-presses issue vernacular newspapers.

The district of CHITTAGONG is situated at the north-east corner of Bengal, occupying a strip of coast and hills between the sea and the mountains of Burma. Its area (excluding the Chittagong Hill Tracts) is 2563 square miles. The population in 1891 was 1,290,167, giving an average density of 503 persons per square mile. Classified according to religion, Hindus numbered 302,333; Mahommedans, 924,849; Buddhists (from Arakan), 61,615; Christians, 1191, of whom 256 were Europeans; "others," 179. In 1901 the population was 1,352,722, showing an increase of 5 per cent. The land revenue and rates are Rs.10,16,834; the number of police is 497; the death-rate in 1897 was 49·46. This high mortality was partly due to the destructive cyclone of October. In 1896-97 the number of boys at school was 56,593, being 62 per cent. of the male population of school-going age. The northern portion of the district is traversed by the Assam-Bengal railway. Tea cultivation is moderately successful. In 1897-98 there were 23 gardens, with 4025 acres under tea, employing permanently 3556 persons and producing more than two million lb. The Chittagong forests yielded in 1897-98 a gross revenue of Rs.77,406.

The CHITTAGONG HILL TRACTS, formerly an independent district, have been reduced to the status of a subdivision. They occupy the ranges between Chittagong proper and the south Lushai hills. The area covers 5419 square miles. In 1891 the population was 107,286, giving an average density of 20 persons per square mile. In 1901 the population was 124,851, showing an increase of 16 per cent. The inhabitants, who are either Arakanese or aboriginal tribes, are almost all Buddhists. The headquarters are at Rangamati (population, 2336), which was entirely wrecked by the cyclone of October 1897. There is one tea garden with 100 acres under tea, employing 120 persons and producing 27,000 lb.

The division of CHITTAGONG lies at the north-east corner of the Bay of Bengal, extending northward along the left bank of the Meghna. It consists of the three districts of Chittagong (including the Hill Tracts), Noakhali, and Tipperah. Its area covers 12,118 square miles; the population in 1891 was 4,190,081, giving an average density of 345 persons per square mile.

**Chittore,** a town of British India, in the North Arcot district of Madras, situated in 13° 13′ N. lat. and 79° 8′ E. long.; station on the South Indian railway. Population (1881), 5809; (1891), 9965. Formerly a military cantonment, it is now only the civil headquarters of the district. It has an English church, mission chapel, and Roman Catholic chapel, a high school, two printing-presses, and several literary institutes.

**Chitty, Sir Joseph William** (1828-1899), English judge, was born in London in 1828. He was the second son of Mr Thomas Chitty (himself son and brother of well-known lawyers), a celebrated special pleader and writer of legal text-books, in whose pupil-room Earl Cairns, Lord O'Hagan, Chief Justice Whiteside, Mr Justice Willes, Mr Justice Quain, Sir James Hannen, and many other distinguished lawyers began their legal education. Joseph Chitty was educated at Eton and Balliol, Oxford, gaining a first-class in 1851, in the old honour school of *Literæ Humaniores*, and being afterwards elected to a fellowship at Exeter College. His principal distinctions during his school and college career had been earned in athletics, and he came to London as a man who had stroked the Oxford boat and captained the Oxford cricket eleven, besides bearing a well-known legal name and being possessed of first-class abilities. In these circumstances he had little difficulty in making his mark. He became a member of Lincoln's Inn in 1851, was called to the bar in 1856, and made a queen's counsel in 1874, electing to practise as such in the court in which Sir George Jessel, Master of the Rolls, presided. Chitty was highly successful in his method of dealing with a very masterful if exceedingly able judge, and soon gained the reputation of having the ear of the court to such an extent that his practice became very large, his fees being stated to have amounted at one time to £13,000 a year, a large sum for one not a law officer of the Crown. In 1880 he entered the House of Commons, being returned as Liberal member for Oxford (city) at the general election of that year. His parliamentary career was short, for in 1881 the Judicature Act required that the Master of the Rolls should cease to sit regularly as a judge of first instance, and Chitty was selected to fill the vacancy thus created in the Chancery division. It was remarked that two other judges during the century, Lord Hatherley and Sir William Erle, had represented Oxford in Parliament. Sir Joseph Chitty was for sixteen years a popular judge, in the best meaning of the phrase, being noted for his courtesy, geniality, patience, and scrupulous fairness, as well as for his legal attainments, and being much respected and liked by those practising before him, in spite of a habit of interrupting counsel, possibly acquired through the example of Sir George Jessel—a habit which in the case of Mr Justice Chitty did not accelerate the despatch of business as it did with his predecessor, but which no doubt was inspired, as a rule, by his desire to appreciate every detail of the case before him. His ready ejaculation "*Fiat justitia ruat cœlum,*" when a piece of the ceiling of his court fell while he was on the bench, is deserving of record. He remained a puisne judge until 1897, when, on the retirement of Sir Edward Kay, L.J., he was promoted to the Court of Appeal. There he more than sustained—in fact, he appreciably increased—his reputation as a lawyer and a judge, proving himself to possess considerable knowledge of the common law as well as of equity, during the short time which elapsed before

his death. He died in London on 15th February 1899, after a very short illness, originating in an attack of the prevailing epidemic of influenza.

Many legal contemporaries of Sir Joseph Chitty had been distinguished athletes while young. Lord Esher, M.R., Lord Justice A. L. Smith, Mr Justice Denman, and Lord Macnaghten may be mentioned as instances of university oars who were on the bench while he was a judge, while Sir Richard Webster (afterwards Lord Alverstone, L.C.J.) and Sir R. T. Reid, both law officers of the Crown, had been "blues" for running and cricket respectively. During four seasons Chitty kept wicket for the Eton eleven, of which he was captain in 1847 (he was afterwards held to be the best amateur wicket-keeper in England), and in those four years Eton won seven matches out of the eight played against Harrow and Winchester. At Oxford he played at cricket against Cambridge in 1848 and 1849, and won still greater fame on the river. He rowed 2 in the Oxford eight in the inter-university boat-race of March 1849, and 4 in the second of the two races rowed in that year. No inter-university race as such took place in 1850 or 1851, but in the latter year Oxford with Chitty stroke won the Grand Challenge Cup at Henley, Cambridge being a competitor; and in 1852 the inter-university race was again held, and Chitty stroked a strong Oxford crew to victory. In after life he acted as umpire in the inter-university boat-race for twenty-four years, ceasing to do so in 1881, and he was an active member of the Inns of Court Rifle Volunteers (the Devil's Own), holding a major's commission from 1869 to 1877, having been one of those who organized it in 1860, and having then been given a commission as a captain. In a profession largely filled by university men such a record was not likely to be forgotten. Sir Joseph Chitty married in 1858 Clara Jessie, daughter of Chief Baron Pollock, and left children who can thus claim descent from two of the best-known legal families of the 19th century.

**Choisy-le-Roi,** a town in the arrondissement of Sceaux, department of Seine, France, 4 miles in direct line S.E. of Paris, on the left bank of the Seine and on the railway to Orleans. A monument was erected in 1882 to Rouget de l'Isle, author of the "Marseillaise," who died here 1836. It has manufactures of cloth, felt, gloves, earthenware, porcelain, and glass, and considerable river trade. Population (1881), 6700; (1901), 11,287.

**Cholera.**—Much light has been thrown upon Asiatic cholera since 1880. Western experience has been enlarged by several epidemic outbreaks in different countries, and by one pandemic visitation of great violence; and the study of the disease by modern methods has resulted in important additions to our previous knowledge of its nature, causation, mode of dissemination, and prevention.

*Causation.*

The cause is a micro-organism identified by Koch in 1883. An account of it will be found under PATHOLOGY (*Parasitic Diseases*). For some years it was called the "comma bacillus," from its supposed resemblance in shape to a comma, but it was subsequently found to be a vibrio or spirillum, not a bacillus. The discovery was received with much scepticism in some quarters, and the claim of Koch's vibrio to be the true cause of cholera was long disputed, but is now universally acknowledged. Few micro-organisms have been more elaborately investigated, but very little is known of its natural history, and its epidemiological behaviour is still surrounded by obscurity. At an important discussion on the subject, held at the International Hygienic Congress in 1894, Professor Gruber of Vienna declared that the deeper investigators went the more difficult the problem became, while M. Metschnikoff of the Pasteur Institute made a similar admission. The difficulty lies chiefly in the variable characters assumed by the organism and the variable effects produced by it. The type reached by cultivation through a few generations may differ so widely from the original in appearance and behaviour as to be hardly recognizable, while, on the other hand, of two organisms apparently indistinguishable one may be innocuous and the other give rise to the most violent cholera. This variability offers a possible explanation of the frequent failure to trace the origin of epidemic outbreaks in isolated places. It is commonly assumed that the micro-organism is of a specific character, and always introduced from without, when cholera appears in countries or places where it is not endemic. In some cases such introduction can be proved, and in others it can be inferred with a high degree of probability, but sometimes it is impossible to trace the origin to any possible channel of communication. A remarkable case of this kind occurred at the Nietleben Lunatic Asylum near Halle, in 1893, in the shape of a sudden, explosive, and isolated outbreak of true Asiatic cholera. It was entirely confined to the institution, and the peculiar circumstances enabled a very exact investigation to be made. The facts led Professor Arndt, of Greifswald, to propound a novel and interesting theory. No cholera existed in the surrounding district and no introduction could be traced, but for several months in the previous autumn diarrhœa had prevailed in the asylum. The sewage from the establishment was disposed of on a farm, and the effluent passed into the river Saale above the intake of the water-supply for the asylum. Thus a circulation of morbid material through the persons of the inmates was established. Dr Arndt's theory was that by virtue of this circulation cholera was gradually developed from previously existing intestinal disease of an allied but milder type. The outbreak occurred in winter, and coincided with the freezing of the filter-beds at the water-works. The theory is worth notice, because a similar relation between the drainage and the water-supply frequently exists in places severely attacked by cholera, and it has repeatedly been observed that the latter is preceded by the prevalence of a milder form of intestinal disease. The inference is not that cholera can be developed *de novo*, but that the type is unstable, and that a virulent form may be evolved under favourable conditions from another so mild as to be unrecognized, and consequently undetected in its origin or introduction. This is quite in keeping with the observed variability of the micro-organism, and with the trend of modern research with regard to the relations between other pathogenic germs and the multifarious gradations of type assumed by other zymotic diseases. The same thing has been suggested of diphtheria.

*Epidemicity.*

Cholera is endemic in the East over a wide area, ranging from Bombay to Southern China, but its chief home is British India. It principally affects the alluvial soil near the mouths of the great rivers, and more particularly the delta of the Ganges. Lower Bengal is pre-eminently the standing focus and centre of diffusion. In some years it is quiescent, though never absent; in others it becomes diffused, for reasons of which nothing is known, and its diffusive activity varies greatly from equally inscrutable causes. At irregular intervals this property becomes so heightened that the disease passes its natural boundaries and is carried east, north, and west, it may be to Europe or beyond to the American continent. We must assume

that the micro-organism, like those of other epidemic diseases, acquires greater vitality and toxic energy, or greater power of reproduction at some times than at others, but the conditions that govern this behaviour are quite unknown, though no problem has a more important bearing on public health. Bacteriology, as already intimated, has thrown no light upon it, nor has meteorology. Some results of modern research, indeed, tend to assign increasing importance to the relations between surface soil and certain micro-organisms, and suggest that changes in the level of the subsoil water, to which Pettenkofer long ago drew attention, may be a dominant factor in determining the latency or activity of pathogenic germs. But this is largely a matter of conjecture, and, so far as cholera is concerned, the conditions which turn an endemic into an epidemic diease must be admitted to be still unknown.

On the other hand, the mode of dissemination is now well understood. Diffusion takes place along the lines of human intercourse. The poison is carried chiefly by infected persons moving from place to place; but soiled clothes, rags, and other articles that have come into contact with persons suffering from the disease may be the means of conveyance to a distance. There is no reason to suppose that it is air-borne, or that atmospheric influences have anything to do with its spread, except in so far as meteorological conditions may be favourable to the growth and activity of the micro-organisms. Beyond all doubt, the great manufactory of the poison is the human body, and the discharges from it are the great source of contagion. They may infect the ground, the water, or the immediate surroundings of the patient, and so pass from hand to hand, the poison finding entrance into the bodies of the healthy by means of food and drink which have become contaminated in various ways. Flies which feed upon excreta and other foul matters may be carriers of contagion. Of all the means of local dissemination, contaminated water is by far the most important, because it affects the greatest number of people, and this is particularly the case in places which have a public water-supply. A single contaminated source may expose the entire population to danger. All severe outbreaks of an explosive character are due to this cause. It is also possible that the cholera poison multiplies rapidly in water under favourable conditions, and that a reservoir, for instance, may form a sort of forcing-bed. But it would be a mistake to regard cholera as purely a water-borne disease, even locally. It may infect the soil in localities which have a perfectly pure water-supply, but have defective drainage or no drainage at all, and then it will be found more difficult to get rid of, though less formidable in its effects, than when the water alone is the source of mischief. In all these respects it has a great affinity to enteric fever. With regard to locality, no situation can be said to be free from attack if the disease is introduced and the sanitary conditions are bad; but, speaking generally, low-lying places on alluvial soil near rivers are more liable than those standing high or on a rocky foundation. Of meteorological conditions it can only be said with certainty that a high temperature favours the development of cholera, though a low one does not prevent it. In temperate climates the summer months, and particularly August and September, are the season of its greatest activity.

***Western diffusion.***

Cholera spreads westwards from India by two routes—(1) by sea to the shores of the Red Sea, Egypt, and the Mediterranean; and (2) by land to Northern India and Afghanistan, thence to Persia and Central Asia, and so to Russia. In the great invasions of Europe during the 19th century it sometimes followed one route and sometimes the other. Four such invasions are mentioned in the article in the ninth edition of the *Encyclopædia*—those of 1830-39, 1847-49, 1853-54, and 1865-67—but by some writers the epidemic of 1853 is regarded as a recrudescence of that of 1847. The earlier ones followed the land route by way of Afghanistan and Persia, and took several years to reach Europe. That of 1865 travelled more rapidly, being carried from Bombay by sea to Mecca, from there to Suez and Alexandria, and then on to various Mediterranean ports. Within the year it had not only spread extensively in Europe, but had reached the West Indies. In 1866 it invaded England and the United States, but during the following year it died down in the West. The subsequent history of cholera in Europe may be stated chronologically.

1869-74.—This invasion was traced to the great gathering of pilgrims at Hardwar on the Upper Ganges in the month of April 1867. From there the returning pilgrims carried it to the Punjab, Cashmere, and Afghanistan, whence it spread to Persia and the Caspian, but it did not reach Russia until 1869. During the next four years a number of outbreaks occurred in Central Europe, and notably one at Munich in the winter of 1873. The irregular character of these epidemics suggests that they were rather survivals from the pandemic wave of 1867 than fresh importations, but there is no doubt that cholera was carried overland into Russia in the manner described.

1883-87.—This visitation, again, came by the Mediterranean. In 1883 a severe outbreak occurred in Egypt, causing a mortality of above 25,000. Its origin remained unknown. During this epidemic Koch discovered the comma bacillus. The following year cholera appeared at Toulon. It was said to have been brought in a troopship from Saigon in Cochin China, but it may have been connected with the Egyptian epidemic. A severe outbreak followed and reached Italy, nearly 8000 persons dying in Naples alone. In 1885 the south of France, Italy, Sicily, and Spain all suffered, especially the last, where nearly 120,000 deaths occurred. Portugal escaped, and the authorities there attributed their good fortune to the institution of a military cordon, in which they have had implicit confidence ever since. In 1886 the same countries suffered again, and also Austria-Hungary. From Italy the disease was carried to South America, and even travelled as far as Chile, where it had previously been unknown. In 1887 it still lingered in the Mediterranean, causing great mortality in Messina especially. According to Dr Wall, this epidemic cost 250,000 lives in Europe and at least 50,000 in America. A particular interest attaches to it in the fact that a localized revival of the disease was caused in Spain in 1890 by the disturbance of the graves of some of the victims who had died of cholera four years previously.

1892-95.—This great invasion reverted again to the old overland route, but the march of the disease was of unprecedented rapidity. Within less than five months it travelled from the North-West Provinces of India to St Petersburg, and probably to Hamburg, and thence in a few days to England and the United States. This speed, in such striking contrast to the slow advance of former occasions, was attributed, and no doubt rightly, to improved steam transit, and particularly the Transcaspian railway. The progress of the disease was traced from place to place, and almost from day to day, with great precision, showing how it moves along the chief highways and is obviously carried by man. The main facts are as follows:—Cholera was extensively and severely prevalent in India in 1891, causing 601,603 deaths, the highest mortality since 1877. In March 1892 it broke out at the Hardwar fair, a day or two before the pilgrims dispersed; on 19th April it was at Kabul, on 1st May at Herat, and 26th May at Meshed. From Meshed it moved in

three directions—due west to Tehran in Persia, north-east by the Transcaspian railway to Samarkand in Central Asia, and north-west, by the same line in the opposite direction, to Uzun-ada on the Caspian Sea. It reached Uzun-ada on 6th June; crossed to Baku, 18th June; Astrakhan, 24th June; then up the Volga to Nijni Novgorod, arriving at Moscow and St Petersburg early in August. The part played by steam transit is clear from the fact that the disease took no longer to travel all the way from Meshed to St Petersburg by rail and steamboat than to traverse the short distance from Meshed to Tehran by road. On 16th August cases began to occur in Hamburg; on 19th August a fireman was taken ill at Grangemouth in Scotland, where he had arrived the day before from Hamburg; and on 31st August a vessel reached New York from the same port with cholera on board. On 8th September the disease appeared in Galicia, having moved somewhat slowly westwards across Russia into Poland, and on 26th September it was in Budapest. Holland and Servia were also attacked, while isolated cases were carried to Norway, Denmark, and Italy. Meanwhile two entirely separate epidemics were in progress elsewhere. The first was confined to Arabia and the Somali coast of Africa, and was connected with the remains of an outbreak in Syria and Arabia in 1890-91. The second arose mysteriously in France about the time when the overland invasion started from India. The first known case occurred in the prison at Nanterre, near Paris, on 31st March. Paris was affected in April, and Havre in July. The origin of this outbreak, which was of a much less violent character than that which came simultaneously by way of Russia, was never ascertained. Its activity was confined to France, particularly in the neighbourhood of Paris, together with Belgium and Holland, which was placed between two fires, but escaped with but little mortality. The number of persons killed by cholera in 1892, outside of India, was reckoned at 378,449, and the vast majority of those died within six months. The countries which suffered most severely were as follows:—European Russia, 151,626; Caucasus, 69,423; Central Asian Russia, 31,804; Siberia, 15,037—total for Russian empire, 267,890; Persia, 63,982; Somaliland, 10,000; Afghanistan, 7000; Germany, 9563; France, 4550; Hungary, 1255; Belgium, 961. Curiously enough, the south of Europe, which had been the scene of the previous epidemic visitation, escaped. The disease was of the most virulent character. In European Russia the mortality was 45·8 per cent. of the cases, the highest rate ever known in that country; in Germany it was 51·3 per cent.; and in Austria-Hungary, 57·5 per cent. Of all the localities attacked, the case of Hamburg was the most remarkable. The presence of cholera was first suspected on 16th August, when two cases occurred, but it was not officially declared until 23rd August. By that time the daily number of victims had already risen to some hundreds, while the experts and authorities were making up their minds whether they had cholera to deal with or not. Their decision eventually came too late and was superfluous, for by 27th August the people were being stricken down at the rate of 1000 a day. This rate was maintained for four days, after which the vehemence of the pestilence began to abate. It gradually declined, and ceased on 14th November. During those three months 16,956 persons were attacked and 8605 died, the majority within the space of a few weeks. The town, ordinarily one of the gayest places of business and pleasure on the Continent, became a city of the dead. Thousands of persons fled, carrying the disease into all parts of Germany; the rest shut themselves indoors; the shops were closed, the trams ceased to run, the hotels and restaurants were deserted, and few vehicles or pedestrians were seen in the streets. At the cemetery, which lies about 10 miles from the town, some hundreds of men were engaged day and night digging long trenches to hold double rows of coffins, while the funerals formed an almost continuous procession along the roads; even so the victims could not be buried fast enough, and their bodies lay for days in sheds hastily run up as mortuaries. Hamburg had been attacked by cholera on fourteen previous occasions beginning with 1831, but the mortality had never approached that of 1892; in the worst year, which was 1832, there were only 3687 cases and 1765 deaths. The disease was believed to have been introduced by Jewish emigrants passing through on their way from Russia, but the importation could not be traced. The Jews were segregated and kept under careful supervision from the middle of July onwards, and no recognized case occurred among them. The total number of places in Germany in which cholera appeared in 1892 was 269, but it took no serious hold anywhere save in Hamburg. The distribution was chiefly by the waterways, which seem to affect a larger number of places than the railways as carriers of cholera. In Paris 907 persons died, and in Havre 498. Between 18th August and 21st October 38 cases were imported into England and Scotland through eleven different ports, but the disease nowhere obtained a footing. Seven vessels brought 72 cases to the United States, and 16 others occurred on shore, but there was no further dissemination.

During the winter of 1892-93 cholera died down, but never wholly ceased in Russia, Germany, Austria-Hungary, and France. With the return of warm weather it showed renewed activity, and prevailed extensively throughout Europe. The recorded mortality for the principal countries was as follows:—Russia (chiefly western provinces), 41,047; Austria-Hungary, 4669; France, 4000; Italy, 3036; Turkey, 1500; Germany, 298; Holland, 376; Belgium, 372; England, 139. Hardly any country escaped altogether; but Europe suffered less than Arabia, Mesopotamia, and Persia. Cholera broke out at Mecca in June, and owing to the presence of an exceptionally large number of pilgrims caused an appalling mortality. The chief shereef estimated the mortality at 50,000. The pilgrims carried the disease to Asia Minor and Constantinople. In Persia also a recrudescence took place and proved enormously destructive. Dr Barry estimated the mortality at 70,000. At Hamburg, where new waterworks had been installed with sand filtration, only a few sporadic cases occurred until the autumn, when a sudden but limited rush took place, which was traced to a defect in the masonry permitting unfiltered Elbe water to pass into the mains. In England cholera obtained a footing on the Humber at Grimsby, and to a lesser extent at Hull, and isolated attacks occurred in some 50 different localities. Excluding a few ship-borne cases, the registered number of attacks was 287, with 135 deaths, of which 9 took place in London. It is interesting to compare the mortality from cholera in England and Wales, and in London, for each year in which it has prevailed since registration began:—

| Year. | England and Wales. | | London. | |
|---|---|---|---|---|
| | Deaths. | Deaths per 10,000 living. | Deaths. | Deaths per 10,000 living. |
| 1848 | 1,908 | 1·1 | 652 | 2·9 |
| 1849 | 53,293 | 30·3 | 14,137 | 61·8 |
| 1853 | 4,419 | 2·4 | 883 | 3·5 |
| 1854 | 20,097 | 10·9 | 10,738 | 42·8 |
| 1865 | 1,297 | 0·6 | 196 | 0·6 |
| 1866 | 14,378 | 6·8 | 5,596 | 18·4 |
| 1893 | 135 | 0·05 | 9 | 0·002 |
| 1894 | nil | nil | nil | nil |

In 1894 no deaths from cholera were recorded in England, but on the Continent it still prevailed over a wide area. In Russia over 30,000 persons died of it, in Germany about 500, but the most violent outbreak was in Galicia, where upwards of 8000 deaths were registered. In 1895 it still lingered, chiefly in Russia and Galicia, but with greatly diminished activity. In that year Egypt, Morocco, and Japan were attacked, the last severely. Since then cholera has been in abeyance until the severe epidemic in India in 1900.

**Prevention.**

The great invasion just described was fruitful in lessons for the prevention of cholera. It proved that the one real and sufficient protection lies in a standing condition of good sanitation backed by an efficient and vigilant sanitary administration. The experience of Great Britain was a remarkable piece of evidence, but that of Berlin was perhaps even more striking, for Berlin lay in the centre of four fires, in direct and frequent communication with Hamburg, Russia, France, and Austria, and without the advantage of a sea frontier. Cholera was repeatedly brought into Berlin, but never obtained a footing, and its successful repression was accomplished without any irksome interference with traffic or the ordinary business of life. The general success of Great Britain and Germany in keeping cholera in check by ordinary sanitary means completed the conversion of all enlightened nations to the policy laid down so far back as 1865 by Sir John Simon, and advocated by Great Britain at a series of international congresses—the policy of abandoning quarantine, which Great Britain did in 1873, and trusting to sanitary measures with medical inspection of persons arriving from infected places. This principle was formally adopted at the international conference held at Dresden in 1893, at which a convention was signed by the delegates of Germany, Austria, Belgium, France, Great Britain, Italy, Russia, Switzerland, Luxemburg, Montenegro, and the Netherlands. Under this instrument the practice is broadly as follows, though the procedure varies a good deal in different countries:—Ships arriving from infected ports are inspected, and if healthy are not detained, but bilge-water and drinking-water are evacuated, and persons landing may be placed under medical supervision without detention; infected ships are detained only for purposes of disinfection; persons suffering from cholera are removed to hospital; other persons landing from an infected ship are placed under medical observation, which may mean detention for five days from the last case, or, as in Great Britain, supervision in their own homes, for which purpose they give their names and places of destination before landing. All goods are freed from restrictions, except rags and articles believed to be contaminated by cholera matters. By land, passengers from infected places are similarly inspected at the frontiers and their luggage "disinfected"—in all cases a pious ceremony of no practical value, involving a short but often vexatious delay; only those found suffering from cholera can be detained. Each nation is pledged to notify the others of the existence within its own borders of a "foyer" of cholera, by which is meant a focus or centre of infection. The precise interpretation of the term is left to each Government, and is treated in a rather elastic fashion by some, but it is generally understood to imply the occurrence of non-imported cases in such a manner as to point to the local presence of infection. The question of guarding Europe generally from the danger of diffusion by pilgrims through the Red Sea was settled at another conference held in Paris in 1894. The provisions agreed on included the inspection of pilgrims at ports of departure, detention of infected or suspected persons, and supervision of pilgrim ships and of pilgrims proceeding overland to Mecca.

The substitution of the procedure above described for the old measures of quarantine, and other still more drastic interferences with traffic, presupposes the existence of a sanitary service and fairly good sanitary conditions if cholera is to be effectually prevented. No doubt if sanitation were perfect in any place or country, cholera, along with many other diseases, might there be ignored, but sanitation is not perfect anywhere, and therefore it requires to be supplemented by a system of notification with prompt segregation of the sick and destruction of infective material. These things imply a regular organization, and it is to the public health service of Great Britain that the complete mastery of cholera has mainly been due in recent years, and particularly in 1893. Of sanitary conditions the most important is unquestionably the water-supply. So many irrefragable proofs of this fact were given during 1892-93 that it is no longer necessary to refer to the time-honoured case of the Broad Street pump. At Samarkand three regiments were encamped side by side on a level plain close to a stream of water. The colonel of one regiment took extraordinary precautions, placing a guard over the river, and compelling his men to use boiled water even for washing. Not a single case of cholera occurred in that regiment, while the others, in which only ordinary precautions were taken, lost over 100 men. At Ashkabad the cholera had almost disappeared, when a banquet was given by the governor in honour of the Czar's name-day. Of the guests one-half died within twenty-four hours; a military band, which was present, lost 40 men out of 50; and one regiment lost half its men and 9 officers. Within forty-eight hours 1300 persons died out of a total population of about 13,000. The water-supply came from a small stream, and just before the banquet a heavy rain-storm had occurred, which swept into the stream all surface refuse from an infected village higher up and some distance from the banks. But the classical example was Hamburg. The water-supply is obtained from the Elbe, which became infected by some means not ascertained. The drainage from the town also runs into the river, and the movement of the tide was sufficient to carry the sewage matter up above the water-intake. The water itself, which is no cleaner than that of the Thames at London Bridge, underwent no purification whatever before distribution. It passed through a couple of ponds, supposed to act as settling tanks, but owing to the growth of the town and increased demand for water, it was pumped through too rapidly to permit of any subsidence. Eels and other fish constantly found their way into the houses, while the mains were lined with vegetation and crustacea. The water-pipes of Hamburg had a peculiar and abundant fauna and flora of their own, and the water they delivered was commonly called *Fleischbrühe*, from its resemblance to thick soup. On the other hand, at Altona, which is continuous with Hamburg, the water was filtered through sand. In all other respects the conditions were identical, yet in Altona only 328 persons died, against 8605 in Hamburg. In some streets one side lies in Hamburg, the other in Altona, and cholera stopped at the dividing line, the Hamburg side being full of cases and the Altona side untouched. In the following year, when Hamburg had the new filtered supply, it enjoyed equal immunity, save for a short period when, as we have said, raw Elbe water accidentally entered the mains.

But water, though the most important condition, is not the only one affecting the incidence of cholera. The case of Grimsby furnished a striking lesson to the contrary. Here the disease obtained a decided hold, in spite of a pure water-supply, through the fouling of the soil by cesspits and defective drainage. At Havre also its prevalence was due to a similar cause. Further, it was

conclusively proved at Grimsby that cholera can be spread by sewage-fed shell-fish. Several of the local outbreaks in England were traced to the ingestion of oysters obtained from the Grimsby beds. In short, it may be said that all insanitary conditions favour the prevalence of cholera in some degree. Preventive inoculation with an attenuated virus was introduced by M. Haffkine, and has been extensively used in India, with considerable appearance of success so far as the statistical evidence goes.

As already remarked, the latest manifestations of cholera show that it has lost none of its former virulence and fatality. The symptoms, about which nothing need be said, are now regarded as the effects of the toxic action of the poison formed by the micro-organisms upon the tissues and especially upon the nervous system. But this theory has not led to any effective treatment. Drugs in great variety were tried in the Continental hospitals in 1892, but without any distinct success. The old controversy between the aperient and the astringent treatment reappeared. In Russia the former, which aims at evacuating the poison, was more generally adopted; in Germany the latter, which tries to conserve strength by stopping the flux, found more favour. Two methods of treatment were invariably found to give great relief, if not to prolong life and promote recovery—the hot bath and the injection of salted water into the veins or the subcutaneous tissue. These two should always be tried in the cold and collapsed stages of cholera.

*Treatment.*

*Cholera Nostras.*—The word *nostras*, which is good Latin, and used by Cicero, means "belonging to our country." It is applied to the original form of cholera, known from time immemorial, in order to distinguish it from the Asiatic variety, which was unknown until the 19th century. The relations between the two are very obscure. Clinically they may exactly resemble each other, and bacteriology has not been able to draw an absolute line between them. The real difference is epidemiological. Cholera—that is, cholera nostras—was described by Sydenham two centuries ago as sometimes epidemic, but only the Asiatic variety has been known to behave as a destructive pestilence; by cholera nostras is generally meant a disease which may be violent in individual cases, but possesses no epidemic significance.

See *Local Government Board Reports*, 1892-93-94-95.—CLEMOW. *The Cholera Epidemic of 1892 in the Russian Empire.*—WALL. "Asiatic Cholera."—NOTTER. *Epidemiological Society's Transactions*, vol. xvii. (A. SL.)

**Chorley,** municipal borough, parish, and market town, England, in the Chorley division of Lancashire, 22 miles N.W. from Manchester by rail. Recent public buildings include St George's church institute and a cottage hospital and public dispensary. There is a public free library. Cotton-spinning and the manufacture of cotton and muslin are extensively carried on, and there are also iron and brass foundries and boiler factories. Area of municipal borough, 3614 acres. Population (1881), 19,478; (1891), 23,087; (1901), 26,850.

**Chórum,** ancient *Euchaita*, altitude 2300 feet, a town of Asia Minor, in the Yuzgat sanjak of the Angora vilâyet, situated at the edge of a wide plain. Euchaita was attacked by the Huns A.D. 508, and became a centre of religious enthusiasm. Population, 12,500, including a few Christians.

**Chota** (or CHUTIA) **Nagpur,** a division of British India in Bengal, consisting of five British districts and nine tributary states. It is a hilly, forest-clad plateau, inhabited mostly by aboriginal races, between the basins of the Sone, the Ganges, and the Mahanadi. The five British districts are Hazaribagh, Lohardaga, Palamau, Manbhum, and Singhbhum. The total area is 26,966 square miles, and in 1891 the population was 4,628,792, giving an average density of 172 persons per square mile, compared with 471 for Bengal generally. Christian missions have been specially active in this tract. In 1891 the number of native converts was 88,897, mostly in Lohardaga, being more than half the total for all Bengal. In 1896-97 five missions maintained 203 schools, attended by 5063 boys and 1208 girls. The nine tributary states of Chota Nagpur are Sirguja, Gangpur, Udaipur, Jashpur, Bonai, Korea, Changbhakar, Kharsawan, and Seraikella. The two last are tiny areas within the British district of Singhbhum, on the line of the Bengal-Nagpur railway. The others stretch over a large tract of hills separating Bengal from the Central Provinces. The total area comprises 16,054 square miles. The population in 1891 was 883,359, giving an average density of 55 persons per square mile, ranging from 238 in Kharsawan to 20 in Changbhakar. In 1901 the total population was 982,439, showing an increase of 11 per cent. The total gross revenue of the chiefs is estimated at Rs.2,40,000; the number of schools is 79, with 1626 pupils. The Bengal-Nagpur railway touches on Udaipur, and runs through a considerable part of Gangpur. In this last state there were serious disturbances in 1896, but the administration is improving under closer British supervision.

**Christadelphians** (Χριστοῦ ἄδελφοι), a community founded by John Thomas (1848), who studied medicine in London and then migrated to America. There he at first joined the "Campbellites," but afterwards struck out independently, preaching largely upon the application of Hebrew prophecy and of the language of the Apocalypse to current and future political events. In America and in Great Britain he gathered a number of adherents, and formed a community which is said to have extended to most English-speaking countries. It consists of exclusive "Ecclesias," with neither ministry nor organization. The members meet on Sundays to "break bread" and discuss the Bible. Their theology is strongly millenarian, centring in the hope of a world-wide theocracy, with its seat at Jerusalem. They believe that they alone have the true exegesis of Scripture, and that the "faith of Christendom" is "compounded of the fables predicted by Paul." No statistics are published.

See ROBERTS. *Dr Thomas: His Life and Work*, and *A Declaration of the Truth*, &c. Birmingham.

**Christchurch,** town in Selwyn county, New Zealand, next to Dunedin the most populous town in South Island. Its manufactures are of importance, though its position is still due mainly to the large agricultural district round it. Its cathedral church, museum, public library, public gardens, agricultural show-ground, and chief cricket-grounds are the best of their kind in the colony. Three hundred students attend lectures at Canterbury College. Steam tramways connect the town with the sea-side, and though flat, it is well drained and healthy. Its fine public park has been well planted and improved. Its suburbs are noted for the number and taste of their private gardens. Mean temperature for the year, 52°; average yearly rainfall, 26 inches. Population (1901), 17,537; including suburbs, 57,041.

**Christian IX.,** KING OF DENMARK (1818-——), fourth son of Duke Wilhelm of Schleswig-Holstein-Sonderburg Glücksburg, was born 8th April 1818, and succeeded to the throne on the death of King Frederick VII., 15th November 1863, in accordance with the provisions of the

Treaty of London of 8th May 1852, and the Danish law of succession of 31st July 1853. On 26th August 1842 he married Louise, daughter of Landgrave Wilhelm of Hesse-Cassel. In 1846, when the whole house of Schleswig-Holstein signed the famous "Protest," Christian held back, and he was the only prince of that house who remained in the military service of Denmark from 1848-50. He was therefore clearly indicated as the proper person to fill the vacant place of heir to the Danish throne, to which he had a claim in right of his wife, the cousin and heiress of Frederick VII., and he was so recognized by the Treaty of Warsaw of 5th January 1851. Upon coming to the throne his first act was to ratify the Eider Danish constitution, by which the Duchy of Schleswig was incorporated with Denmark. This led to a war with Prussia and Austria, which ended with the Peace of Vienna, 30th October 1864, Christian ceding Schleswig-Holstein and Lauenburg to Germany. The king's pronounced conservatism has led to serious collision in the Danish Parliament, which from 1873-95 regularly refused to vote the budgets presented by his majesty's ministers. On 29th September 1898 the king lost his consort Louise, who died at the age of eighty-one. Their numerous children made brilliant marriages: (1) Frederick, born 3rd June 1843; married, 26th April 1898, to Princess Alexandra of Mecklenburg; (2) Alexandra, born 1st December 1844; married, 10th March 1863, to the Prince of Wales, now King Edward VII.; (3) Wilhelm, born 24th December 1845, elected King of the Hellenes, under the title of Georgios, by the Greek National Assembly, 31st March 1863; married, 27th October 1867, to Olga Constantinowna, grand duchess of Russia; (4) Marie Dagmar, born 26th November 1847; married, 9th November 1866, to Alexander III., Czar of Russia; (5) Thyra, born 29th September 1853; married, 21st December 1878, to Prince Ernest Augustus, duke of Cumberland; (6) Waldemar, born 27th October 1858; married, 22nd October 1885, to Princess Marie d'Orléans.

# CHRISTIAN CHURCH, THE.

THE present article does not deal with the state, condition, or progress of any particular or national church. The recent history of various Christian communions will be found under their special and appropriate titles; but, in addition to those articles which treat of the present position and prospects of particular churches, it has been thought well to devote some space to a wider purpose, and to endeavour to measure the progress of what may for convenience' sake be called the Christian Church at large. The object, therefore, of this article is to deal with the advance of the Church of Christ generally; it aims at putting before its readers the present position of Christendom in relation to the moving forces and influences of the world; in brief, it is an attempt to answer the question, How far has the Christian idea advanced among men? Naturally and necessarily the question suggests a wide range of inquiry, and, to be fully answered, would require a treatise rather than a brief article; but while it will be needful, from time to time, to take a backward glance at other and earlier ages, we shall, as far as is possible, restrict ourselves to the movements of recent years, and the period which we wish to keep specially in mind will be the last generation. Roughly speaking, our sketch will be mainly occupied with the period covered by the latter half of the 19th century. We shall endeavour to measure the progress of Christianity in various ways, by reference to statistical facts, to influences in matters not reducible to statistics, and, lastly, by reference to certain changes in the direction of Christian energy and methods observable in recent years.

## I. The Measurement of the Progress of Christianity as expressed by Statistics.

Statistics are proverbially misleading; but while we may well use them with caution, and exercise careful self-restraint in making hasty inferences from them, they are valuable within their measure and scope. The individual items must not be unduly pressed; we must even bear in mind that the apparent significance of their details may be readily misunderstood; but they furnish the basis of judging the general direction of a given movement; they enable us to discriminate between the inrush of the wave and the incoming of the tide. Thus we note in the history of Christianity certain periods of reaction; the rapid progress in one age is checked in another. There were times when the very life of Christianity seemed to be threatened; there are places where flourishing Christian churches existed, and from which they have vanished. To take an example of a period of reaction, it seems well established that towards the close of the 2nd century the Christian population in the Roman empire declined. Persecution diminished the numbers of the Church. In the 18th century Voltaire felt justified in predicting that Christianity was about to disappear from among men. He spoke more from his wishes than his judgment, perhaps; but he was too shrewd an observer of his times to have committed himself to prophecy without some real or apparent justification. He saw that to a large extent the intellectual classes of his countrymen had been alienated or seduced from their faith. He did not perceive the religious forces which were even then at work preparing for the rejuvenation of Christian energy. As there have been epochs of arrested progress in Christian history, so there have been places where Christianity has made progress, but where the promise of earlier successes has not been sustained. Readers of Christian history have asked, What became of the half-million converts in South India who owed their faith to Xavier, or of the 300,000 in Ceylon who were the fruits of Dutch missionary effort? Still more, readers will recall the story of Christianity in North Africa, and the vigorous churches in Carthage, Alexandria, and Hippo. Few facts mark more eloquently the temporary ebb of Christian influence than the decay of the churches which were once the churches of Cyprian, Augustine, and Origen.

Christianity—it is well to realize the fact—has been subject to certain human influences, or, to speak more correctly, the Christian Church numbered among its adherents multitudes who were swayed by the ordinary emotions and passions of mankind, and were open to the influences of fear or gain. There were favourable as well as unfavourable times. This was frankly recognized by the earliest Christian historian, when he noted the fact that when persecution ceased the Church was multiplied (Acts ix. 31). There were, in fact, periods which tested the stability of men's faith, and which enabled men to distinguish between the transitory wave, whose size and bulk was due to some favourable wind, and the rising tide, which owed its strength to more heavenly influence. The table which we present below reflects these fluctuating conditions, but, on the whole, witnesses to a steady and continuous advance.

(i.) The *proportion of the Christian population to the population of the world* is the subject of our first statistical inquiry. Gibbon estimated that on the most favourable estimate the Christian population of the empire before

the days of Constantine was one-twentieth of the whole (*Hist.*, Milman's edit., 1846, vol. i. p. 520). Bishop Lightfoot so far agreed with Gibbon that he regarded (*Historical Essays*, pp. 79, 80) the estimate as too favourable, but he accepted it as a sufficiently just one for purposes of comparison. He reckoned that the empire of Rome ruled over from one-seventh to one-tenth of the then population of the world; thus the Christian population in the close of the 3rd century could only claim at the most one-twentieth of one-seventh of the human race—*i.e.*, only one in every 140. Bishop Lightfoot, in conclusion, adopted $\frac{1}{150}$ as the proportion of Christians to the world population at that time. He claimed that the proportion in the present day was one in five. But there is reason to think that this is below the true proportion. The Christian Church to-day can, it is believed, claim one-third of the population of the world.

The following tables can only be accepted as rough and approximate estimates. We have very few data for determining either the population of the world or the Christian population from century to century, but on the whole the proportions set out here are probably sufficiently near the fact for general purposes of comparison.

The accompanying table exhibits at a glance the general progress of Christianity:—

| A.D. | World Population. | Christian Population. |
|---|---|---|
| 100 | .. | 5,000,000 |
| 200 | ... | 2,000,000 |
| 300 | . | 5,000,000 |
| 400 | .. | 10,000,000 |
| 800 | ... | 30,000,000 |
| 900 | ... | 40,000,000 |
| 1000 | .. | 50,000,000 |
| 1500 | ... | 100,000,000 |
| 1600 | .. | 125,000,000 |
| 1700 | ... | 155,000,000 |
| 1800 | 1,000,000,000 | 200,000,000 |
| 1875 | 1,396,842,000 | 394,000,000 |
| 1880 | ... | 410,000,000 |
| 1890 | ... | 493,000,000 |
| 1896 | 1,500,000,000 | 500,000,000 |

The diminution between A.D. 100 and A.D. 200 is accounted for by persecution; the rapid increase between A.D. 300 and A.D. 400 to the patronage of the Emperor Constantine. The Christian reader will note, however, with satisfaction that the increase within the last hundred years has been more rapid than in any similar period, and that the ratio of increase has been augmented since 1880. The Protestant reader will observe that the increase within the last three or four hundred years has been more rapid than in the period preceding the Reformation.

The increase in the 19th century is represented by the following figures. The percentage of the Christian population to the world population, which was 20 in 1800, was 28·5 in 1875 and was 33·3 in 1896; and whereas the average yearly increment between 1800 and 1875 was something over 2,500,000, it was over 5,000,000 between 1875 and 1896; or, to put the result in quarter-century periods, whereas the average gain for each of the first three quarters of the 19th century was 65,000,000, the average gain of the last quarter of the century was 106,000,000. It is worthy of note that this coincides with the period during which intercession for missions became a recognized duty on the part of the Church. Dr Dorchester speaking of the United States, says in his *Problems of Religious Progress* that whereas in the beginning of the century the proportion of communicants to the population was one in fourteen or fifteen, in 1890 it was one in four or five; or, in other words, while the population had grown 11·8-fold, the communicants had increased 38-fold.

Thus it would seem that simultaneously with the deepening of the religious spirit in the Christian churches there has been rapid progress in the spread of Christianity. We can only indicate this advance by the general figures we have cited; but it may serve to illustrate the general character of the progress in non-Christian lands if we set down here the figures which relate to India. The number of Christians in India between 1841-51 was estimated at 91,000; between 1851-61 at 138,000; and between 1861-71 at 224,000; between 1871-81 at 897,216; and between 1881-91 at 2,284,380. These figures represent a growth of 50 per cent. for each decade. Beside this we may place two very remarkable results of the missionary work in West Africa. In Sierra Leone, where missionary work can scarcely be said to have commenced till 1815, there is now a self-supporting, self-governing, self-extending church, and seven out of eight of the inhabitants are Christian.

(ii.) The measure of Christian progress may also be given by statistics indicating *world influence* or ascendancy.

***Political influence.***

(*a*) More remarkable than the growth in the number of adherents is the increase of the influence and power of the Christian nations. Thus it has been reckoned that three hundred years ago 3,480,900 square miles of the world's surface were under the government of the Christian nations, and 45,619,100 square miles were under the government of non-Christian peoples —*i.e.*, one mile out of every thirteen was under Christian governing influence. Now, however, the figures are altered: the number of square miles under Christian government is 40,317,200, that under non-Christian influence is 8,782,300—*i.e.*, the Christian nations rule between four and five square miles for every one governed by non-Christian peoples, or 82 per cent. of the governed area of the world.

(*b*) The supremacy of Christian governing power is shown in the statistics of the populations now dependent upon the Christian nations. In 1500 only 100,000,000 of people were under Christian rule, now there are 900,000,000.

(*c*) It may be interesting to note the relative ascendancy of the different forms of Christianity in this world-influence. For convenience' sake we may take the three broad divisions, viz.: the Greek, the Roman Catholic, and the Protestant nations respectively. The area of the world ruled by Christian and non-Christian people is between 49,000,000 and 50,000,000 square miles. Of these the rule is distributed as follows:—Non-Christian nations, 8,782,000; Greek (Christian), 8,752,000; Roman Catholic (Christian), 14,147,000; Protestant (Christian), 17,417,000; or in percentages, non-Christian, 18 per cent.; Greek, 18 per cent.; Roman Catholic, 28 per cent.; Protestant, 36 per cent. If we examine the populations under these governments respectively, we have the following results:—Under Christian rule, 890,000,000; distributed as follows: under Greek, 128,000,000; under Roman Catholic, 242,000,000; under Protestant, 520,000,000. The result may be exhibited by the following table, which compares the populations under these governments in 1700 and in 1900 respectively:—

| Date. | Greek. | Roman Catholic. | Protestant. | Total. |
|---|---|---|---|---|
| 1700 | 33,000,000 | 90,000,000 | 32,000,000 | 155,000,000 |
| 1900 | 128,000,000 | 242,000,000 | 520,000,000 | 890,000,000 |

(*d*) Alongside these figures we may place another fact. There has been a marked change in the diffusion of European languages during the last 100 years, and it will be readily seen that the diffusion of language is, if not a diffusion of influence, yet a measure of its diffusion. In 1800 French was spoken by 31,000,000 of people; German and Russian tongue each by 30,000,000; the Spanish by 26,000,000; and English by 20,000,000. In 1890 the figures stood thus: French, 51,000,000; German and

Russian, each 75,000,000; Spanish, 42,000,000; and English, 111,000,000. In other words, English, which was the least influential of European languages, now holds the leading place, while French has fallen from the first to the fourth place; or, to put this fact into percentages, the increase of the diffusion of these languages has been in ninety years as follows:—

| | |
|---|---|
| French . . . . . | 64·5 per cent. |
| German, Russian . . . . . | 150 ,, |
| Spanish . . . . . | 61·5 ,, |
| English . . . . . | 450 ,, |

It will be seen that the increase of the Teutonic races is far in excess of that of the Latin races; and when we keep in mind the greater birth-rate in the Teutonic races,[1] we can realize that, unless some great and unexpected change takes place, the future influence of the Christian nations will be increasingly in the hand of the Teutonic or Protestant division of Christendom.

(*e*) The importance and significance of the ascendancy of Christian nations will be best realized by placing side by side the population and area of a selected number of the Christian nations and the native or colonial populations and areas now under their rule. We draw our statistics from an interesting monograph carefully brought up to date by Lieut.-Colonel V. Murari Brá, instructor in geography in the Scuola di Guerra in Italy.

| | Mother Country. | | Dependencies. | |
|---|---|---|---|---|
| | Area. | Population. | Area. | Population. |
| Great Britain | 314,950 | 41,220,000 | 27,861,000 | 348,496,000 |
| Germany . | 540,658 | 56,000,000 | 2,605,100 | 9,230,000 |
| Holland . | 33,000 | 5,200,000 | 2,045,700 | 35,500,000 |
| Denmark . | 38,830 | 2,175,000 | 194,580 | 130,000 |
| United States | 9,450,000 | 78,500,000 | 443,060 | 9,636,000 |
| France . . | 536,408 | 38,800,000 | 8,812,710 | 50,340,000 |
| Italy . . | 286,648 | 32,000,000 | 477,300 | 600,000 |
| Spain . . | 497,244 | 18,100,000 | 709,450 | 340,000 |
| Russia . . | 22,430,000 | 135,000,000 | 310,000 | 3,000,000 |
| | 34,127,738 | 406,995,000 | 43,458,900 | 457,272,000 |

If we group the nations according to kinship, arranging them under the classes of Teutonic, Latin, and Slav races respectively, we get the following results:—

| | Mother Countries. | | Dependencies. | |
|---|---|---|---|---|
| | Area. | Population. | Area. | Population. |
| Teutonic {European only} | 927,438 | 104,595,000 | 32,706,380 | 393,356,000 |
| Latin . . . . | 1,320,300 | 88,900,000 | 9,999,460 | 51,280,000 |
| Slav . . . . | 22,430,000 | 135,000,000 | 310,000 | 3,000,000 |

Thus the governing power of the Teutonic, Latin, and Slav races in Europe may be represented by the following figures:—For every square kilometre or square mile of mother country, the Teutonic races govern 35, the Latin races govern 7·5, and the Slav 00·13 square miles; and for every inhabitant in the mother country there are in the dependencies of the Teutonic nations 3·7 inhabitants, in the Latin ·057, and in the Slav ·002. It is no flight of rhetoric to say that almost two-thirds of the world's population and four-fifths of its area are now under the government of Christian nations, and by far the largest share of this has fallen into the guardianship of the Teutonic nations, who govern not far short of 600,000,000 of people, or more than two-thirds of the whole population now under Christian rule. So far then as political and administrative influence is concerned, the ascendancy of the Christian nations is beyond all doubt.

In this influence wealth counts as an important factor, and the accumulations of that class of power which belongs to what is called wealth are chiefly in the hands of Christian lands. They make the markets of the world; they direct by far the largest portion of its commerce. And when wealth is measured as so much per head of the population, the non-Christian peoples scarcely enter into the calculation of the political economists. It is no doubt true that in countries not yet commercially organized there are no materials on which to base a calculation, but it is also true that in a sense it is only when the means of production are organized that wealth in any economic sense may be said to exist; and it is in the Christian countries that these means of power are practically concentrated. The wealth per head of the Christian nations varies from £60 in Russia to £302 in England; France stands here at the head of the Latin nations with £253 per head, as England does at the head of the Teutonic nations. The average wealth of the Teutonic nations is £226 per head, that of the Latin £140, and that of the Slav about £6.

***Economic influence.***

(iii.) As a statistical measure of Christian energy, it will be convenient to notice some *phases of Christian activity* which have marked recent years.

(*a*) There has been a very marked development of missionary enterprise (see MISSIONS). It is difficult to present a statistical estimate of the force of this development. It will be best to point out a few salient facts. We shall first confine ourselves to that which is popularly called missionary work, viz., Christian labours carried on among heathen or non-Christian peoples. The number of separate societies for that purpose has largely increased during the last century. It has been estimated that in 1790 there were in Great Britain only two societies which contemplated missionary work as within the scope of their operations, viz., the Society for the Promotion of Christian Knowledge and the Society for the Propagation of the Gospel. Neither of these societies, however, directed its work solely towards the heathen world: the former aimed at circulating Christian literature in all quarters; the latter paid, and rightly paid, special attention to the needs of Britons in the colonies and in foreign parts. A century has seen the establishment of numerous societies for direct and exclusive missionary work. It has been estimated that the number of missionary societies is little short of 300; some of these are small and comparatively poor, but others are large and important organizations, resembling great State departments, commanding and distributing large revenues, and entailing upon their committees of management wide and varied responsibility and an almost statesmanlike judgment in the handling of difficult and delicate problems.

(*b*) There are in Great Britain alone twenty-nine foreign missionary societies. Four or five of these administer each an income of over £100,000 a year. They occupy nearly 10,000 stations and sub-stations; they employ 2739 European missionaries, upwards of 1800 women workers, and more than 27,000 native helpers. In the article on MISSIONS a full survey of the condition and prospects of various missionary societies is given. Here it may be enough to notice that the United States missionary societies employ about half the number of male missionaries sent out by Great Britain, while their women missionaries nearly equal the British, being over 1700; their native agents are about 13,000; and the estimated missionary contributions (Protestant) of the

[1] The birth-rate of all European countries declined between 1875 and 1900, but the statement in the text is still substantially true, inasmuch as the birth-rate in Germany is still greatly in excess of the birth-rate in the Latin kingdoms. The decline in the birth-rate in Great Britain is serious, but it is nothing like the decline in France; though all English-speaking people should earnestly consider the population question as it affects their own race.

English-speaking world amount to nearly £3,000,000 annually.

(*c*) In this connexion may be instanced the diffusion of the Bible in the world. The British and Foreign Bible Society was founded in 1804; the American Bible Society twelve years later; in 1891 these two societies were but two out of 80 Bible societies in the world. In 1800 the translations of the Bible were 47 in number; there are now 90 complete and 230 partial versions, making a total of 320 translations more or less complete.

(*d*) Evidence of the continuous growth of aggressive Christian energy may be found in the rapid increase of missionary bishoprics which has taken place of recent years. In the first half of the 19th century 23 new bishoprics were founded; in the latter half there were 69; the rate of increase was trebled in the second period. The same feature is shown in the Protestant Episcopal Church of America. During the 19th century it has added 73 new bishoprics, and 52 of these belong to the latter half of it. The two churches added to their organization 165 new sees in the same century, and no fewer than 73 of these have come into existence since 1870.

(*e*) But apart from figures, the whole position of Christian business has undergone a change in public estimation. Missionary meetings used to be dull, and missionary literature flat and insipid. Now all this is changed. Meetings are large and enthusiastic, and missionary literature displays a culture and breadth of treatment unknown to our fathers. The journals or magazines issued by societies treat of every land from Greenland to Patagonia, from Japan to the Southern Islands, and they set forth with intelligence and learning questions of geography, philology, sociology, art and science, native manners and customs, in addition to, or in illustration of, direct missionary information. The popular sympathy which so often waits on popular knowledge has been further enlisted by what are known as missionary loan exhibitions. In these vivid illustrations of native life and missionary work are given by means of costumes, curiosities, and models. To such an exhibition in Birmingham there were as many as 100,000 visitors; and everywhere similar exhibitions have been crowded.

As a witness to the changed popular feeling towards missionary enterprise, perhaps nothing can be more striking than the fact that there are now in England and America public monuments commemorating the zeal and devotion of the missionary. In Washington Square in New York there is a church which is a memorial to Judson the missionary; in Westminster Abbey there is a monument to David Livingstone, who lies in the ancient national shrine where the greatest of Englishmen are buried.

### II. The Measure of Christian Progress in Matters not Reducible to Statistics.

(i.) *The Alleged Decline of Christian Influence.*—In estimating the present position and prospects of the Christian religion, it is necessary to refer to matters which are regarded by its friends and foes as tokens of its declining influence.

First, it is said that there are signs that Christianity has lost, or is losing, its moral influence. Ordinances and institutions which owe their sanctity to Christian influence are no longer socially observed. The Sunday, for instance, is being slowly transformed into a day of pleasure. Still more significant, it is alleged, is the lowering of moral standards: that which was once regarded as harmful is now treated as legitimate; the increase of luxury has led many to treat indulgences as though they were necessaries; the wish to live according to a liberal scale, and after an easeful fashion, has stimulated a passionate eagerness for wealth, and the determination to have it has led to a disregard of the code of honour, while the possession of the good things of life, as they are called, has produced enervation of character; restlessness, born of ease, has destroyed steadiness of habit; and impatience of toil has driven men to seek riches in doubtful rather than in diligent methods. In these ways, it is said, the claims of the Christian life are subordinated to the interests of the moment.

Against this must be set the fact that the apprehensions which here find expression have been common in all ages; they cannot be accepted as evidence of the declining influence of Christianity without some more tangible evidence. Earnestness, ambitious of greater Christian consistency, is always alive to contemporary evils. "The Lord's day is become the devil's market day" was the complaint of a bishop in 1724. Immorality at the same time was considered to be so rampant that men said, "Our light looks like the evening of the world." It is thus that men who measure public manners by the measure of their philanthrophic desires will ever speak. But for the purpose of the scientific historian, contemporary morals must be measured by a comparison of facts and statistics, and not by the despondency of the good. When, therefore, we find a steady diminution in pauperism and crime, and a marked increase of longevity owing to a more careful regard for human life and its conditions of health and happiness, we shall see that the advance of moral improvement is steady and sure, even if not rapid enough to satisfy the desires of the good. The most wholesome sign, under these circumstances, is the dissatisfaction of the good, for it is the witness that the spirit of earnestness and devotion is still a powerful factor in social life. When we quit the warm realms of zeal and enter the cold sphere of statistics, we find that the progress of moral standards advances with slow but decisive foot. The percentage of crime is strikingly lower; the paupers are proportionately fewer; greater care for the condition of the poor indicates a more tender public conscience. Social ambitions among us are becoming more unselfish. The general moral sense is higher. Intemperance is now a disgrace; slavery is illegal, and would be impossible to any enlightened Christian society. The ethical principles of Christianity have been planted deep among our social ideas, and have revolutionized manners. In our judgment, whatever undesirable features remain as blemishes on our civilization, the standards of moral life are gradually improving, and this improvement is largely due to the prevailing force of Christian ethics.

Secondly, it is said that everywhere men are increasingly reluctant to identify themselves with the Christian religion. Many discard the outward forms of Christian worship; attendance at worship is declining; and, perhaps most startling of all, the number of those who join the ranks of the Christian ministry is steadily diminishing among all Christian denominations. This last fact is the one which Christian churches should face: a searching inquiry into the causes for the decline of candidates for the ministry of the Church would be of the greatest interest. Till such inquiry has been made we can only speculate upon causes. Among these the following have been suggested:—(*a*) The unsettled condition of theological opinion, due to the progress of historical criticism. This is probably one cause, and it has given rise to the question how far the Christian churches should relax the terms of subscription required by their ministers. There can be no doubt that many of the dogmas to which subscription is required are, if not obsolete, yet expressed in terms which are at least incongruous with modern ideas.

On the other hand, the results of recent criticism are at present felt to be less destructive than the criticism of two generations ago. (*b*) The Christian ministry is a severer test of religious earnestness to-day than it was in the days of our fathers. The increase of luxury has set the scale of living higher. To maintain the position of a simple gentleman is more costly than it was. The remuneration of the Christian minister has not kept pace with the growing expenses of life, but the demands upon his time and resources have increased. (*c*) There is a widespread feeling that there are other ways open to Christian zeal besides those of the stated ministry, and the number of those who devote their lives in independent fashion to works of Christian benevolence has greatly increased of late years.

On the whole, the argument that Christianity has lost, or is losing, influence ends probably in the conclusion that certain formal aspects of Christianity have less hold upon men than formerly, but the increase of the influence of the Christian spirit is great and growing. Whether the present tendencies will end in a fatal relaxation of Christian ordinances, or in a better-proportioned estimate of their value; whether the decline of attachment to certain formal aspects of Christianity will lead to a renunciation of some of its essential principles, or will bring about a federation or union of Christian churches, are questions of deep interest, but are outside the scope of the present inquiry. It is enough for us to indicate our belief that, however much there may be to deplore in modern life, there is no real ground for believing that the social and ethical influence of Christianity has declined or is declining in the world.

(ii.) *Christianity and Morals.*—Chiefest among those signs of progress is the influence of Christian ideas upon the principles, whether of law or custom, which now govern the world. It will no doubt always be a matter of controversy how much of the humane principles now accepted among civilized nations is due to education, experience, and evolution, and how much to direct Christian influence. Results are complex, and we must seek their ancestry in more than one line, but no reasonable person who reads the story of modern civilization can doubt that the slow acceptance of the principles taught by Christ has powerfully affected its development. "The great characteristic of Christianity," says Mr Lecky, "and the proof of its divinity, is that it has been the main source of the moral development of Europe." Only by degrees, indeed, have the principles of Christianity been accepted or, indeed, understood.

For example, take the matter of slavery. The habit of enslaving prisoners of war received its first check when the sense of Christian brotherhood created a strong feeling among Christian peoples against the enslavement of their fellow-Christians when taken prisoners. The Crusades, when Christian nations fought side by side against a pagan foe, no doubt served to strengthen this feeling of repugnance against such enslavement. By degrees, however, the sense of brotherhood extended; the family of Christ were not only those who called themselves by His name, but all those who were sharers of His redemption. To enslave a brother meant to enslave any man, for every man was a brother for whom Christ died. Thus the anti-slavery movement arose out of a better appreciation of the spirit of Christ; and Christian men were all along the inspiration of the movement. This example may serve as a type of many other humane movements which have imposed a sort of unwritten law upon the conscience of civilized nations.

What is called international law, for instance, has in one sense no real existence. Nations have not yet accepted any definite written code of laws by which they are content to abide; but the broad and popular maxims, which expressed the Christianized feeling of mankind, became the basis of various erudite and influential works which may, broadly speaking, be called treatises on international law. Grotius, for example, definitely proclaimed that his book *De Jure*, &c., was an endeavour to present in orderly and codified form the customs and maxims which had grown out of the appreciation of Christian principles.

It has often been stated, and arguments have been founded on the statement, that Christianity laid down no rules respecting some of the great evils of the world—such as the status of women, slavery, and war. This is true, for Christianity is not a religion of rules, but a religion of principles; it is the introduction into human life of a new spirit, and that spirit is love. The improvements in the condition of the world, the spreading abroad of humaner principles of conduct, including humaner methods of war, are little more than the apprehension of the principles laid down by Christ and expressed by the apostolic declaration—"Love worketh no ill to his neighbour." The width of the application of the principle was made plain by Christ when He answered the question, "Who is my neighbour?" by the parable of the good Samaritan. The indications of the recognition of these principles mark stages in the history of civilization. Alcuin noted the influence of Christian principles in the treatment of slaves. Under the sceptre of Charlemagne an abhorrence of needless bloodshed gained hold upon the public mind, while in more modern times the Red Cross Society and the Geneva Convention have assuaged the horrors of the battlefield. The substitution of arbitration for war belongs to the future, but great progress has been made in the direction of peaceful solutions of international difficulties. The subject enlists Christian and humane sympathy in an increasing degree. The conference of bishops of the Anglican Church in 1897 directed attention to it, and issued a report which showed how largely both the idea and practice of arbitration had become familiar to the civilized world.

The changed conditions of modern life present, no doubt, new problems and new difficulties. There are some who despair of the application of Christian principles to the political and social questions which confront our times; but such persons overlook both the progress which has already been made, and also the fact that many of the problems which confront us to-day—*e.g.*, the industrial problems—are problems of recent growth, which owe their existence to the rapid commercial and political changes of the 19th century. Meanwhile the remarkable widening of the direction of Christian energy, of which we shall speak later on, shows that Christian public opinion is not likely to rest satisfied with a half-hearted application of the teaching of Christ, and that, whether ultimately successful or not, there is not a department of public life, nor a phase of human need or suffering, which the Christian conscience will allow to remain outside the reach of the Christian spirit.

The widened sweep of Christian energy is evidenced in the expanded conception of missionary effort. Missionary societies have almost universally enlarged the sphere of their work—the elevation of woman, ministry to the sick, the amelioration of social conditions enter into the aim of the missionary. Time and space forbid our discussing these at length, but two or three examples will make clear how closely allied the introduction of gentler or humaner customs are with the preaching of Christianity. The Christian missionary has been influential in bringing about the mitigation, if not the cessation, of cruel popular customs like suttee and infanticide.

(α) *Suttee.*—Among the changes for the better which the 19th century witnessed was the abolition of suttee or sati, *i.e.*, the self-destruction of the widow on the grave or funeral pyre of her husband. This was viewed in India as a virtuous or good act; hence its name, Sati, from a root signifying good or pure. The good or loyal wife was expected to follow her husband beyond the grave, to minister to him in the unseen. The custom prevailed almost universally in India in the beginning of the 19th century. In 1817 on an average two widows were burned daily in Bengal alone. In 1829 Lord William Bentinck declared the practice criminal. The English Government, in spite of many petitions declaring the religious character of the custom, supported Lord William Bentinck. The Christian Church led the way in this great reform. The agitation against the custom was begun by Carey, the missionary, in 1801. The extent of the benefit of the change may be judged when it is remembered that there are (1895) upwards of 22 millions of widows in India, all of whom would have been doomed by this cruel custom to a premature death, and more than 70,000 of these mere children under ten years of age.

(β) *Infanticide.*—This was, and still is, largely prevalent in China, but Christian influence has reduced the practice, and Christian philanthropy, by providing orphanages, has rescued numbers of children from an early death. One missionary tells us that at Amoy there was a pond in the town known as the babies' pond; into it babies were flung by their mothers, the little bodies were seen floating in the water, and the inhabitants looked on with indifference. Christian teaching rendered the practice less popular; the pond is now dried up, while foundling institutions provide for some 2000 children in the district. This is one illustration among many. Infanticide is practised in India. In the judgment of one writer, at the lowest estimate fully one-third of the girls born among the natives are still secretly murdered (Houghton, *Women of the Orient*, p. 71; Dennis, vol. i. p. 133). In Formosa and in the Pacific Islands the same custom prevails; in the latter not less than two-thirds of the children were put to death. Against this cruel custom the missionary exercises a restraining influence. Our churches, said an agent, are practically anti-infanticide societies.

(γ) *General Beneficence.*—But Christian energy has not confined its influence to the mitigation of great evils. It has become the minister of active benevolence. Orphanages and asylums spring up in missionary stations as well as hospitals and dispensaries, and on the staff of missionary societies are now found a certain proportion of medical missionaries. These are, if we mistake not, the product of the 19th century. It is safe to say that not a single medical missionary existed in any part of the heathen world a century ago; now there are no fewer than 217 in China alone. Evidence of the widespread humanizing influence of such agencies may be gathered from the fact that in a single year in the province of Shantung 200,000 cases were treated (*Methodist New Connexion Missionary Report*, 1900, p. 34). Much prejudice existed at first in the minds of Christian people. The undertaking of medical work appeared to them likely to interfere with the more distinctively religious aims of the missionary, but this feeling has almost entirely disappeared; and since Dr S. F. Green, a young American Presbyterian, went out (1847) to Ceylon, the value of the medical missionary has been recognized, and there are few missionary societies who have not some fully qualified doctors upon their staff. To take an example, the Church Missionary Society employs more than 50 medical missionaries, and the number of patients treated in one year (1900) was—of in-patients, 11,557; and of out-patients, 641,006.

(iii.) *The Happier Relations between Scientific and Religious Thought.*—There has been a marked change in the general feeling of the Church towards what is loosely called Science. Broadly speaking, we may say that the attitude of irreconcilable hostility on the part of the Church has almost entirely disappeared. The intelligent part of the Church has now consented to give to science the things which are science's. It is recognized that there is no part of the world of phenomena on which science has not a right to speak and to be heard. We must, however, remember that this is only a rough general estimate, and represents rather the existence of an altered feeling than an exact measurement of results. The improved feeling, it must be allowed, is due both to the larger and more scientific spirit which has pervaded Christendom, and also to the more reverent spirit which has characterized scientific inquiry. The contemptuous spirit of arrogant unbelief has passed away from scientific circles; the widening range of knowledge has left room for wonders which a narrower age of science would have scorned; there is scope for the play of activities undreamed of half a century ago. Among the best circles of scientific and Christian thought the dogmatic temper has given place to the spirit of the historical investigator. The statement must not be taken too widely. The dogmatic temper is still uppermost in some questions of the Church. The infallibility which is so dear to the religionist has fostered this dogmatic temper, and alike among the unenlightened advisers of the Vatican and in the circles of evangelical ignorance the voice of knowledge is refused and its messengers are cast out.

On the whole, however, everywhere except in such strongholds of idolized ignorance a calmer and more equable spirit possesses Christendom. It is recognized that the so-called conflict between science and religion never truly existed; the conflict was seen to be a battle between certain theological opinions and some conclusions of science. It was seen that in some cases the conclusions of science had been misunderstood, and in more cases the theological opinions were in no way parts of essential Christianity, but were rather doubtful inferences, stated in forms incidental to a particular epoch. The wide admixture of error with truth, the facility with which mistaken deductions were accepted as of equal authority with primary principles, and the diverse measures applied to language by scientific and theological thinkers were recognized; and with this recognition the most potent factors of dispute disappeared and a happier epoch alike for science and theology was inaugurated. As marks of the changes we have spoken of we may notice the totally different way in which the essays in *Lux Mundi* were received from the way in which *Essays and Reviews* were met by an earlier generation, and the significant difference between the titles of two books—one published in 1860 and the other in 1889—both dealing with the relations of science and Christianity. Mr Draper called his book the *Conflict between Science and Religion*. Dr Andrew White called his far abler and more judicious work, *The Conflict of Science and Theology*. One reason for the happier spirit which now prevails probably lies in the conviction that the battle for intellectual freedom has been finally won. No investigator now needs to veil his conclusions in a demoralizing ambiguity or to apologize for pursuing truth. Simultaneously with this secured position of the scientific inquirer there came faster to the world—and the fact is most significant—treatises on behalf of faith from the studies and laboratories of men of science.

The prevalence of this happier spirit has brought about a more wholesome and benevolent view of non-Christian beliefs. The science of comparative religion has been of service here. The faiths of the world have been investigated in a calm and impartial spirit. No thoughtful Christian man would use the language which was common fifty or sixty years ago when speaking of the creeds of other lands. The elements of truth in other creeds are now sought for; crude forms of worship are no longer looked upon as half hypocritical; Mahommed is no longer denounced as an impostor. This more temperate view of other men's creeds has naturally been followed by a great tenderness of spirit, and in some quarters the fear has been expressed that this tenderness may give rise to a kind of indifference in matters of faith. It is probable that, in their effort to do justice to heathen religions, some writers have overlooked or minimized the grave moral and social evils which are inextricably woven up with low theological ideas; but, nevertheless, on the whole it is remarkable that the generation which has learned to look with kindlier eyes upon other religions coincides with the generation which has shown the most ardent missionary

enthusiasm. The truth seems to be that the result of calm investigation has brought out into clearer relief the true significance and the moral and spiritual superiority of Christianity. Men in separating their thoughts of Christianity from the symbols of the churches, and in forming through the witness of their creeds clearer conceptions of human need, have been able to realize alike the simplicity and the marvellous fitness of Christianity to promote the elevation of human character, and thus they are able to recognize Christianity as a great evolutionary force in human history.

(iv.) *The Question of Reunion.*—The progress of Christianity has, in the view of many, been hindered by the numberless parties and organizations into which it has been divided. It is possible, however, that those who regard the divisions of Christendom with dismay may have overlooked the possible advantages of the conditions which they deplore. Apart from the energy which rivalry may stimulate, it must not be forgotten that only by the recognition of such divisions could some of the most precious of human inheritances have been preserved. Religious freedom, the shield and guardian of intellectual integrity in matters of faith, was purchased at the price of division. The endeavour to preserve union by external pressure failed, and it is now realized that the outward union of Christendom must begin with the promotion of an inward harmony. The prospects of a great external reunion of Christendom involve questions too large to be discussed here. It may, however, be well to notice that there are in recent times features, unfavourable as well as favourable, to the hopes of reunion. The stiffening of the attitude of the Roman Catholic Church which has been noticeable since the declaration of infallibility; exaggerated or mistaken ecclesiastical conceptions favoured by certain schools of thought; the tendency to treat variations of custom as transgressions of an imaginary divine law; the creation of new sins, of which denominationalism is only too fruitful: these and other features of modern Christianity are unfavourable to reunion. On the other hand, the development of a passionate yearning for reunion which has found voice all the world over; the frank recognition of the disastrous results of division, especially in the modern mission field; the growth of the practical, and the decay of the dogmatic spirit, are all favourable. Meanwhile the desire for reunion has not been confined to empty wishes. Practical steps have not been wanting. The fusion of two important bodies in Scotland—the Free Church and the United Presbyterian Church—is perhaps the most remarkable example of successful negotiation. Other negotiations are in process, and in Scotland devout men are working for a better understanding between the Church of Scotland and the Scottish Episcopal Church. Complete reunion is as yet far off, but some concordat or federation among the churches of the Reformation is a vision which many good and wise men cherish as neither unreasonable nor impossible. In the view of many the existence of common work carried on by interdenominational societies is calculated to show that some such federation may be legitimately and hopefully desired, if not expected.

The strength of the practical and individual movements in Christendom is illustrated in what follows.

### III. The Measure of Christian Progress in the Light of certain Altered Conditions.

Modern life, and what is called the modern spirit, have altered the conditions of Christendom. Men can more clearly measure the relation of Christian churches to one another; they can more clearly see their duty to the world. The scientific spirit has helped to reduce to their fitting proportion many matters which were once deemed of primary importance. Questions which former ages discussed are not left untouched; theological acrimony, if not extinct, does not cover the same field as before. The dogmatic temper has given way to a kindlier and more practical spirit, and we are able to measure the progress of Christianity by the aspirations which are now cherished, and by the change of Christian methods in practical, personal, and co-operative directions.

(i.) *The Growth of the Practical Spirit.*—There has been a marked change in ideals in recent times, and the change has mainly been in the very strong preference for work which, for distinction's sake, we may call practical. It is needful, perhaps, to explain what is meant: the energies of Christian bodies were in the main directed in former years to work which was almost exclusively ecclesiastical and controversial—*i.e.*, the members of different Christian societies or churches endeavoured to enlarge the borders of these societies by bringing in those who were careless in life or hostile in creed. There was, if we may use the phrase, a certain egotistic flavour about their work; and they were satisfied if they could maintain their own services, and bring in some aliens into their fold. Of recent years men have been desirous of wider and more practical benevolence; they have not merely wished to bring men into their church; they sought to carry the power of Christian influence and of the Christian spirit among men. They have looked at the great world, and they have been filled with the practical compassion which has prompted the inquiry, "What can we do for them?" The result has been the development of a vast amount of practical activity, more or less unrelated to the dogmatic restraints of former times. This spirit of practical Christianity has found expression in a variety of organizations—in societies, guilds, brigades, institutes, and what are known as settlements. The "settlement" means the residence in the very centre of the poorer quarters of great cities of men and women who are ready to labour—not always on distinctly or distinctively religious lines—among the needy and uncultivated classes. The aim is to bring culture, knowledge, harmless recreation, and above all, personal influence, to the very doors of the neglected. The watchword of such settlements is personal service. A young Oxford man, brilliant and devoted, Arnold Toynbee by name, has the credit of leading the way in this class of beneficent work; at all events, it was his name that was given to the Hall in Whitechapel which, under the fostering care and influence of the Rev. S. A. Barnett, was the first material embodiment of the movement. Since his time many settlements of the same or similar nature have sprung up in Great Britain and America. Young men at the universities were found to sympathize with this class of movement; and now there is in London an Oxford house, a Cambridge, an Eton, and a Harrow mission, besides many others, which act as channels for the guidance and employment of Christian or philanthropic energy. Some of these—indeed, many—are now in connexion with some one or other of the kindred bodies; but the general features of all these settlements is the recognition of any practical work calculated to minister to the cultivation and happiness of the too long neglected classes. The practical spirit shows itself also in the formation of guilds, camps, and institutes. Lads and girls, and even children are gathered together; efforts are made to organize for them not only educational and religious opportunities, but harmless recreation—holidays and excursions are arranged, games are provided, and devoted men and women identify themselves in kindly and sympathetic fashion as partners in these recreations and sharers in these games. Almost universally the influence of Christian people has been drawn into channels which an earlier generation

would have regarded as somewhat too secular to be worthy of Christian zeal. Societies like the Kyrle Society have sprung up, and endeavoured to brighten and beautify the life of the poor. The very remarkable movement known as the Salvation Army (*q.v.*) came under the influence of the practical spirit we are speaking of, and the social side of its work has been in some respects its most successful and satisfactory achievement.

The signs of this practical spirit meet us on all sides—at home in orphanages and asylums; abroad in dispensaries, medical missions (of which we have spoken), and leper settlements. Looking at these facts, observers of history have pointed out that the guiding force of Christian life has passed through the hands of various races. The Hebrew race gave it inspiration, the Greek gave it intellectual expression, the Roman gave it opportunity of world ascendancy, the Teutonic intensified its spiritual individualism, and the Anglo-Saxon race is now giving to it wide and varied practical application. However this may be, the practical work is now multitudinous and its development rapid. Toynbee Hall, the first of the settlements, was started in 1885; and there are now more than 70 such establishments in existence—35 in the United States; the resident workers in these are reckoned to be at least 300. It would be impossible to chronicle all the forms in which the practical energy displays itself. It is enough to notice that it includes reformatories, homes for waifs and strays, rescue societies, inebriates' homes, charity organizations, nursing institutions for the sick poor, holiday funds, boys' brigades, working men's clubs, reading rooms, athletic associations, homes for working girls, newspaper boys, bootblacks, drift children's missions, and others too numerous to mention. The work, though mainly directed towards the poor, does not overlook the wealthier classes: the sea-side camps and public school missions are evidence of this fact.

(ii.) *Individualism in Work.*—The practical direction of Christian activity has been accompanied by a great outburst of free and individual effort. The various Christian bodies have their agencies and societies for practical work, but one feature of modern Christian enthusiasm is its strong and marked individualism. Many of the most remarkable and successful efforts of practical energy have been due to individual rather than ecclesiastical initiative. Mr Müller's work at Bristol, Mr Quarrier's in Scotland, Dr Barnardo's in London, the enormous and world-wide organizations known as the Young Men's Christian Association, the Christian Endeavour Society, the St Andrew's Brotherhood, all owe their beginning to personal devotion.

(iii.) *Interdenominational Movements.*—There is a certain quantity of Christian energy and force which does not seem able to work through existing organizations. It is not for us to suggest reasons—we can only chronicle results. It may be that the advance of critical thought has made it impossible for certain minds to accept the real or supposed theological bondage of the churches, and that, as a consequence, a considerable portion of Christian and philanthropic earnestness has escaped into other channels; it may be that the discords or jealousies of the denominations have alienated certain ardent natures; but however this may be, there is no doubt of the great increase of independent and undenominational religious and humanitarian work.

IV. Conclusion.

The present force of Christianity in the world is the result of a steady growth in numbers and influence. The religion which was the religion of an obscure handful of men is now, after a lapse of nineteen hundred years, the religion of a third of the human race and by far the most vigorous and influential nations. Further, the religion which took its rise among the Semites has become the religion of the most powerful branch of the Aryan family; and, lastly, the race which is possessed of the greatest power of expression, the keenest sense of liberty, which possesses the freest institutions and the most marked individuality, is the race which includes the churches of the Reformation. It is in this race of strongly marked individuality that, as might be expected, the largest variety of denominations is to be found. These divisions are partly a strength and partly a weakness; in the past they have been of service in preserving intellectual independence, liberty of conscience, and religious toleration. It may be doubted, however, whether, now that the cause of freedom has been won, these divisions may not be a source of growing weakness, but against any possible ill results must be set the unifying influences now at work, the desire for reunion, the pressure of political circumstances, and the experiences of missionary enterprise. The modern spirit, moreover, if we may use a vague but useful term, tends to treat ecclesiastical and dogmatic differences as matters of lessening importance. The value of denominational barriers is depreciated in public esteem. With larger views of life and nature, of the world's history and of human interests, the minds of men are seeking the common principles on which the denominations are united, and are willing to minimize matters of difference. There is arising a powerful religious movement which is bent on service and not on controversial theology. Vast organizations on this basis are appearing in all parts of the world. In the view of some these non-denominational organizations are the seminal principles of the future Christian brotherhood—the church of the latter days—destined to grow larger and more vigorous while the more formal ecclesiastical systems slowly wither away. These are conjectures. The simple and striking fact which meets our view is not merely the widespread character of Christianity, but the marvellous way in which the forces and influences of the world are gathered into the hands of Christian nations.

(W. B. R.)

**Christian Science,** a system of theosophic and therapeutic doctrine, which was originated in America about 1866 by Mrs Mary Baker Eddy, of Lynn, Massachusetts, and has in recent years obtained a number of adherents both in the United States and in European countries. Mrs Eddy based her teaching on the Bible, and on the principles that man's essential nature is spiritual, and that the Spirit of God being Love and Good, moral and physical evil are contrary to that Spirit, and represent an absence of the True Spirit which was in Jesus Christ. There is but one Mind, one God,

one Christ, and nothing real but Mind. Matter and sickness are subjective states of error, delusions which can be dispelled by the mental process of a true knowledge of God and Christ, or Christian science. Jesus himself healed by those means, which were therefore natural and not miraculous, and promised that those who believed should do curative works like his. About the year 1867 Mrs Eddy came forward as a healer by Mind-cure, and rapidly obtained fellow-workers and students. In 1876 a Christian Scientist Association was organized. Mrs Eddy had published in the preceding year a book entitled *Science and Health, with Key to the Scriptures.* In 1879 she became the pastor of a "Church of Christ, Scientist" in Boston, and also founded there her "Massachusetts Metaphysical College" for the purpose of medical instruction. In 1883 she started an official organ of her teaching, *The Christian Science Journal.* The first denominational chapel was built at Oconto, Wisconsin, in 1886; and in 1894 a great memorial church was erected in Boston. Mrs Eddy's publications also include *Retrospection and Introspection* (1891), *Unity of Good and Unreality of Evil* (1887), *Rudimental Divine Science* (1891), *Christian Healing* (1886).

**Christiania,** the capital of Norway, forming a county (*amt*) to itself, and situated on the Aker river, at the head of Christiania Fjord, in 59° 54′ 44″ N. lat. and 10° 43′ 28″ E. long. During the second half of the 19th century the city grew rapidly, many buildings of wood giving place to structures of brick or stone. New suburbs, spread over a wide area, were built on the rising ground to the west and north-west, around and beyond the royal park. This rapid expansion was due for the most part to the increase in the population. It was also due in part to the advance which the people made in material prosperity. For instance, in the ten years ending with 1898 it was estimated that the gross value of the property owned in Christiania had increased by 68 per cent. and the gross value of the incomes of the inhabitants by 83 per cent. In the year 1898 alone the gross value of the property was estimated to have risen from $17\frac{1}{4}$ millions sterling to nearly $20\frac{1}{4}$ millions sterling, and the gross value of the incomes from 4 millions to over $4\frac{1}{2}$ millions sterling—remarkable figures for a place of only 200,000 inhabitants. The university, which had in 1897 some 60 professors and 1200 students (1600 in 1889), embraces five faculties (theology, law, medicine, history and philology, mathematics and natural sciences), and possesses several valuable collections—a library of 350,000 vols.; museum of Norse antiquities, especially rich in objects of the Viking age, including two ancient viking ships; an ethnographical museum, a numismatic collection, a cabinet of minerals, a botanical collection, and a zoological collection. In 1899-1900 a large historical museum was built to shelter the Norwegian National Museum, the museum of northern antiquities, and certain of the university collections. Other buildings deserving mention are the national theatre (1899); the sculpture museum (1882), an Italian Renaissance building; the industrial arts museum (1876); the new Freemasons' lodge (1894), one of the handsomest structures in the city; and a conservatory of music (1883). The city is tolerably well adorned with monuments to distinguished Norwegians—Wergeland, Asbjörnsen, Eilert Sundt, Schweigaard, Kjerulf, besides King Christian IV. and others.

On the east side of the river Aker is the suburb of Oslo, with the existing episcopal palace, and an old bishop's palace, in which James VI. of Scotland (I. of England) was betrothed to Princess Anne of Denmark. In the environs of the city are the royal pleasure castle of Oscarshal (1847-52), on the peninsula Bygdö (Ladugaard) to the west of the city, with a historical museum (1881), and some ancient churches and houses brought there from different parts of the country. On Hovedö (Head Island) in the fjord, immediately opposite to Akershus (not Agershus), are the ruins of a Cistercian monastery, founded in 1147 by monks from Kirkstead (Lincolnshire), and burnt down in 1532. Then there are the pleasure resorts of St Hans Haugen (150 ft.), Frognersæter (1362 ft.), Holmenkollen sanatorium (1116 ft.), where the famous *ski* (snow-shoe) races are held in February, and Voksenkollen sanatorium (1650 ft.), opened in 1900.

Christiania is a place of considerable industrial activity, which developed rapidly in the last two decades of the 19th century. Except for two large shipbuilding yards, one with a floating dock, the other with a dry dock, most of the manufactories are concentrated in the suburb of Sagene, on the north side of the city, deriving their motive power from the numerous falls of the river Aker. They embrace factories for cotton and woollen spinning and weaving, paper, flour, soap and oil, bricks and tiles, matches, nails (especially horse-shoe nails), margarine, foundries and engineering shops, wood-pulp, tobacco, matches, linen, glass, sail-cloth, hardware, gunpowder, chemicals, with sawmills, breweries, and distilleries. In 1898 there were 375 factories at work in Christiania, and they employed 17,383 hands. There is also a busy trade in the preparation of granite paving-stones, and in the storing and packing of ice. From about the middle of the 19th century Christiania has been the principal emporium of South Norway, and has long since far outstripped Bergen in the volume of its commerce. The total value of the trade of the port increased from £4,958,600 (imports, £3,862,000; exports, £1,096,600) in 1872, to £5,492,000 in 1882, to £7,738,000 in 1892, and to £8,567,200 in 1898. The imports are more than four times the exports in respect of value, the figures for 1898 being £7,987,600 and £1,579,600 respectively. The former consist principally of grain and flour (£550,000 to £650,000), woollens (£450,000 to £550,000), coffee (£425,000 to £475,000), iron—raw and manufactured (£750,000 in 1898; £367,000 in 1894), cottons (£350,000 to £400,000), coal (£250,000 to £275,000), bacon and salt meat (£250,000 to £275,000), oils (£175,000 to over £250,000), sugar (£185,500 to £230,000), machinery (£362,000 in 1898; £149,000 in 1894), flax, jute, and hemp, paper-hangings, paints, colours, &c., wines and spirits, raw tobacco, copper, zinc, lead, and tin, silk, molasses, and other commodities. The principal exports are wood-pulp (£225,000 to £325,000), timber (£155,000), nails, paper, butter and margarine (£103,000), matches, condensed milk, fish, leather and hides, ice, sealskins, &c. Of the imports, Great Britain supplies the greater part of the cotton and woollen yarn, the machinery (including ships), and the raw metals; the United States about one-half of the oils and fats, and a large proportion of the food-stuffs, and skins, feathers, &c. Of the exports, almost the whole of the timber goes to Great Britain, together with the larger portion of the paper and food-stuffs (butter, &c.). In 1872 the port was entered by 1787 vessels of 393,600 tons burden; in 1891 by 2078 vessels of 817,800 tons; and in 1899 by 2710 vessels of 1,000,740 tons. Although Christiania owns a smaller merchant fleet than Bergen, her shipping increased from 264 vessels of 104,000 tons in 1881 to 401 vessels of 206,150 tons in 1892, and to 398 vessels of 380,525 tons in 1900. Early in 1899 the municipality voted £47,000 for the construction of a pier, a harbour for fishing-boats, protected by a mole and a quay, 345 ft. long, on the shore

underneath the fortress of Akershus. These works are intended to be the first in a general rearrangement of the entire harbour of the city. Population (1885), 128,301, counting in the suburbs; (1891), 151,239; (1898), 203,337, of whom 93,695 males, 109,642 females; (1900), 225,686.

**Christiansand,** a fortified seaport town of Norway, on the S. coast. It is an important port of call for the Baltic steamboats, and a fishing centre. It was burnt down in 1892, and subsequently rebuilt of brick. It exports timber (nearly 3 million cubic feet annually), wood-pulp, paper, fish, and felspar. The total trade is under half a million sterling. Christiansand owns about 100 vessels of 52,000 tons. An impetus was given to the trade and tourist traffic by the opening of the Sætersdal railway, tapping the interior, in 1895-96. Sawmills, wood-pulp factories, shipbuilding yards, and mechanical workshops are the principal industrial works. The cathedral was rebuilt after a fire in 1880. Population (1875), 11,766; (1900), 14,007.

**Christianstad,** a fortified town of Sweden, on a peninsula which juts out into Lake Sjövik, an expansion of the river Helge, 10 miles from the Baltic and 66 miles E. from Helsingborg by rail. It is the headquarters of several railway companies, and has flour mills, engineering works, distilleries, a weaving mill, sugar factory, &c., and exports granite and wood-pulp, and imports coal (40,000 to 70,000 tons), and wheat and rye. In 1896-97 its harbour at Ahus (pop. 1547) was enlarged and deepened to admit vessels drawing 18 ft., and a new entrance channel made. In 1899 it was entered by 530 vessels of 100,150 tons. A new town hall was built in 1889. Population (1880), 9203; (1900), 10,318.

**Christiansund,** a seaport town of Norway, co. Romsdal, 83 miles W.S.W. from Trondhjem. It exports cod-fish, herrings, cod-liver oil, fish manure, &c., to the annual value of £350,000 to £550,000, and imports salt, coal, and colonial wares to about £55,000. Since 1894 butter has been exported to Great Britain. In 1892 an outlook tower was erected to commemorate the 150th anniversary of the founding of the town. Population (1875), 8251; (1898), 11,68

**Christina, Maria Christina Henrietta Désirée Félicité Rénière,** QUEEN-REGENT OF SPAIN (1858- ——), widow of Alfonso XII. and mother of Alfonso XIII., was born at Gross Seelowitz, in Austria, on 21st July 1858, being the daughter of the Archduke Charles Ferdinand and the Archduchess Elizabeth of Austria. She was brought up by her mother as a rigid Catholic, and great care was taken with her education. At eighteen she was appointed, by the Emperor Francis Joseph, abbess of the House of Noble Ladies of Saint Theresa in Prague, where she made herself very popular and distinguished herself by her intellectual parts. It is said that at the Court of Vienna the archduchess saw the young Prince Alfonso of Spain when he was only a pretender in exile, before the restoration of the Bourbons. A few years later, when Alfonso XII. had lost his first wife and cousin, Queen Mercedes, daughter of the duc de Montpensier, his ministers, especially Señor Canovas, urged him to marry again. He told them that if he did so it would only be with the young Austrian Archduchess Maria Christina. After some negotiations between the two Courts and Governments, it was agreed that the Archduchess Elizabeth and her daughter should meet Alfonso XII. at Arcachon, in the south of France, where a few days' personal acquaintance was sufficient to make both come to a decision. The duke of Bailen went officially to Vienna to get the emperor of Austria's authorization, and on 14th November 1879, in the throne-room of the Imperial palace, the archduchess solemnly abdicated all her rights of succession in Austria, in accordance with the law obliging all princesses of the Imperial house to do so when they wed a foreign prince. On 17th November the archduchess and her mother, with a numerous suite, started for Spain, arriving at the royal castle of El Pardo, near Madrid, on 24th November. The wedding took place in the Atocha cathedral, on 29th November, in great state, and was followed by splendid festivities. Queen Christina bore her husband two daughters, before he died in 1885—Dona Mercedes, born 11th September 1880, and Dona Maria Theresa, born 12th November 1882. During her husband's lifetime the young queen kept studiously apart from politics, so much so that her inexperience caused much anxiety in November 1885, when she was called upon to take the arduous duties of regent. During the long minority of the posthumous son of Alfonso XII., the present King Alfonso XIII., the Austrian Queen-Regent acted in a way that obliged even the adversaries of the throne and the dynasty to respect the mother and the woman. The people of Spain, and the ever-restless civil and military politicians, found that the gloved hand of their constitutional ruler was that of a strong-minded and tenacious regent, who often asserted herself in a way that surprised them much, but always, somehow, commanded obedience and respect. More could not be expected by a foreign ruler from a nation little prone to waste attachment or demonstrative loyalty upon anybody not Castilian born and bred.

**Christinehamn,** or KRISTINEHAMN, a town of the province of Vermland, Sweden, near the N.E. corner of Lake Wener, 25 miles by rail E. by S. from Carlstad. It has ironworks, a tobacco factory, &c., and large fairs are held every April and October. A part of the town was burnt down in 1893. Population (1880), 5039; (1900), 6775.

**Christison, Sir Robert,** BART. (1797-1882), Scottish toxicologist and physician, was born in Edinburgh on 18th July 1797. After graduating at the university of that city in 1819, he spent a short time in London, studying under Abernethy and Lawrence, and in Paris, where he learnt analytical chemistry from Robiquet and heard lectures by Orfila, the famous toxicologist. In 1822 he returned to Edinburgh as professor of Medical Jurisprudence, and set to work to organize the study of his subject on a sound basis. On poisons in particular he speedily became a high authority; his well-known book on them was published in 1829, and in the course of his inquiries he did not hesitate to try such daring experiments on himself as taking large doses of Calabar bean. His attainments in medical jurisprudence and toxicology procured him the appointment, in 1829, of medical officer to the Crown in Scotland, and from that time till 1866 he was called as a witness in many celebrated criminal cases. In 1832 he gave up the chair of Medical Jurisprudence and accepted that of Medicine and Therapeutics, which he held till 1877; at the same time he became professor of Clinical Medicine, and continued in that capacity till 1855. His fame as a toxicologist and medical jurist, together with his work on the pathology of the kidneys and of fevers, secured him a large private practice, and he succeeded to a fair share of the honours that commonly attend the successful physician, being appointed physician to Queen Victoria in 1848 and receiving a baronetcy in 1871. Among the books which he published were a treatise on *Granular Degeneration of the Kidneys* (1839), and a *Commentary on the Pharmacopœias of Great Britain* (1842). Sir Robert Christison, who retained remarkable physical vigour and activity

down to extreme old age, died at Edinburgh on 23rd January 1882.

**Christmas Island,** a British possession under the government of the Straits Settlements, situated in the eastern part of the Indian Ocean (in 10° 25′ S. lat., 105° 42′ E. long.), about 190 miles S. of Java. It is not known when and by whom the island was discovered, but under the name of *Moni* it appears on a Dutch chart of 1666. It was first visited in 1688 by Dampier, who found it uninhabited. In 1886 Captain Maclear of H.M.S. *Flying Fish*, having discovered an anchorage in a bay which he named Flying Fish Cove, landed a party and made a small but interesting collection of the flora and fauna. In the following year Captain Aldrich on H.M.S. *Egeria* visited it, accompanied by Mr J. J. Lister, F.R.S., who formed a larger biological and mineralogical collection. Among the rocks then obtained and submitted to Sir John Murray for examination there were detected specimens of nearly pure phosphate of lime, a discovery which eventually led, in June 1888, to the annexation of the island to the British Crown. Soon afterwards a small settlement was established in Flying Fish Cove by Mr G. Clunies Ross, the owner of the Keeling Islands, which lie about 750 miles to the westward. In 1891 Mr Ross and Sir John Murray were granted a lease, but on the further discovery of phosphatic deposits they disposed of their rights in 1897 to the company now in possession. In the same year a thorough scientific exploration was made, at the cost of Sir John Murray, by Mr C. W. Andrews, of the British Museum.

*Physical Features and Geology.*—The island is a quadrilateral with hollowed sides, about 12 miles in greatest length and 9 in extreme breadth. It is about 190 miles from the nearest land, and is probably the only tropical island that had never been inhabited by man. When the first settlers arrived, in 1897, it was covered with a dense forest of great trees and luxuriant undershrubbery. The settlement in Flying Fish Cove now numbers some 250 inhabitants, consisting of Europeans, Sikhs, Malays, and Chinese, by whom roads are being cut and patches of cleared ground cultivated. The island is the flat summit of a submarine mountain more than 15,000 feet high, the depth of the platform from which it rises being about 14,000 feet, and its height above the sea being upwards of 1000 feet. The submarine slopes are steep, and within 20 miles of the shore the depth of the sea reaches 2400 fathoms. It consists of a central plateau descending to the water in three terraces, each with its "tread" and "rise." The shore terrace descends by a steep cliff to the sea, forming the "rise" of a submarine "tread" in the form of fringing reef which surrounds the island and is never uncovered, even at low water, except in Flying Fish Cove, where the only landing-place exists. The central plateau is a plain whose surface presents "rounded, flat-topped hills and low ridges and reefs of limestone," with narrow intervening valleys. On its northern aspect this plateau has a raised rim having all the appearances of being once the margin of an atoll. On these rounded hills occurs the deposit of phosphate of lime which gives the island its commercial value. The phosphatic deposit has doubtless been produced by the long-continued action of a thick bed of sea-fowl dung, which converted the carbonate of the underlying limestone into phosphate. The flat summit is formed by a succession of limestones—all deposited in shallow water—from the Eocene (or Oligocene) up to recent deposits in the above-mentioned atoll with islands on its reef. The geological sequence of events appears to have been the following:—After the deposition of the Eocene (or Oligocene) limestone—which reposes upon a floor of basalts and trachytes—basalts and basic tuffs were ejected, over which, during a period of very slow depression, orbitoidal limestones of Miocene age—which seem to make up the great mass of the island—were deposited; then elapsed a long period of rest, during which the atoll condition existed and the guano deposit was formed; from then down to the present time there has succeeded a series of sea-level subsidences, resulting in the formation of the terraces and the accumulation of the detritus now seen on the first inland cliff, the old submarine slope of the island. The occurrence of such a series of Tertiary deposits appears to be unknown elsewhere. The whole series was evidently deposited in shallow water on the summit of a submarine volcano standing in its present isolation, and round which the ocean floor has probably altered but a few hundred feet since the Eocene age. Thus although the rocks of the southern coast of Java in their general characters and succession resemble those of Christmas Island, there lies between them an abysmal trough 15,000 feet in depth, which renders it scarcely possible that they were deposited in a continuous area, for such an enormous depression of the sea-floor could hardly have occurred since Miocene times without involving also Christmas Island. One of the main purposes of the exploration was to obtain light on the question of the foundation of atolls. As a result of the investigation it has been found that "the great thickness of reef limestone required by the Darwinian theory of atoll formation" does not exist, and "although there may be some evidence that subsidence did occur in the earlier history of the island, it is clear that it was neither continuous for any long period nor of any great extent" (*Andrews*). If Christmas Island cannot, perhaps, be proved to have been a typical atoll, it can, however, "be shown that at one time it must have consisted of reefs and islands approximating very nearly to those seen on atolls which are regarded as typical, and the determination of the nature of the foundation upon which those reefs and islands rested is, at least, a step in the right direction" (*Andrews*).

*Flora and Fauna.*—The flora consists of 129 species of angiosperms, 1 *Cycas*, 22 ferns, and a few mosses, lichens, and fungi, 17 of which are endemic, while a considerable number—not specifically distinct—form local varieties nearly all presenting Indo-Malayan affinities, as do the single *Cycas*, the ferns, and the cryptogams. As to its fauna, the island contains 319 species of animals—54 only being vertebrates—145 of which are endemic. A very remarkable distributional fact in regard to them, and one not yet fully explained, is that a large number show affinity with species in the Austro-Malayan rather than in the Indo-Malayan, their nearer, region. The ocean currents, the trade-winds blowing from the Australian mainland, and north-westerly storms from the Malayan islands, are no doubt responsible for the introduction of many, but not all, of these Malayan and Australasian species.

*Climate.*—The climate is healthy, the temperature varying from 75° to 84° F. The prevailing wind is the S.E. trade, which blows the greater part of the year. The rainfall in the wet season is heavy, but not excessive, and during the dry season the ground is refreshed with occasional showers and heavy dews. Malarial fever is not prevalent, and it is interesting to note that there are no swamps or standing waters on the island.

See ANDREWS, C. W. *A Monograph of Christmas Island (Indian Ocean)*, London, 1900, to which the present writer has been greatly indebted. (H. O. F.)

**Chronographs.**—In the article GUNNERY (*Ency. Brit.* vol. xi.) descriptions were given of some chronographs adapted for the determination of the velocities of projectiles. Some additional forms of instruments both for this and for other purposes are here described.

*Gun Chronographs.*—Probably the earliest forms of chronographs, not based on the ballistic pendulum method, are due to Colonel Grobert, 1804, and Colonel Dabooz, 1818, both officers of the French army.

In the instrument by Grobert two large discs, attached to the same axle 13 ft. apart, were rapidly rotated; the shot pierced each disc, the angle between two holes giving the time of flight of the ball, when the angular velocity of the discs was known. In the instrument by Colonel Dabooz a cord passing over two light pulleys, one close to the gun, the other at a given distance from it, was stretched by a weight at the gun end and by a heavy screen at the other end. Behind this screen there was a fixed screen. The shot cut the cord and liberated the screen, which was perforated during its fall. The height of fall was measured by superposing the hole in the moving screen upon that in the fixed one. This gave the approximate time of flight of the shot over a given distance, and hence its velocity.

In the early form of chronoscope invented by Wheatstone in 1840 the period of time was measured by means of a species of clock, driven by a weight; the dial pointer was started and stopped by the action of an electromagnet which moved a pawl engaging with a toothed wheel fixed on the axle to which the dial pointer was attached. The instrument applied to the determination of the velocity of shot is described thus by Wheatstone:—

"A wooden ring embraced the mouth of the gun, and a wire connected the opposite sides of the ring. At a proper distance the target was erected, and so arranged that the least motion given to it would establish a permanent contact between two metal points. One of the extremities of the wire of the electromagnet (before mentioned) was attached to one pole of a small battery; to the other extremity of the electromagnet were attached two wires, one of which communicated with the contact piece of the target, and the other with one of the ends of the wire stretched across the mouth of the gun; from the other extremity of the voltaic battery

two wires were taken, one of which came to the contact piece of the target, and the other to the opposite extremity of the wire across the mouth of the gun. Before the firing of the gun a continuous circuit existed, including the gun wire; when the target was struck the second circuit was completed; but during the passage of the projectile both circuits were interrupted, and the duration of this interruption was indicated by the chronoscope."

Professor Henry (*Journal Franklin Inst.*, 1886) employed a cylinder driven by clockwork, making ten revolutions per second. The surface was divided into 100 equal parts, each equal to $\frac{1}{1000}$ second. The time marks were made by two galvanometer needles, when successive screens were broken by a shot. Henry also used an induction-coil spark to mark the cylinder, the primary of the coil being in circuit with a battery and screen. This form of chronograph is in many respects similar to the instrument of Konstantinoff, which was constructed by Breguet and has been sometimes attributed to him (*Les Comptes Rendus*, 1845). This chronograph consisted of a cylinder 1 m. in circumference and 0·36 m. long, driven by clockwork, the rotation being regulated by a governor provided with wings. A small carriage geared to the wheelwork traversed its length, carrying electromagnetic signals. The electric chronograph signal usually consists of a small armature (furnished with a style which marks a moving surface) moving in front of an electromagnet, the armature being suddenly pulled off the poles of the electromagnet by a spring when the circuit is broken (*Journal of Physiology*, vol. ix. p. 408). The signals in Breguet's instrument were in a circuit, including the screens and batteries of a gun range. The measurement of time depended on the regularity of rotation of the cylinder, on which each mm. represented $\frac{1}{1000}$ second.

In the Navez chronograph (1848) the time period is found by means of a pendulum held at a large angle from the vertical by an electromagnet, which is in circuit with a screen on the gun range. When the shot cuts this screen, the circuit is broken and the pendulum liberated and set swinging. When the next screen on the range is broken by the shot, the position of the pendulum is recorded and the distance it has passed through measured on a divided arc. From this the time of traversing the space between the screens is deduced. By means of an instrument known as a disjunctor (*Ency. Brit.* vol. xi. p. 300) the instrumental time-loss or latency of the chronograph is determined. In Benton's chronograph (1859) two pendulums are liberated, in the same manner as in the instrument of Navez, one on the cutting of the first screen, the other on the cutting of the second. The difference between the swings of the two pendulums gives the time period sought for. The disjunctor is also used in connexion with this instrument. In Vignotti's chronograph (1857) again a pendulum is employed, furnished with a metal point, which moves close to paper impregnated with ferro-cyanide of potassium. The gun-range screens are included in the primary circuits of induction coils; when these circuits are broken a spark from the pointer marks the paper. From these marks the time of traverse of the shot between the screens is determined.

Colonel Sebert (*Extraits du Mémorial de l'Artillerie de la Marine*) devised a chronograph to indicate graphically the motion of recoil of a cannon when fired. A pillar fixed to the ground at the side of the gun-carriage supported a tuning-fork, the vibration of which was maintained electrically. The fork was provided with a tracing point attached to one of the prongs, and so adjusted that it drew its path on a polished sheet of smoke-blackened metal attached to the gun-carriage, which traversed past the tracing point, when the gun ran back. The fork used made 500 complete vibrations per second. A central line was drawn through the curved path of the tracing point, and every entire vibration cut the straight line twice, the interval between each intersection equalling $\frac{1}{1000}$ second. The diagram so produced gave the total time of the accelerated motion of recoil of the gun, the maximum velocity of recoil, and the rate of acceleration of recoil from the beginning to the end of the motion. By means of an instrument furnished with a microscope and micrometers, the length and amplitude, and the angle at which the curved line cut the central line, were measured. At each intersection (according to the inventor) the velocity could be deduced. The motion at any intersection being compounded of the greatest velocity of the fork, while passing through the midpoint of the vibration and the velocity of recoil, the tangent made by the curve with the straight line represents the ratio of the velocity of the fork to the velocity of recoil. If $a$ be the amplitude of vibration, considered constant, $v$ the velocity of the fork at the midpoint of its path, $r$ the velocity of recoil, $\alpha$ the angle made by the tangent to the curve with the straight line at the point of intersection, and $t$ the line of a complete vibration; then,

$$v=\frac{2\pi a}{t}; \quad r=\frac{v}{\tan \alpha}.$$

In Colonel Watkin's chronograph ("Chronographs and their Application to Gun Ballistics," *Proc. Roy. Inst.*, 1896) a metal drum, divided on its edge so that when a vernier is used a minute of angle may be read, is rotated rapidly by a motor at a practically uniform speed. The points of a r[illegible] pins, screwed into a frame of ebonite, can be [illegible] inch of the surface of the drum. Each pin is a part of the secondary circuit of an induction coil, the space between the pins and the drum forming spark gaps. The drum is rubbed over with a weak solution of paraffin wax in benzol, which causes the markings produced by the sparks to be well defined. The records are read by means of a fine hair stretched along the drum and just clear of it, the dots being located under the hair by means of a lens. The velocity of rotation is found by obtaining spark marks, due to the primary circuits of two induction coils being successively broken by a weight falling and knocking over two light levers. The distance between the levers is about 3·77 inch, and the time of fall between the levers is 0·018948 sec. In practice two drop weights are used, to avoid the chance of an experiment being wasted. This chronograph has been used for finding the velocity of projectiles after leaving the gun, and also for finding the rate at which a shot traverses the bore. For the latter purpose the shot successively cuts insulated wires fixed in plugs screwed into the gun at known intervals; each wire forms a part of the primary of an induction coil, and as each is cut a dot is made on the rotating drum by the induced spark.

Jervis-Smith's [illegible] periods of time varying fr[illegible] part of a second (*Proc. Roy. Soc.* vol. xlv. p. [illegible] from Pat. 1894. *The Tram Chronograph*, by [illegible], F R.S.). It consists of a metal girder having a T-shaped end. This carries two parallel steel rails, the edges of which lie in the same vertical plane. The girder is supported at its end, and at the extremities of the T-piece, on the V-groove, trihedral hole, and plane system. A carriage or tram furnished with three grooved wheels runs on the rails, and a slightly-smoked glass plate is attached to its vertical side. The tram in the original instrument was propelled by a falling weight, but in an improved form one or more spiral springs are employed. All time traces are made immediately after the propelling force has ceased to act. The tram is brought to rest by a gradually applied brake, consisting of two crossed leather bands stretched by two springs; a projection from the tram runs between the bands, and [illegible] with but little lateral pressure. When, for certain physiological experiments, a low velocity of traverse is required, a heavy flywheel is mounted on the tram and geared to its wheels. A pillar also mounted on the hole, groove and plane method, is placed vertically in front of the glass, to carry the electromagnetic signals, which can be brought into contact with the glass by means of a tangent-screw. A standard fork by Koenig fixed to a pillar also makes a trace on the glass, being automatically thrown into vibration. Tuning-forks may be calibrated by obtaining two signal markings on the plate, controlled by a standard clock of known rate. Two motions of a slide on the pillar, viz., of rotation and translation, allow a number of observations to be made. The traces are counted out on a sloping glass desk, and the time of flight of a projectile between two or more screens is found. When very close readings are required, they are made by means of a traversing micrometer microscope. If the instrument is used for gun work, the tram is driven at full speed; when the distance between the screens is known, and also the time of flight, the midpoint velocity is found by applying Bashforth's formula. When the velocity of shot from a shot-gun has to be found, a thin wire stretched across the muzzle takes the place of the first screen, and a thin sheet of metal or cardboard carrying an electric contact, or a Branly coherer, takes the place of the second screen. The electric firing circuit is provided with a safety key attached by a cord to the man who loads the gun and prepares the electric fuse, thus preventing him from getting into the line of fire when the gun is fired by the chronograph. (*Pat. Record*, 1897.) The tram, when the instrument is adjusted, has a practically constant velocity of traverse.

The polarizing photo-chronograph, designed and used by Dr A. Cushing Crehore and Dr G. Owen Squier at the United States Artillery School (*Journal United States Artillery*, 1895, vol. vi. p. 271), depends for its indications upon the rotation of a beam of light by a magnetic field, produced by a solenoidal current, which is opened and closed by the passage of the projectile. The general arrangement is as follows:—A beam of light from an electric lamp traverses a lens, then a Nicol prism, next a glass cylinder furnished with plane glass ends and coiled with insulated wire, then an analyser and two lenses, finally impinging on a photographic plate to which rotation is given by an electric motor, the plane of rotation being perpendicular to the direction of the beam of light. The same plate also records the shadow of a pierced projection attached to a tuning-fork, light from the electric lamp being diverted by a mirror for this purpose. The solenoid used to produce a magnetic field across the glass cylinder, which is filled with carbon bisulphide, is in circuit with a dynamo, resistances, and

the screens on the gun range. It is a well-known phenomenon in physics that when, with the above-mentioned combination of polarizing Nicol prism and analyser, the light is shut off by [illegible] analyser, it is instantly restored when the carbon bisulphide is placed in a magnetic field. This phenomenon is utilized in this instrument. The projectile, by cutting the wire screens, causes the magnetic field to cease and light to pass. By means of an automatic switch the projectile, after cutting a screen, restores the electric circuit, so that successive records are registered. After a record has been made it is read by means of a micrometer microscope, the angle moved through by the photographic disc is found, and hence the time period between two events. In the photo-chronograph described in *Untersuchungen uber die Vibration des Gewehrlaufs*, by C. Cranz and K. R. Koch, Munchen, 1899, also note on the same, *Nature*, vol. lxi. p. 58, a sensitive plate moving in a straight line receives the record of the movement of the barrels of firearms when discharged. It was mainly used to determine the "angle of error of departure" in ballistics.

*Astronomical Chronographs.*—The astronomical chronograph is an instrument whereby an observer is enabled to register the time of transit of a star on a sheet of paper attached to a revolving cylinder. A metal cylinder covered with a sheet of paper is rotated by clockwork controlled by a conical pendulum, or by a centrifugal clock governor such as is used for driving a telescope. By means of a screw longer than the cylinder, mounted parallel with the axis of the cylinder and rotated by the clockwork, a carriage is made to traverse close to the paper. In some instruments this carriage is furnished with a metal point, and in others with a stylographic ink pen. The point or pen is made to touch the paper by an electromagnet the electric current of which is closed by the observer at the transit instrument, and a mark is recorded on the revolving cylinder. The movement of the same point or pen is also controlled by a standard clock, so that at the end of each second a mark is made. The cylinder makes one revolution per minute, and the minute is indicated by the omission of the mark. In Dent's form (*Nature*, vol. xxiii. p. 59) continuous observations can be recorded for $6\frac{3}{8}$ hours. The conical pendulum used to govern the rotation of the cylinder was the invention of Sir G. B. Airy. The lower end is geared to a metal plate which sweeps through an annular trough filled with glycerine and water. When the path of the pendulum exceeds a certain diameter it causes the plate to enter the liquid more deeply, its motion being thereby checked; also, when the pendulum moves in a smaller circle, the plate is lifted out of the liquid and the resistance is diminished in the same proportion as the force. The compensatory action is considerable; doubling the driving power produces no perceptible difference in the time. To prevent the injury of the conical pendulum and the wheel work by any sudden check of the cylinder, a ratch-wheel connexion is placed between the cylinder and the train of wheel work; this enables the pendulum to run on until it gradually comes to rest. The pendulum, which weighs about 18 lb, is compensated, and makes one revolution in two seconds; it is suspended from a bracket by means of two flexible steel springs placed at right angles to one another.

In the astronomical chronograph designed by Sir Howard Grubb, F.R.S. (*Proc. Inst. Mech. Eng.*, July 1888), the recording cylinders —two in number—are driven by a weight acting on a train of wheel work controlled by an astronomical telescope governor. The peculiar feature of this instrument is that the axle is geared to a shaft which communicates motion to the cylinders through a mechanism whereby the speed of rotation is constantly corrected by a standard clock. Should the rotation fall below the correct speed, it is automatically accelerated, and if its speed of rotation rises above the correct one, it is retarded. The accelerator and retarder are thrown into action by electromagnets, controlled by a "detector" mounted on the same shaft. The rather complicated mechanism employed to effect the correction is described and fully illustrated in the reference given. The cylinders are covered with paper, but all the markings are made with a stylographic pen. The marks indicating seconds are dots, but those made by the observer are short lines. When an observation is about to be made, the observer first notes the hour and minute, and, by pressing a contact key attached to a flexible cord at the transit instrument, marks the paper with a letter in Morse telegraph characters, indicating the hour and minute; he then waits till a micrometer wire cuts a star and at the instant closes the circuit, so that the second and fraction of a second are registered on the chronograph paper. When a set of observations have been taken, the paper is removed from the cylinder, and the time results are obtained by applying a suitably divided rule to the marked paper, fractions of a second being estimated by applying a piece of glass ruled with eleven straight lines converging to a point. The ends of these lines on the base of the triangle so formed are equidistant on one edge of the glass, so that when the first and last lines are so placed as to coincide with the beginning and end of the markings of a second, that second is divided into ten equal parts. The base of the triangle is always kept parallel with the line of dots. The papers, after they have been examined and the results registered, are kept for reference.

The observatory of Washburn, University of Wisconsin, is furnished with a chronograph of the same type as that of Dent (*Annals Harvard Coll. Obs.* vol. i. pt. ii. p. 34), but in this instrument the rotation of the cylinder is controlled by a double conical pendulum governor of peculiar construction. When the balls fly out beyond a certain point, one of them engages with a hook attached to a brass cylinder which embraces the vertical axle loosely. When this mass is pulled aside the work done on it diminishes the speed of the governor. The pendulum ball usually strikes the hook from 60 to 70 times per minute. Governors on this principle were adopted by Alvan Clark for driving heliostats in the United States Transit of Venus Expedition, 1874.

*Acoustic Chronographs.*—A chronograph was devised by Regnault (*Acad. des Sc.*, 1868) to determine the velocity of sound propagated through a great length of pipe. A band of paper 27 mm. wide was continuously unrolled from a bobbin by means of an electromagnetic engine In its passage over a pulley it passed over a smoky lamp flame, which covered it with a thin deposit of carbon. It next passed over a cylinder in contact with the style of a tuning-fork kept in vibration by electromagnets placed on either side of its prongs, the current being interrupted by the fork; it was also in contact with an electric signal controlled by a standard clock. Also an electromagnetic signal marked the beginning and end of a time period. Thus three markings were registered on the band, viz., the time of the pendulum, the vibrations of the fork, and the marking of the signal due to the opening and closing of the current by electrical contacts attached to diaphragms on which the sound wave acted. The contacts consisted of minute hammers resting on metal points fixed to the centre of diaphragms which closed the end of the experimental pipes. The signal marked the instant at which a sound wave impinged on a diaphragm. The markings on the paper band gave the period of time between two events, and the number of vibrations of the tuning-fork per second were estimated by means of markings due to the clock. The sound wave was usually originated by firing a pistol into the pipe furnished with diaphragms and contact pieces.

In the chronographic use of the Morse telegraph instrument (Stewart and Gee, *Elementary Practical Phys.* p. 234) a circuit is arranged which includes a seconds pendulum furnished with a fine platinum wire below the bob, which sweeps through a small mass of mercury forming a part of the circuit. There is a Morse key for closing the circuit. A fast-running Morse instrument and a battery are placed across this circuit as a shunt. A succession of dots is made on the paper ribbon by the circuit being closed by the pendulum, and the space between each adjacent dot indicates a period of one second's duration. Also, when the key is depressed, a mark is made on the paper. To measure a period of time, the key is depressed at the beginning and end of the period, causing two dots to be made on the ribbon; the interval between these, when measured by the intervals due to the pendulum, gives the length of the period in seconds, and also in fractions of a second, when the seconds' interval is subdivided into convenient equal parts. This apparatus has been used in determination of the velocity of sound. In the break circuit arrangement of pendulum key and Morse instrument the markings appear as breaks in a line which would otherwise be continuous. This combination was employed by Professors Ayrton and Perry in their determination of the acceleration of gravity at Tokio, 1877-78 (*Proc. Phys. Soc.* London, vol. iii. p. 268).

In the tuning-fork electro-chronograph attributed to Hipp a metal cylinder covered with smoked glazed paper is rotated uniformly by clockwork, a tuning-fork armed with a metallic style being so adjusted that it makes a clear fine line on the smoked paper. The tuning-fork is placed in the secondary circuit of an induction coil, so that when the primary circuit is broken an induced spark removes a speck of black from the paper and leaves a mark. The time period is deduced by counting the number of vibrations and fractions of vibration of the tuning-fork as recorded by a sinuous line on the cylinder. In later forms of this instrument the cylinder advances as it rotates, and a spiral line is traced. To obtain good results the spark must be very small, for when large it often leaps laterally from the end of the style, and does not give the true position of the style when the circuit is broken. The same arrangement of tuning-fork and revolving cylinder, with the addition of a standard clock, has been used by Mayer (*Trans. National Academy of Sciences U.S.A.* vol. iii.) and others for calibrating tuning-forks, and comparing their vibrations directly with the beats of the pendulum of a standard clock the rate of which is known. The pendulum makes and breaks the primary circuit by carrying a small platinum wire through a small mercury meniscus. Better and apparently certain contacts can be obtained from platinum contact-pieces,

brought together above the pendulum by means of a toothed wheel on the scape-wheel arbor. Sparking at the contact points is greatly reduced by placing a couple of lead plates in dilute sulphuric acid as a shunt across the battery circuit.

*For physiological purposes.*—Fick's pendulum myograph or muscle-trace recorder is described in *Vierteljahrschr. der Naturforsch. Ges. in Zurich*, 1862, s. 307, and in *Text-book of Physiology*, M. Foster, pp. 42, 45. It was used to obtain a record of the contraction of a muscle when stimulated. In many respects the instrument is similar to the electro-ballistic chronograph of Navez. A long pendulum, consisting of a braced metal frame, carries at its lower end a sheet of smoked glass. The pendulum swings about an axis supported by a wall bracket. Previous to an experiment, the pendulum is held on one side of its lowest position by a spring catch; when this is depressed it is free to swing. At the end of its swing it engages with another spring catch. In front of the moving glass plate a tuning-fork is fixed, also a lever actuated by the muscle to be electrically stimulated. When the pendulum swings through its arc, it knocks over the contact key in the primary circuit of an induction coil, the secondary of which is in connexion with the muscle. The smoked plate receives the traces of the style of the tuning-fork and of the lever attached to the muscle, and also the trace of an electromagnetic signal which marks the instant at which the primary circuit is broken. After the traces are made, they are ruled through with radial lines, cutting the three traces, and the time intervals between different parts of the muscle curve are measured in terms of the period of vibration of the tuning-fork, as in other chronographs in which the tuning-fork is employed.

In the spring myograph of Du Bois Reymond (Munk's *Physiologie der Menschen*, p. 398) a smoked glass plate attached to a metal rod is shot by a spiral spring along two guides with a velocity which is not uniform. The traces of a style moved by the muscle under examination, and of a tuning-fork, are recorded on the glass plate, the shooter during its traverse knocking over one or more electric keys, which break the primary circuit of an induction coil, the induced current stimulating the muscle.

In the photo-electric chronograph devised by Mr G. J. Burch (*Journal of Physiology*, vol. xviii. p. 125; *Electrician*, vol. xxxvii. p. 436) the rapid movements of the column of mercury in a capillary electrometer used in physiological research are recorded on a sensitive plate moving at a uniform angular velocity. The trace of the vibrating prongs of a tuning-fork of known period is also recorded on the plate, the light used being that of the electric arc. The images of the meniscus of the mercury column and of the moving fork are focussed on the plate by a lens. Excellent results have been obtained with this instrument.

An important development of a branch of chronography is due to Marey (*Comptes Rendus*, 7 Août 1882, and *Le Mouvement*, par E. S. Marey, Paris, 1894), who employed a photographic plate for receiving successive pictures of moving objects, at definite times, when investigating the movements of animals, birds, fishes, insects, and also microscopic objects such as vorticellæ. The instrument in one of its forms consisted of a camera and lens. In front of the sensitive plate and close to it a disc, pierced with radial slits, revolved at a given angular velocity, and each time a slit passed by the plate was exposed. But since, in the time of passage of the space between the slits, the object had moved by a certain amount across the field of view, a fresh impression was produced at each exposure. The object, well illuminated by sunlight, moved in front of a black background. Since the angular velocity of the disc was known, and the number of slits, the time between the successive positions of the object was also known.

Marey (*La Méthode graphique*, pp. 133, 142, 456), by means of pneumatic signals and a rotating cylinder covered with smoked glazed paper, measured the time of the movements of the limbs of animals. The instrument consists of a recording cylinder rotated at a uniform angular velocity by clockwork controlled by a fan governor, and pneumatic signal, constructed thus. One end of a closed shallow cylinder, about 4 cm. dia., is furnished with a stretched rubber membrane. A light lever, moving about an axis near the edge of the cylinder, is attached to the centre of the membrane by a short rod, its free end moving as the membrane is distended. The cylinder is connected by a flexible tube with a similar cylinder and membrane, but without a lever, which is attached to that part of the body of the animal the movement of which is under investigation. The system is full of air, so that when the membrane attached to the animal is compressed, the membrane which moves the lever is distended and the lever moved. Its end, which carries a scribing point, marks the smoked paper on the rotating cylinder. The pneumatic signal is called by Marey "tambour à levier."

**Chronological Table.**—The following table of the leading events in every country in the world has been prepared in continuation of the table published in the ninth edition of this work, which brought down the record to the close of 1875. It must always be difficult to determine what events should or should not appear in such a chronicle, but in this brief abstract the aim has been to include rather than to exclude, with a view to making the table a really useful *aide-mémoire*:—

1876. Chapter of Knights of the Star of India held by the Prince of Wales in Calcutta, January 1. Death of Francis Deák, January 28. Administrative reform Note presented to Turkey by the Great Powers, January 31. Perak River insurgents defeated by the British, February 4. Prince Bismarck's reply to the charge of warlike designs, February 10. Purchase of Suez Canal shares voted by the House of Commons, February 21. Don Carlos retires from Spain, February 27. Incorporation of Khokand in the Russian Empire, March 13. Royal Titles Bill passed by the House of Commons, March 23. Philadelphia Centennial Exhibition opened, May 10. British fleet arrives in Besika Bay, May 26. Turkish massacres in Bulgaria, May. Deposition of Sultan Abdul Aziz, May 30. First railway opened in China, June 3. Death of Lord Sandhurst, June 23 (born, 1819). Slaughter of United States troops by Sioux Indians, June 25. Death of Miss Harriet Martineau, June 27 (born, 1802). Servia and Montenegro declare war against Turkey, July 2. Mr Disraeli created Earl of Beaconsfield, August 16. Deposition of Sultan Murad V., August 31. Sir T. Death of Lord Selborne, May 4 (born, 1812). French expedition under General Duchesne arrives at Madagascar, May 6. Kiel Canal opened, June 21. Resignation of the Rosebery Ministry, June 22. Lord Salisbury appointed Prime Minister, June 25. Death of T. H. Huxley, June 29 (born, 1825). Parliament dissolved, July 12. Murderous assault on M. Stambuloff, July 15; he died July 19 (born, 1852). Death of Professor von Gneist, July 21 (born, 1816). Anglo-Russian Pamirs Commission completes its work, September 18. Death of M. Pasteur, September 28 (born, 1822). Antananarivo captured by the French, September 30. Lord Wolseley became Commander-in-Chief, November 1. Clyde shipping strike, November 6. Sir F. Scott, commanding Ashanti expedition against King Prempeh, leaves England, November 22. Death of Barthélemy St Hilaire, November 25 (born, 1805). Death of A. Dumas, *fils*, November 27 (born, 1824). Jabez Balfour sentenced for Liberator frauds, November 28 Defeat of Italians in Abyssinia, December 7. President Cleveland's Venezuela message to Congress, December 17. Dr Jameson with Chartered Company's troops invades the Transvaal, December 29.

1896. Mr Alfred Austin made Poet Laureate, January 1. Dr. Jameson's force defeated by the Boers near Krugersdorp, January 1. Surrender of Dr Jameson, January 2. Kaiser's telegram to Kruger published, January 3. Resignation of Mr Rhodes as Premier of Cape Colony, January 6. Dr Jameson and officers surrendered by Boers to British authorities, January 7. British flying squadron commissioned, January 7. Death of Paul Verlaine, January 8 (aged 51). Arrest of Johannesburg reformers, January 9, 10. Anglo-French difficulty regarding Siam settled, January 15. Kumassi occupied by British, January 18. Death of Prince Henry of Battenberg, January 20 (born 1858). Clyde shipping strike settled, January 21. Death of Lord Leighton, January 24 (born, 1830). General Weyler leaves Spain to command against rebels in Cuba, January 25. Sir J. E. Millais elected President of the Royal Academy, February 20. Mr Steyn made President of the Orange Free State, February 21. Italians defeated by Abyssinians at Adowa, March 1. General Kitchener leaves Cairo to command Dongola expedition, March 22. Rising of the Matabele, March 25. Li Hung-chang left China to visit Europe, March 28. Johannesburg reformers sentenced, April 28; death sentences commuted same day. Major Lothaire acquitted in connexion with the hanging of Mr Stokes, April 28. Shah of Persia assassinated, May 1. Dervishes defeated near Akasheh, Sudan, May 1. Hungarian millenary exhibition, May 2. Matabele defeated at Gwelo, May 9. Tsar's coronation, May 26. Dervishes defeated at Ferkeh, June 7. Death of Jules Simon, June 8 (born, 1814). Dr Jameson and officers committed for trial, June 15. Japanese towns destroyed by sea wave, June 15. Madagascar declared a French colony, June 20. Death of Mrs Beecher Stowe, July 1 (born, 1812). Dr Jameson and officers convicted under Foreign Enlistment Act, July 28. Li Hung-chang arrived in England, August 2. Defeat of the Matabele, August 5. Death of Sir J. E. Millais, August 13 (born, 1829). Conference by Mr Rhodes with Matabele chiefs, August 20; followed by submission of natives. Zanzibar bombarded by British, August 27. Massacre of Armenians in Constantinople, August 25–27. Death of Prince Lobanof, August 30 (born, 1824). Return of Dr Nansen to Christiania, September 9. Dongola occupied by Egyptian troops, September 23. Death of William Morris, October 3 (born, 1834). Tsar's arrival in Paris, October 6. Death of Archbishop Benson, October 11 (born, 1829). Bishop Temple made Archbishop of Canterbury, October 26. Treaty of peace between Italy and Abyssinia, October 26. Mr M'Kinley elected President of the United States, November 3. Anglo-American agreement about Venezuela announced, November 9. Russo-Chinese treaty *re* Manchurian railway published, December 8.

1897. Unarmed British party attacked and massacred near Benin, January 2. Niger Company's expedition against Nupé and Ilorin starts, January 6. Olney-Pauncefote arbitration treaty signed, January 11. Death of Sir I. Pitman, January 22 (aged 84). Submission of Nupé, February 5. Greek force under Colonel Vassos landed in Crete, February 14. South Africa Committee's sittings begun, February 16. Submission of Ilorin, February 18. Benin city captured by British, February 18. International force sent to Crete by the Powers, March 18. Death of Johannes Brahms, April 3 (aged 63). War declared by Turkey against Greece, April 17. Maluna Pass captured by the Turks, April 18. Canadian Differential Tariff Bill introduced, April 23. Greek retreat from Larissa, April 25. Disastrous fire at a charity bazaar in Paris, causing great loss of life, including the Duchesse d'Alençon, May 4. Olney-Pauncefote arbitration treaty rejected by United States Senate, May 5. Greek retreat from Phersala, May 6. Death of the Duc d'Aumale, May 7 (born, 1822). Arrival of Sir A. Milner in South Africa as High Commissioner, May 7. Intervention of the Powers between Turkey and Greece, May 11. Disaster to a British force in the Tochi Valley, Indian frontier, June 10. Severe earthquakes in Assam and other parts of India, June 12. Queen Victoria's Diamond Jubilee, June 22. British plague officials murdered near Bombay, June 22. Death of Mrs Oliphant, June 25 (born, 1828). Naval review at Spithead, June 26. Death of Henri Meilhac, July 7 (aged 66). Herr Andrée's balloon expedition started for the North Pole, July 10. South Africa Committee's report issued, July 13 Death of Jean Ingelow, July 20 (aged 71). Excitement over Klondike gold discoveries, July 23. Rising in the Swat Valley, July 26. Capture of Abu Hamed, Sudan, August 7. Assassination of Señor Canovas del Castillo, Spanish Premier, August 8. General cessation of Swat Valley hostilities, August 21. Rising of Afridis, August 23. Arrival of President Faure at Kronstadt to visit the Tsar, August 23. Farewell luncheon on board the *Pothuau* at Kronstadt, August 26. Berber occupied by Egyptian troops, September 13. Severe fighting with the Mamunds, September 17. Preliminary treaty of peace between Turkey and Greece signed, September 18. General Weyler recalled from Cuba, October 8. Advance against Afridis begun by Sir W. Lockhart, October 19. Dargai heights stormed, October 20. Herr von Bulow appointed German Foreign Minister, October 22. Death of the Duchess of Teck, October 27 (born, 1833) Dreyfus *bordereau* published by the *Matin*, November 10. Kiao-chow Bay occupied by Germans, November 14. Great fire in Cripplegate, November 19. Final treaty of peace between Turkey and Greece signed, December 4. Departure of Prince Henry of Prussia for China, December 16. Death of Alphonse Daudet, December 16 (born, 1840). British retirement from Tirah highlands to winter quarters, about December 20. Famine and plague very severe in India during the year.

1898. Major Esterhazy acquitted of treason by court-martial, January 11. M. Zola's letter, "J'accuse," published in the *Aurore*, January 13. Death of "Lewis Carroll," January 14 (aged 65). Death of Mr C. P. Villiers, January 16 (born, 1802). Uganda rebels defeated, January 29. The United States warship *Maine* blown up in Havana harbour, February 15. M. Zola convicted for libel, February 23. Death of Sir Henry Bessemer, March 15 (born, 1813). Port Arthur and Ta-lien-wan ceded to Russia, March 23. Great coal strike in South Wales, April 1. Submission of Khaibar tribesmen, April 1; the frontier pacified. Wei-hai-wei ceded to Great Britain, April 2. Dervishes defeated on the Athara, April 8. War between the United States and Spain, April 21. Spanish fleet at Manila destroyed by Commodore Dewey, May 1. Serious riots in Milan, May 7. Death of W. E. Gladstone, May 19 (born, 1809). Spanish fleet under Admiral Cervera arrived at Santiago de Cuba, May 19. The *Merrimac* sunk by Lieutenant Hobson at the entrance to Santiago harbour, June 3. Bankruptcy of Mr E. T. Hooley, June 8. Agreement with France *re* West Africa signed, June 14. Resignation of M. Méline, French Premier, June 15, succeeded by M. Brisson. Death of Sir E. Burne-Jones, June 17 (born, 1833). Cervera's squadron destroyed by Admiral Sampson near Santiago, July 3. Major Marchand reached Fashoda, July 10. Santiago occupied by Americans, July 17. Death of Prince Bismarck, July 30 (born, 1815). Canadian preferential tariff in favour of Great Britain came into operation, August 1. Sudanese troops decisively defeated in Uganda by Major Martyr, August 4; they had been in mutiny since October 1897. Spanish-American peace preliminaries settled, August 12. Manila surrendered to Americans, August 13. United States and Canadian Conference at Quebec opened, August 23. Tsar's disarmament proposal issued, August 21. Suicide of Colonel Henry while under arrest for forging evidence in the Dreyfus case, August 30. Complete defeat of the Khalifa at Omdurman, September 2. Assassination of the Empress of Austria at Geneva, September 10. Terrible hurricane in the West Indies, September 11. Death of Sir George Grey, September 19 (born, 1812). Meeting between the Sirdar and Major Marchand at Fashoda, September 21. *Coup d'État* in China, Dowager-Empress becoming regent, September 22. Dreyfus case remitted to the Court of Cassation, September 26. Death of Puvis de Chavannes, October 25 (aged 72). Resignation of M. Brisson, October 25; succeeded by M. Ch. Dupuy. Arrival of the Kaiser at Haifa on his tour in the Holy Land, October 27. French Government decided to evacuate Fashoda, November 4. Prince George of Greece nominated High Commissioner of Crete, November 26. Spanish-American treaty of peace signed, December 10. Death of William Black, December 10 (born, 1841). Withdrawal of Major Marchand from Fashoda, December 11. Retirement from the Liberal leadership by Sir W. Harcourt announced, December 13. Imperial penny postage came into force, December 25. Plague was again prevalent in India this year, especially in Bombay.

1899. Native disturbances in Samoa, January 1. Anglo-Egyptian agreement regarding the Sudan, January 19. Fighting at

Manila between United States troops and Filipinos, February 4. Death of Count von Caprivi, February 6 (born, 1831). Death of President Faure, February 15 (born, 1841). Émile Loubet elected French President, February 18. Russian manifesto issued limiting Finnish autonomy, February 20. Death of Lord Herschell, March 1 (born, 1837). Agreements regarding railways and telegraphs in Africa negotiated with the German Government by Mr Rhodes in Berlin, March 10–16. Apia shelled by British and American warships, March 16. Anglo-French convention signed regarding possessions in Africa, March 21. Death of Édouard Pailleron, April 20 (born, 1834). British and Italian squadrons reviewed in Aranci Bay by King Humbert, April 22. The Hague Peace Conference opened, May 18. Death of Señor Castelar, May 25 (born, 1832). Death of Rosa Bonheur, May 25 (born, 1823). Conference opened at Bloemfontein between Sir A. Milner and President Kruger, May 31. Sale announced of Spanish Pacific islands to Germany, June 2. Death of Johann Strauss, June 3 (born, 1826). Dreyfus verdict annulled by Court of Cassation and new court-martial ordered, June 3. Bloemfontein Conference concluded without result, June 6. Provisional Government for Samoa appointed, June 9. Defeat of French Ministry, June 12. Venezuela arbitration proceedings begun in Paris, June 15. French Ministry formed by M. Waldeck-Rousseau, June 22. Dreyfus landed in France for retrial at Rennes, July 1. Death of Victor Cherbuliez, July 1 (born, 1829). London Government Bill passed the Lords, July 4. Lieutenant-Colonel Klobb, of the French marines, killed in the Sudan by Captain Voulet's troops, July 14. Close of The Hague Conference, July 29. Retrial of Dreyfus begun, August 7. M. Labori, counsel for Dreyfus, shot in the back, August 14. Death of Professor Bunsen, August 16 (born, 1811). Dreyfus found guilty by the Rennes court-martial, September 9; pardoned, September 19. Last British despatch in Transvaal negotiations succeeding the Bloemfontein Conference, September 22. Decision of the Venezuela Arbitration Court, October 3. Boer ultimatum, October 9; war begun, October 11. Battle of Talana Hill, October 20; Sir W. P. Symons mortally wounded. Battle of Elandslaagte, October 21. British disaster at Nicholson's Nek, October 30. Arrival of Sir R. Buller at the Cape, October 31. Anglo-German Samoa Convention signed, November 14. Successful advance by Lord Methuen, driving the Boers from Belmont, November 23; Graspan, November 25; and Modder River, November 28; but with severe British losses. Defeat and death of the Khalifa at Om Debrika, November 25. Serious reverse to General Gatacre at Stormberg, December 10. Lord Methuen repulsed at Magersfontein, December 11; General Wauchope killed. Sir R. Buller repulsed at Colenso, December 15; eleven guns lost. Lord Roberts appointed to chief command in South Africa, with Lord Kitchener Chief of the Staff, December 16. New South Wales, Victoria, South Australia, Queensland, and Tasmania this year agreed on a scheme of federation. Famine and distress in Russia.

1900. Enrolment of members of the C.I.V. corps, January 1. Boer assault on Ladysmith repulsed, January 6. Arrival of Lord Roberts and staff at Cape Town, January 10. Osman Digna captured near Tokar, January 19. Death of John Ruskin, January 20 (born, 1819). Death of R. D. Blackmore, January 20 (born, 1825). Fresh advance by General Buller repulsed after heavy fighting at Spion Kop, January 24. Lord Roberts's advance from Modder River begun, February 11. Relief of Kimberley by General French, February 15. Indian Famine Mansion House Fund opened, February 15. Severe fighting in Natal by General Buller's force, February 18–23. Surrender of Cronje and 4000 Boers at Paardeberg, February 27. Relief of Ladysmith, February 28. Théâtre Français destroyed by fire, March 8. Bloemfontein occupied, March 13. Death of General Sir W. Lockhart, March 18 (born, 1841). Death of Commandant General Joubert, March 27. Delagoa Bay award issued after eleven years, March 29. British force caught in ambush at Sanna's Post, March 31. Surrender of 600 British at Reddersburg, April 3. Queen's visit to Dublin, April 4. Attempt on the Prince of Wales by Sipido at Brussels, April 4. Death of Ghazi Osman Pasha, April 4 (aged 68). News received of a rising in Ashanti, April 9. Paris Exhibition opened, April 14. Death of the Duke of Argyll, April 24 (born, 1823). Death of M. de Munkacsy, May 1 (born, 1844). Advance from Bloemfontein begun, May 2. Relief of Mafeking, May 17. Anxiety in Peking over the Boxer outbreak, May 20. Orange Free State annexed, May 26. Johannesburg occupied, May 31. Pretoria occupied, June 5. Start of Admiral Seymour's expedition to relieve Peking Legations, June 10; forced to retreat, June 19; returned to Tientsin, June 26. Resignation of Mr Schreiner's Cape Ministry, June 13; succeeded by Sir J. Gordon Sprigg. Massacre of native Christians in Peking, June 13. Taku forts captured by the allied squadrons, June 17. Baron von Ketteler, German Minister, murdered in Peking, June 20; siege of the Legations begun. Death of Count Muravieff, Russian Chancellor, June 21 (born, 1845); succeeded by Count Lamsdorff. Australian Commonwealth Bill received the royal assent, July 9. Earl of Hopetoun appointed Governor-General of Australian Commonwealth, July 13. Russians attacked by Chinese in Eastern Siberia, July 14; resulting operations ended in occupation of Manchuria by Russian troops. Native city of Tientsin captured by the allies, July 14. Kumassi garrison relieved by Colonel Willcocks, July 15. Assassination of King Humbert of Italy, July 29 (born, 1844). Death of the Duke of Coburg, July 30 (born, 1844). Surrender of General Prinsloo and 3000 Boers, July 30–31. West Australia decided to join the Commonwealth, August 2. Death of Lord Russell of Killowen, August 10 (born, 1832). Relief of the Peking Legations, August 14. Mansion House War Fund exceeded £1,000,000, September 3. Komati Poort occupied by the British, September 24. Parliament dissolved, September 25; the Unionists again returned, with a majority of 134. Lord Roberts appointed Commander-in-Chief, September 30. Anglo-German agreement regarding China, October 16. Resignation of Prince Hohenlohe, German Chancellor, October 17; succeeded by Count von Bulow. Mr Kruger sailed for Europe, October 20. Transvaal annexed by Royal proclamation, October 25. Death of Mr Sims Reeves, October 25 (born, 1822). Death of Professor Max Muller, October 28 (born, 1823). Defeat of De Wet near Bothaville, November 5. Re-election of President M'Kinley, November 6. Death of Sir Arthur Sullivan, November 22 (born, 1842). Arrival of Mr Kruger at Marseilles, November 22. Dewetsdorp captured by De Wet, November 23. Command in South Africa handed over to Lord Kitchener, November 29. Mr Kruger left Paris for Germany, December 1; refused an interview by the German Emperor; proceeded to Holland. Attempted invasion of Cape Colony by De Wet foiled, December 2–8. Mr Healy expelled by the Irish Nationalist party, December 11. Reverse to General Clements's force at Nooitgedacht, December 13. Invasion of Cape Colony by Boers under Kritzinger and Hertzog, December 16. Hay-Pauncefote Treaty ratified by the United States Senate with amendments, December 20. Death of Field-Marshal Count von Blumenthal, December 22 (born, 1810). Death of Lord Armstrong, December 27 (born, 1810). Mr Barton appointed first Premier of the Australian Commonwealth, December 30. Allies' terms to China accepted in principle, December 30. Proposed Russo-Chinese agreement *re* Manchuria known in Peking, December 31. Terribly severe famine in India this year.

(W. W. S.*)

# CHRONOLOGY, BIBLICAL.

## 1. Old Testament.

A SENSE of the importance of a fixed standard of chronology was only acquired gradually in the history of the world. Nations in a primitive state of civilization were not, and are not, conscious of the need. When the need began to be felt events were probably at first dated by the regnal years of kings; the reigns of successive kings were then arranged in order, and grouped, if necessary, in dynasties, and thus a fixed standard was gradually constructed. Particular states also not unfrequently introduced fixed eras, which obtained a more or less extensive currency, as the era of the first Olympiad (776 B.C.), of the foundation of Rome (753 B.C.), and of the Seleucidæ at Antioch (312 B.C.), which is followed by the Jewish author of the first book of Maccabees. Some of the earliest documents which we possess are dated by the year in which some noticeable event took place, as in contract-tablets of the age of Sargon of Agadè (3800 B.C., or, according to other authorities, 2800 B.C.), "In the year in which Sargon conquered the land of Amurru [the Amorites]"; or, "In the year in which Samsu-satana [*c.* 2200 B.C.] made the statue of Marduk": Is. vi. 1 ("In the year of King Uzziah's death"), xiv. 28, xx. 1, are examples of this method of dating found even in the Old Testament. In process of time, however, the custom of dating by the regnal year of the king became general. The Babylonians and Assyrians were probably the first to construct and

employ a fixed chronological standard; and the numerous contract-tablets, and lists of kings and yearly officials, discovered within recent years, afford striking evidence of the precision with which they noted chronological details. Biblical chronology is, unfortunately, in many respects uncertain. Prior to the establishment of the monarchy the conditions for securing an exact and consecutive chronology did not exist; the dates in the earlier period of the history, though apparently in many cases precise, being in fact added long after the events described, and often (as will appear below) resting upon an artificial basis, so that the precision is in reality illusory. And after the establishment of the monarchy, though the conditions for an accurate chronology now existed, errors by some means or other found their way into the figures; so that the dates, as we now have them, are in many cases at fault by as much as two to three decades of years. The *exact* dates of events in Hebrew history can be determined only when the figures given in the Old Testament can be checked and, if necessary, corrected by the contemporary monuments of Assyria and Babylonia, or (as in the post-Exilic period) by the knowledge which we independently possess of the chronology of the Persian kings. In the following parts of this article the chronological character of each successive period of the Old Testament history will be considered and explained as far as the limits of space at the writer's disposal permit.

I. *From the Creation of Man to the Exodus.*—In the whole of this period the chronology, in so far as it consists of definite figures, depends upon that part of the Pentateuchal narrative which is called by critics the "Priestly Code" (see PENTATEUCH in *Ency. Brit.*, ninth edition, vol. xviii.). The figures are in most, if not in all cases artificial, though the means now fail us of determining upon what principles they were calculated. It is also to be noted that in the Samaritan text of the Pentateuch, and in the LXX., the figures, especially in the period from the Creation to the birth of Abraham, differ considerably from those given in the Hebrew, yielding in Sam. a lower, but in the LXX. a much higher total. The following tables will make the details clear:—

(1) *From the Creation of Man to the Flood* (Gen. v., and vii. 11).

| | Age of each at birth of next. | | |
|---|---|---|---|
| | Heb. | Sam. | LXX. |
| Adam (930) | 130 | 130 | 230 |
| Seth (912) | 105 | 105 | 205 |
| Enosh (905) | 90 | 90 | 190 |
| Kenan (910) | 70 | 70 | 170 |
| Mahalalel (895) | 65 | 65 | 165 |
| Jared (962) | 162 | 62 | 162 |
| Enoch (365) | 65 | 65 | 165 |
| Methuselah (969) | 187 | 67 | 187 [1] |
| Lamech (777) | 182 | 53 | 188 |
| Noah (950); age at Flood | 600 | 600 | 600 |
| Total from the Creation of Man to the Flood | 1656 | 1307 | 2262 |

The figures in parentheses indicate the entire ages assigned to the several patriarchs; these are generally the same in the three texts. The Sam., however, it will be noticed, makes in three cases the father's age at the birth of his eldest son less than it is in the Heb. text, while the LXX. makes it in several cases as much as 100 years higher, the general result of these differences being that the total in the Sam. is 349 years less than in the Heb., while in the LXX. it is 606 years more. The names, it need hardly be remarked, belong to the prehistoric period, and equally with the figures are destitute of historical value.

(2) *From the Flood to the Call of Abraham* (Gen. xi.).

| | Age of each at birth of next. | | |
|---|---|---|---|
| | Heb. | Sam. | LXX. |
| Arphaxad (438) [2] | 35 [3] | 135 | 135 |
| Cainan (460) [cf. Luke iii. 27] | .. | ... | 130 |
| Shelah (433) | 30 | 130 | 130 |
| Eber (464) | 34 | 134 | 134 |
| Peleg (239) | 30 | 130 | 130 |
| Reu (239) | 32 | 132 | 132 |
| Serug (230) | 30 | 130 | 130 |
| Nahor (148) | 29 | 79 | 79 |
| Terah (205) | 70 | 70 | 70 |
| Abraham (175); age at Call (Gen. xii. 4) | 75 | 75 | 75 |
| Total from the Flood to the Call of Abraham | 365 | 1015 | 1145 |

The variations are analogous to those under (1), except that here the birth-years of the patriarchs in both Sam. and LXX. differ more consistently in one direction, being, viz., almost uniformly higher by 100 years. It has been much debated, in both cases, which of the three texts preserves the original figures. In (2) it is generally agreed that the Heb. does this, the figures in Sam. and LXX. having been arbitrarily increased for the purpose of lengthening the entire period. The majority of scholars hold the same view in regard also to (1); but Dillmann gives here the preference to the figures of the Sam. The figures, of course, in no case possess historical value: accepting even Ussher's date of the Exodus, 1491 B.C., which (see below) is earlier than is probable, we should obtain from them for the creation of man 4157 B.C., or (LXX.) 5328,[4] and for the confusion of tongues, which, according to Gen. xi. 1-9, immediately followed the Flood, 2501 B.C., or (LXX.) 3066 B.C. But the monuments of Egypt and Babylonia make it certain that man must have appeared upon the earth long before either 4157 B.C. or 5328 B.C.; and numerous inscriptions, written in three distinct languages—Egyptian, Sumerian, and Babylonian—are preserved, dating from an age considerably earlier than either 2501 B.C. or 3066 B.C.[5] The figures of Gen. v. and xi. thus merely indicate the manner in which the author of the priestly narrative—and probably to some extent tradition before him—pictured the course of these early ages of the world's history. The ages assigned to the several patriarchs (except Enoch) in Gen. v. are much greater than those assigned to the patriarchs mentioned in Gen. xi., and similarly the ages in Gen. xi. 10-18 are higher than those in Gen. xi. 19-26; it is thus a collateral aim of the author to exemplify the supposed gradual diminution in the normal years of human life.

The Babylonians, according to Berossus, supposed that there were ten antediluvian kings, who they declared had reigned for the portentous period of 432,000 years: 432,000 years, however, it has been ingeniously pointed out by Oppert (*Gött. Gel. Nachrichten*, 1877, p. 205 *ff.*) = 86,400 *lustra*, while 1656 years (the Heb. date of the Flood) = 86,400 *weeks* ($1656 = 72 \times 23$; and 23 years being = 8395 days + 5 intercalary days = 8400 days = 1200 weeks); and hence the inference has been drawn that the two periods have in some way been developed from a common basis, the Hebrews taking as their unit a week, where the Babylonians took a *lustrum* of 5 years.

[1] Or, according to some MSS., 167.

[2] Shem, the father of Arphaxad, is aged 100 at the time of the Flood, and lives for 600 years.

[3] Disregarding the "two years" of Gen. xi. 10: see v. 32, vii. 11.

[4] Taking account of the reading of LXX. in Ex. xii. 40 (p. 75).

[5] See further the present writer's essay in Hogarth's *Authority and Archæology* (1899), pp. 32-34.

(3) *From the Call of Abraham to the Exodus.*

| | |
|---|---|
| From the Call of Abraham to the birth of Isaac (Abraham being then aged 100, Gen. xxi. 5). | 25 years |
| Age of Isaac at the birth of Esau and Jacob (Gen. xxv. 26) . . . . . . . | 60 ,, |
| Age of Jacob when he went down into Egypt (Gen. xlvii. 9) . . . . . . | 130 ,, |
| The period of the Patriarchs' sojourn in Canaan was thus . . . . . . . | 215 ,, |
| But the period of the Israelites' sojourn in Egypt, according to Ex. xii. 40, 41, was . . . . | 430 ,, |

We thus get—

| | |
|---|---|
| From the Call of Abraham to the Exodus (Heb. text) . . . . . . . 215 + 430 = | 645 years |
| From the Flood to the Call of Abraham (Heb. text) . . . . . . . . . . | 365 ,, |
| From the Creation of Man to the Flood (Heb. text) . . . . . . . . . . | 1656 ,, |
| From the Creation of Man to the Exodus (Heb. text) . . . . . . . . . . | 2666 ,, |

On these figures the following remarks may be made :—(i.) In Genesis the chronology of the Priestly Code ("P") is not consistent with the chronology of the other parts of the book ("JE"). Three or four illustrations will suffice: (*a*) The author of Gen. xii. 10-20 evidently pictures Sarai as a comparatively young woman, yet, according to P (xii. 4, xvii. 17) she was 65 years old. (*b*) In Gen. xxi. 15 it is clearly implied that Ishmael has been *carried* by his mother, yet according to xvi. 16, xxi. 5, 8, he must have been at least 15 years old. (*c*) In Gen. xxvii. Isaac is to all appearance on his deathbed (cf. ver. 2), yet according to P (xxv. 26, xxvi. 34, xxxv. 28) he survived for *eighty* years, dying at the age of 180. Ussher and others, arguing back from the dates in xlvii. 9, xlv. 6, xli. 46, xxxi. 41, infer that Jacob's flight to Haran took place in his 77th year. This reduces the 80 years to 43 years, though that is scarcely less incredible. It involves, moreover, the incongruity of supposing that *thirty-seven* years elapsed between Esau's marrying his Hittite wives (xxvi. 34) and Rebekah's expressing her apprehensions (xxvii. 46) lest Jacob, then aged *seventy-seven*, should follow his brother's example. (*d*) In Gen. xliv. 20 Benjamin is described as a "little one"; in P, almost immediately afterwards (xlvi. 21), he appears as the father of ten sons; for a similar anomaly in xlvi. 12, see the *Oxford Hexateuch*, i. p. 25 *n*. (ii.) The ages to which the various patriarchs lived (Abraham, 175; Isaac, 180; Jacob, 147), though not so extravagant as those of the antediluvian patriarchs, or (with one exception) as those of the patriarchs between Noah and Abraham, are much greater than is at all probable in view of the structure and constitution of the human body. (iii.) The plain intention of Ex. xii. 40, 41 is to describe the Israelites as having dwelt in Egypt for 430 years, which is also in substantial agreement with the earlier passage, Gen. xv. 13 ("shall sojourn in a land that is not theirs, . . . and they shall afflict them 400 years"). It does not, however, accord with other passages, which assign only four generations from Jacob's children to Moses (Ex. vi. 16-20; Num. xxvi. 5-9; cf. Gen. xv. 16), or five to Joshua (Josh. vii. 1); and for this reason, no doubt, the Sam. and LXX. read in Ex. xii. 40, "The sojourning of the children of Israel in the land of Egypt, *and in the land of Canaan*, was 430 years," reducing the period of the sojourn in Egypt to half of that stated in the Hebrew text, viz., 215 years. This computation attained currency among the later Jews (Josephus and others; cf. the "400 years" of Gal. iii. 17). The forced and unnatural rendering of Ex. xii. 40 in the A.V. (contrast R.V.), which was followed by Ussher, is intended for the purpose of making it possible. (iv.) The interval between Abraham and the Exodus appears to be greater than is permitted by the synchronisms with external history. It is difficult (see below) to place the Exodus much earlier than *c.* 1200 B.C. If, however, the Amraphel of Gen. xiv. is rightly identified by scholars with the Babylonian king Khammurabi (whose reign is assigned variously by Assyriologists to dates ranging between 2376-2333 B.C. to 2120-2065 B.C.),[1] and if, further, the part ascribed to Abraham in the same chapter is historical, the interval between Abraham's entry into Canaan and the Exodus cannot be less than *c.* 900 years, and may very possibly be more, as against the 645 years allowed by the Hebrew text, or the still shorter period of 430 years allowed by Ussher's computation. From the facts that have been here briefly noted it must be evident how precarious and, in parts, how impossible the Biblical chronology of this period is. (v.) It has been observed as remarkable that 2666, the number of years (in the Hebrew text) from the Creation of Man to the Exodus is, in round numbers, just two-thirds of 4000; and the fact has suggested the inference that the figure was reached by artificial computation.

*The Date of the Exodus.*—Is it possible to determine this, even approximately, upon the basis of external *data?* (i.) The correspondence between the Egyptian governors established in different parts of Palestine and the Egyptian kings Amen-hôtep III. and IV. of the 18th dynasty, which was discovered in 1887 at Tel el-amarna, makes it evident that Palestine could not yet have been in the occupation of the Israelites. It was still an Egyptian province, and the Babylonian language, in which the correspondence is written, shows that the country must have been for a considerable time past, before it came into the possession of Egypt, under Babylonian influence. One of the kings, now, who corresponds with Amen-hôtep IV. is Burnaburiash II., king of Babylon, and Egyptologists and Assyriologists are agreed that the date of these monarchs was *c.* 1400 B.C. The conquest of Canaan, consequently, could not have taken place till after 1400 B.C. (ii.) It is stated in Ex. i. 11 that the Israelites built in Egypt for the Pharaoh two store-cities, Pithom and Raamses. The excavations of M. Naville have, however, shown that Ramses II. of the 19th dynasty was the builder of Pithom; and though the other city has not at present been certainly identified, its name is sufficient to show that he was its builder likewise. Hence the Pharaoh of the Exodus is commonly supposed to have been Ramses II.'s successor, Merenptah. Egyptian chronology is unfortunately imperfect, but Professor Petrie, who has paid particular attention to the subject, and who assigns the reign of Amen-hôtep IV. to 1383-1365 B.C., assigns Ramses II. to 1275-1208 B.C.[2] In Merenptah's fifth year the Delta was invaded by a formidable body of Libyans and other foes;[3] and it has been

[1] Early Babylonian chronology is itself, in some of its details, difficult and uncertain, the figures given in the two important dynastic lists discovered by Mr Pinches in 1874 and 1880 (see *Records of the Past*, 2nd ser. vol. i. p. 13 *ff.*) not harmonizing completely with statements made by later Assyrian and Babylonian kings as to the years which had elapsed since the reigns of certain of their predecessors. The figures in the dynastic lists would lead most naturally to such dates as 2376-2333 B.C. (Sayce, *Early Israel*, 1899, p. 281), 2342-2288 (R. W. Rogers, *Hist. of Babylonia and Assyria*, New York, 1900, i. 338—at least approximately, p. 387 *n.*), 2287-2232 (Maspero, *Struggle of the Nations*, 1897, p. 27), *c.* 2285 (L. W. King, *Encycl. Biblica*, 1899, i. 445); but other scholars argue with much force that there are errors in some of the transmitted figures, and so arrive at the dates 2248-2194 (Lehmann, *Zwei Hauptprobleme der Altor. Chronologie*, 1898, p. 99 and tab. 3), 2120-2065 (Rost, *Untersuchungen zur Altor. Gesch.* 1897, p. 23), or 2130-2087 (Hommel, *Expository Times*, x. 1898, p. 210 *f.*). On Khammurabi himself, see further Maspero, *op. cit.* pp. 39-44; and on the chronological question Rogers, *op. cit.* pp. 312-348.

[2] Petrie, *Hist. of Egypt*, i. (1895), p. 251; ii. (1897), p. 29.

[3] See Merenptah's account of the defeat of these invaders in Maspero, *op. cit.* pp. 432-437.

conjectured that the Israelites took the opportunity of escaping during the unsettlement that was thus occasioned.

Alternative dates for Ramses II.: Sayce, *Early Israel*, p. 277, 1348-1281 B.C. (the Exodus [p. 286], 1276); Maspero, *op. cit.* p. 449, *c.* 1320-1255; Lehmann, 1324-1258 (at earliest). Attempts have been made to identify the *Khabiri*, who are mentioned often in the Tel el-amarna letters as foes, threatening to invade Palestine and bring the Egyptian supremacy over it to an end, with the Hebrews. The Exodus, it has been pointed out, might then be placed under Amen-hotep II. (1490-1474 B.C., Maspero; 1449-1423, Petrie), the successor of Thothmes, and more time would be allowed for the events between the Exodus and the time of David (*c.* 1000), which, if the date given above be correct, have been thought to be unduly compressed (see Orr in the *Expositor*, March 1897, p. 161 *ff.*); but there are difficulties attaching to this view, and it has not been adopted generally by scholars.

The mention of Israel on the stele of Merenptah, discovered by Petrie in 1896 ("Israel is desolated; its seed [*or* fruit] is not"), is too vague and indefinite in its terms to throw any light on the question of the Exodus. See the discussion (with the references) in Hogarth's *Authority and Archæology*, pp. 62-65.

II. *From the Exodus to the Foundation of the Temple* (*in the fourth year of Solomon*, 1 Kings vi. 1).—In the chronological note, 1 Kings vi. 1., this period is stated to have consisted of 480 (LXX. 440) years. Is this figure correct? If the years of the several periods of oppression and independence mentioned in the Book of Judges (Judges iii. 8, 11, 14, 30; iv. 3; v. 31; vi. 1; viii. 28; ix. 22; x. 2, 3, 8; xii. 7, 9, 11, 14; xiii. 1; xv. 20; xvi. 31) be added up, they will be found to amount to 410 years; to these must be added further, in order to gain the entire period from the Exodus to the foundation of the Temple, the 40 years in the wilderness, $x$ years under Joshua and the elders (Judges ii. 7), the 20 years' judgeship of Eli (1 Sam. iv. 18), the judgeship of Samuel (perhaps 20 years; cf. 1 Sam. vii. 2), the $y$ years of Saul (the two years of Sam. xiii. 1 [R.V.] seem too few), the 40 years of David (1 Kings ii. 11), and the first four years of Solomon, *i.e.*, $144+x+y$ years, in all 554 years, + two unknown periods denoted by $x$ and $y$—in any case considerably more than the 480 years of 1 Kings vi. 1. This period might no doubt be reduced to 480 years by the supposition, in itself not improbable, that some of the judges were local and contemporaneous; the suggestion has also been made that, as is usual in Oriental chronologies, the years of foreign domination were not counted, the beginning of each judge's rule being reckoned, not from the victory which brought him into power, but from the death of his predecessor; we should in this case obtain for the period from the Exodus to the foundation of the Temple $440+x+y$ years,[1] which if 30 years be assigned conjecturally to Joshua and the elders, and 10 years to Saul, would amount exactly to 480 years. The terms used, however ("and the land *had rest* forty years," iii. 11; similarly, iii. 30; v. 31; viii. 28), seem hardly to admit of the latter supposition; and even if they did, it would still be scarcely possible to maintain the correctness of the 480 years: it is difficult to harmonize with what, as we have seen, appears to be the most probable date of the Exodus; it is, moreover, open itself to the suspicion of having been formed artificially, upon the assumption that the period in question consisted of twelve generations[2] of 40 years each. In the years assigned to the different judges, also, the frequency of the number 40 (which certainly appears to have been regarded by the Hebrews as a round number) is suspicious. On the whole no certain chronology of this period is at present attainable.[3]

III. *From the Fourth Year of Solomon to the Captivity of Judah.*—During this period the dates are both more abundant, and also, approximately, far more nearly correct, than in any of the earlier periods; nevertheless in details there is still much uncertainty and difficulty. The Books of Kings are a compilation made at about the beginning of the Exile, and one object of the compiler was to give a consecutive and complete chronology of the period embraced in his work. With this purpose in view, he not only notes carefully the length of the reign of each king in both kingdoms, but also (as long as the northern kingdom existed) brings the history of the two kingdoms into relation with one another by equating the commencement of each reign in either kingdom with the year of the reign of the contemporary king in the other kingdom.

The following are examples of the standing formulæ used by the compiler for the purpose:—"In the twentieth year of Jeroboam king of Israel began Asa to reign over Judah. And forty and one years reigned he in Jerusalem" (1 Kings xv. 9, 10). "In the third year of Asa king of Judah began Baasha the son of Ahijah to reign over all Israel in Tirzah, (and reigned) twenty and four years" (*ibid.* ver. 33).

In these chronological notices the lengths of the reigns were derived, there is every reason to suppose, either from tradition or from the state annals—the "book of the chronicles of Israel" (or "Judah"), so constantly referred to by the compiler as his authority (*e.g.*, 1 Kings xv. 23, 31; xvi. 5); but the "synchronisms"—*i.e.*, the corresponding dates in the contemporary reigns in the other kingdom—were derived, it is practically certain, by computation from the lengths of the successive reigns. Now in some cases, perhaps, in the lengths of the reigns themselves, in other cases in the computations based upon them, errors have crept in, which have vitiated more or less the entire chronology of the period. The existence of these errors can be demonstrated in two ways: (1) The chronology of the two kingdoms is not consistent with itself; (2) the dates of various events in the history, which are mentioned also in the Assyrian inscriptions, are in serious disagreement with the dates as fixed by the contemporary Assyrian chronology.

(1) That the chronology of the two kingdoms is inconsistent with itself is readily shown. After the division of the kingdom the first year of Jeroboam in Israel coincides, of course, with the first year of Rehoboam in Judah; and after the death of Jehoram of Israel and Ahaziah of Judah in battle with Jehu (2 Kings ix. 24, 27), the first year of Jehu in Israel coincides similarly with the first year of Athaliah in Judah: there are thus in the history of the two kingdoms two fixed and certain synchronisms. Now, if the regnal years of the kings of Israel from Jeroboam to Jehoram be added together, they will be found to amount to 98, while if those of the kings of Judah for the same period (viz., from Rehoboam to Ahaziah) be added together, they amount only to 95. This discrepancy, if it stood alone, would not, however, be serious. But when we proceed to add up similarly the regnal years in the two kingdoms from the division after Solomon's death to the fall of Samaria in the sixth year of Hezekiah (2 Kings xviii. 10), we find in the southern kingdom 260 years, and in the northern kingdom only 241 years 7 months. This is a formidable discrepancy. Ussher, in order to remove it, has recourse to the doubtful

[1] Namely, 40 years in the wilderness; Joshua and the elders (Judges ii. 7), $x$ years; Othniel (iii. 11), 40 years; Ehud (iii. 30), 80 years; Barak (v. 31), 40 years; Gideon (viii. 28), 40 years; Jephthah and five minor judges (x. 2, 3; xii. 7, 9, 11, 14), 76 years; Samson (xvi. 31), 20 years; Eli (1 Sam. iv. 18), 40 years; Samuel (vii. 2), 20 years; Saul, $y$ years; David, 40 years; and Solomon's first four years, —in all $440+x+y$ years.

[2] Namely, Moses (in the wilderness), Joshua, Othniel, Ehud, Deborah, Gideon, Jephthah, Samson, Eli, Samuel, Saul, and David.

[3] The "300 years" of Judges xi. 26 agrees very nearly with the sum of the years (namely, 319) given in the preceding chapters for the successive periods of oppression and independence. The verse occurs in a long insertion (xi. 12-28) in the original narrative; and the figure was most probably arrived at by computation upon the basis of the present chronology of the book.

expedient of artificially lengthening the northern series of years, by assuming (without any authority in the text) an "interregnum of 11 years" after the death of Jeroboam II., and an "anarchy for some years" between Pekah and Hoshea (see the margin of A.V. at 2 Kings xiv. 29; xv. 8, 29).

(2) As we now know, the methods of chronological computation adopted by the Assyrians were particularly exact. Every year a special officer was appointed, who held office for that year, and gave his name to the year; and "canons," or lists, of these officers have been discovered, extending from 893 to 666 B.C.[1] The accuracy of these canons can in many cases be checked by the full annals which we now possess of the reigns of many of the kings—as of Asshur-nazir-abal (885-860 B.C.), Shalmaneser II. (860-825), Tiglath-pileser III. (745-727), Sargon (722-705), Sennacherib (704-781), Esarhaddon (681-668), and Asshurbanipal (668-626). Thus from 893 B.C. the Assyrian chronology is certain and precise. Reducing now both the Assyrian and Biblical dates to a common standard,[2] and adopting for the latter the computations of Ussher, we obtain the following singular series of discrepancies:—

| | Dates according to Ussher's Chronology. B.C. | Dates according to Assyrian Inscription. B.C. |
|---|---|---|
| Reign of Ahab | 918-897 | |
| Ahab mentioned at the battle of Karkar | ... | 854 |
| Reign of Jehu | 884-856 | |
| Jehu pays tribute to Shalmaneser II. | ... | 842 |
| Reign of Menahem | 772-761 | |
| Menahem mentioned by Tiglath-pileser III. | ... | 738 |
| Reign of Pekah | 759-739 | |
| Reign of Hoshea | 730-721 | |
| Assassination of Pekah and succession of Hoshea, mentioned by Tiglath-pileser III. | ... | 733 (or 732)[3] |
| Capture of Samaria by Sargon in Hezekiah's sixth year (2 Kings xviii. 10) | 721 | 722 |
| Invasion of Judah by Sennacherib in Hezekiah's fourteenth year (ibid. ver. 13) | 713 | 701 |

Manifestly all the Biblical dates earlier than 733-32 B.C. are too high, and must be considerably reduced: the two events, also, in Hezekiah's reign—the fall of Samaria and the invasion of Sennacherib—which the compiler of the Book of Kings treats as separated by an interval of *eight* years, were separated in reality by an interval of *twenty-one* years.[4]

Much has been written on the chronology of the kings and many endeavours have been made to readjust the Biblical figures so as to bring them into consistency with themselves and at the same time into conformity with the Assyrian dates. But, though the fact of there being errors in the Biblical figures is patent, it is not equally clear at what points the error lies, or how the available years ought to be redistributed between the various reigns. It is in any case evident that the accession of Jehu and Athaliah must be brought down from 884 to 842 B.C.; and this will involve, naturally, a corresponding reduction of the dates of the previous kings of both kingdoms, and of course, at the same time, of those of Solomon, David, and Saul. The difficulty is, however, greatest in the 8th century. Here, in Judah, from the accession of Athaliah to the accession of Ahaz, tradition gives 143 years, whereas, in fact, there were but 106 years (842-736); and in Israel, from the death of Menahem to the fall of Samaria, it gives 31 years, whereas from 738 (assuming that Menahem died in that year) to 722 there are actually only 16 years. The years assigned by tradition to the reigns in both kingdoms in the middle part of the 8th century B.C. have thus to be materially reduced. But in the following period, from the fall of Samaria in 722 to the capture of Jerusalem by the Chaldæans in 586, the Biblical dates, so far as we can judge, are substantially correct. (See further the table beginning below.)

IV. *From the Destruction of Jerusalem in 586 to the close of the Old Testament History.*—Here, though it is true that there are events in the Biblical history which are not fully or unambiguously dated, there is otherwise no difficulty. The lengths of the reigns of Nebuchadnezzar and his successors on the throne of Babylon, and also, after the conquest of Babylon, of Cyrus and the following Persian kings, are known from the "Canon of Ptolemy," referred to above, the particulars in which, for the earlier part of this period, are also confirmed by the testimony of the monuments.

[1] See George Smith, *The Assyrian* [illegible] (1875), pp. 29 *ff.*, 57 *ff.*; Schrader, *Keilinschriftliche* [illegible] ... tions of Assyrian and Babylonian inscriptions), i. (1889), p. 204 *ff.*

[2] It may be explained here that the dates of the Assyrian and Babylonian kings can be reduced to years B.C. by means of the so-called "Canon of Ptolemy," which is a list of the Babylonian and Persian kings, with the lengths of their reigns, extending from Nabonassar, 747 B.C., to Alexander the Great, drawn up in the 2nd century A.D. by the celebrated Egyptian mathematician and geographer Ptolemy: as the dates B.C. of the Persian kings are known independently, from Greek sources, the dates B.C. of the preceding Babylonian kings can, of course, be at once calculated by means of the Canon. The recently-discovered contemporary monuments have fully established the accuracy of the Canon.

[3] Or, in any case, between 734 and 732; see Rost, *Die Keilschrifttexte Tiglathpilesers III.*, 1893, pp. xii. 39, 81, with the discussion, pp. xxxii.-xxxiv., xxxv.-xxxvi.

[4] This interval does not depend upon a mere list of Eponym years; we have in the annals of Sargon and Sennacherib full particulars of the events in all the intervening years.

CHRONOLOGICAL TABLE.

*The dates printed in black type are certain, at least within a unit.*

| Chronology of Ussher. | Probable Real Dates. | Biblical Events. | Events in Contemporary History. Babylonia. | Assyria. | Egypt.[3] |

[1] So Sayce, Rogers, and others. The date rests upon a statement of Nabu-na'id's, that Sargon reigned 3200 years before himself. Lehmann holds that there are reasons for believing that the engraver, by error, put a stroke too many, and that 2200 should be read instead of 3200.

[2] The real Biblical dates, Ussher in Gen. xi. 26 interpolating 60 years, because it is said in Acts vii. 4 that Abraham left Haran *after* his father Terah's death (Gen. xi. 32), and also (as explained above) interpreting wrongly Ex. xii. 40.

[3] Rogers, i. 373-75 (where Ur-bau is called Ur-gur).

[4] See p. 75, *n.* Many monuments and inscriptions of other kings in Babylonia, between B.C. 4000 and 2100 are also known.

[5] The dates of the kings are, in most cases, those given by Kautzsch in the table in his *Outline of the History of the Literature of the O. T.* (tr. by Taylor, 1898) p. 167 *ff.* The dates given by other recent authorities seldom differ by more than three or four years.

[6] The figures after a king's name indicate the number of years assigned to his reign in the Old Testament. For Saul, see 1 Sam. xiii. 2, R.V.

[7] If these dates are correct, there must be some error in the ages assigned to Ahaz and Hezekiah at their accession, viz., 20 and 25 respectively, for it would otherwise follow from them that Ahaz was born when his father was not more than 4 years old! The date 727 for Hezekiah's accession rests upon the assumption that of the two inconsistent dates (see p. 77) in 2 Ki. xviii. 10, 13, the one in ver. 10 (which places the fall of Samaria in Hezekiah's 6th year) is correct; but some scholars (as Wellhausen, Kamphausen, and Stade) suppose that the date in ver. 10 (which places Sennacherib's invasion in Hezekiah's 14th year) is correct, and assign accordingly Hezekiah's accession to 715. This removes, or at least mitigates, the difficulty referred to, and leaves more room for the reigns of Jotham and Ahaz; but it requires, of course, a corresponding reduction in the reigns of the kings succeeding Ahaz.

CHRONOLOGICAL TABLE—*Continued.*

| Chronology of Ussher. | Biblical Events. | Events in Contemporary History. | | |
|---|---|---|---|---|
| | | Babylonia. | Assyria. | Egypt. |
| | | 721-710. The Chaldaean prince, Merodach-baladan, king of Babylon (cf. 2 Ki. xx. 12 = Is. xxxix 1) | | |

| | | 333. Persian Empire overthrown by Alexander the Great | | |

*Palestine now becomes a province, first of the empire of Alexander, and afterwards of that of one or other of Alexander's successors.*

**332.** The Jews submit to Alexander the Great.
**323.** Death of Alexander in Babylon.
**322.** Alexander's general, Ptolemy Lagi, becomes Satrap of Egypt.
**320.** Ptolemy Lagi gains possession of Palestine, which, with short interruptions, continues in the hands of the Ptolemies till 198.
**312.** Beginning of the era of the Seleucidæ (reckoned from the time when Seleucus Nicator, Alexander's former heavy cavalry officer, finally established himself in the satrapy of Babylonia. He founded Antioch as his capital, 300 B.C.).
**305.** Ptolemy Lagi assumes the title of king.
**198.** Antiochus the Great, king of Syria (223-187), defeats Ptolemy Epiphanes at Panias (Bâniyas, near the sources of the Jordan), and obtains possession of Palestine.
**175-164.** Antiochus Epiphanes, king of Syria (Dan. xi. 21-45).
**168.** Antiochus's attempt to suppress the religion of the Jews (1 Macc. i. 41-63 ; cf. Dan. vii. 8, 21, 24-26 ; viii. 9-14 ; xii. 10-12). Public worship suspended in the Temple for three years.
**167.** Rise of the Maccabees (1 Macc. ii.).
**166-165.** Victories of Judas Maccabæus over the generals of Antiochus (1 Macc. iii.-iv.).
**165.** Re-dedication of the Temple on 25th Chisleu (December), 1 Macc. iv. 52-61.
**160.** Death of Judas Maccabæus (1 Macc. ix. 1-22).
**160-142.** Jonathan, younger brother of Judas, leader of the loyal Jews (1 Macc. ix. 23-xii. 53).
**142-135.** Simon, elder brother of Judas (1 Macc. xiii.-xvi.).
**135-105.** John Hyrcanus, son of Simon.
**105-104.** Aristobulus I. (son of Hyrcanus), king.
**104-78.** Alexander Jannæus (brother of Aristobulus), king.
**78-69.** Salome (Alexandra), widow of Alexander Jannæus.
**69.** Aristobulus II. (son of Alexandra).
**65.** Capture of Jerusalem by Pompey. Palestine becomes a part of the Roman province of Syria.

See, for further information on the subject, the article CHRONOLOGY in the *Encyclopædia Biblica*, cols. 773-799, with the literature referred to on col. 819 (especially the writings of Noldeke, Wellhausen, and Kamphausen there mentioned). (S. R. D.)

## II. NEW TESTAMENT.

The subject of the chronology of the New Testament falls naturally into two distinct sections—the chronology of the Gospels, that is, of the life of Christ; and the chronology of the Acts, that is, of the apostolic age.

### *The Chronology of the Gospels.*

The data group themselves round three definite points and the intervals between them: the definite points are the Nativity, the Baptism, and the Crucifixion; the age of Christ at the time of the Baptism connects the first two points, and the duration of His public ministry connects the second and third. The results obtained under the different heads serve mutually to test, and thereby to correct or confirm, one another.

1. The date of the Nativity as fixed according to our common computation of Anni Domini (first put forward by Dionysius Exiguus at Rome early in the 6th century) has long been recognized to be too late. The fathers of the primitive church had been nearer the truth with the years 3 or 2 B.C. (see Irenæus, *Hær.* III. xxi. 3 [xxiv. 2]; Clement of Alexandria, *Strom.* i. 21, p. 147 ; Hippolytus, *in Danielem*, iv. ed. Bonwetsch, p. 242 ; [Tertullian], *adv. Judæos*, 8). What may be called the received chronology during the last two centuries has pushed the date farther back to 4 B.C. But the considerations now to be adduced make it probable that the true date is earlier still.

(*a*) *Evidence of St Matthew's Gospel* (i. 18-ii. 22).—The birth of Christ took place before the death of Herod, and the evidence of Josephus fixes the death of Herod, with some approach to certainty, in the early spring of 4 B.C. Josephus, indeed, while he tells us that Herod died not long before Passover, nowhere names the exact year; but he gives four calculations which serve to connect Herod's death with more or less known points, namely, the length of Herod's own reign, both from his *de jure* and from his *de facto* accession, and the length of the reigns of two of his successors, Archelaus and Herod Philip, to the date of their deposition and death respectively. The various calculations are not quite easy to harmonize, but the extent of choice for the year of Herod's death is limited to the years 4 and 3 B.C., with a very great preponderance of probability in favour of the former. How long before this the Nativity should be placed the Gospel does not enable us to say precisely, but as Herod's decree of extermination included all infants up to two years of age, and as a sojourn of the Holy Family in Egypt of unknown length intervened between the massacre and Herod's death, it is clear that it is at least possible, so far as the evidence of this Gospel goes, that the birth of Christ preceded Herod's death by as much as two or three years. What is thus shown to be possible would, of course, be necessary if we went on, with the astronomer Kepler, to identify the star of the Magi with the conjunction of the planets Jupiter and Saturn which occurred, in the constellation Pisces, in May, October, and December of 7 B.C.[1]

(*b*) *Evidence of St Luke's Gospel* (ii. 1-8).—The birth of Christ took place at the time of a general census of the empire ordered by Augustus: "it was the first census, and was made at the time when Quirinius was governor of Syria." Against this account it has been urged that we know that the governorship of Syria from 10 or 9 B.C. down to and after Herod's death was held successively by M. Titius, C. Sentius Saturninus, and P. Quintilius Varus; and further, that when Judæa became a Roman province on the deposition of Archelaus in A.D. 6, Quirinius was governor of Syria, and did carry out an elaborate census. The notice in the Gospel, it is suggested, grew out of a confused recollection of the later (and only historical) census, and is devoid of any value whatever. At the other extreme Prof. W. M. Ramsay (*Was Christ Born at Bethlehem?* 1898, p. 149 *ff.*) defends the exact accuracy of St Luke's "first census" as witnessing to the (otherwise of course unknown) introduction into Syria of the periodic

[1] It is a curious coincidence that a mediæval Jew, R. Abarbanel, records that the conjunction of these particular planets in this particular constellation was to be a sign of Messiah's coming. It is just conceivable that his statement may ultimately depend on some such ancient tradition as may have been known to Chaldean magi.

fourteen years' census which the evidence of papyri has lately established for Egypt, at least from A.D. 20 onwards. Reckoning back from A.D. 20, the periodic census should fall in 9 B.C., but Ramsay alleges various causes for delay, which would have postponed the actual execution of the census till 7 B.C., and supposes that Quirinius was an imperial commissioner specially appointed to carry it out. The truth seems to rest midway between these extremes. St Luke's statement of a general census is in all probability erroneous, and the introduction of the name Quirinius appears to be due to confusion with the census of A.D. 6. But the confusion in question would only be possible, or at any rate likely, if there really was a census at the time of the Nativity; and it is no more improbable that Herod should have held, or permitted to be held, a local census than that Archelaus of Cappadocia in the reign of Tiberius (Tacitus, *Ann.* vi. 41) should have taken a census of his own native state "after the Roman manner." But St Luke's account, when the name of Quirinius is subtracted from it, ceases to contain any chronological evidence.

(*c*) *Evidence of Tertullian.*—Strangely enough, however, the missing name of the governor under whom the census of the Nativity was carried out appears to be supplied by an author who wrote more than a century after St Luke, and has by no means a good reputation for historical trustworthiness. Tertullian, in fact (*adv. Marcionem*, iv. 19), employs against Marcion's denial of the true humanity of Christ the argument that it was well known that Sentius Saturninus carried out a census under Augustus in Judæa, by consulting which the family and relationships of Christ could have been discovered. This Saturninus was the middle one of the three governors of Syria named above, and as his successor Varus must have arrived by the middle of 6 B C. at latest (for coins of Varus are extant of the twenty-fifth year of the era of Actium), his own tenure must have fallen about 8 and 7 B.C., and his census cannot be placed later than 7 or 7-6 B.C. The independence of Tertullian's information about this census is guaranteed by the mere fact of his knowledge of the governor's name; and if there was a census about that date, it would be unreasonable not to identify it with St Luke's census of the Nativity.

The traditional Western day for the Christmas festival, 25th December, goes back as far as Hippolytus, *loc. cit.*; the traditional Eastern day, 6th January, as far as the Basilidian Gnostics (but in their case only as a celebration of the Baptism), mentioned by Clement of Alexandria, *loc. cit.*

2. The interval between the Nativity and the Baptism.

*Evidence of St Luke's Gospel* (iii. 23).—At the time of His baptism Jesus was ἀρχόμενος ὡσεὶ ἐτῶν τριάκοντα, of which words two opposite misinterpretations must be avoided: (i.) ἀρχόμενος does not mean (as Valentinian interpreters thought, Iren. II. xxii. 5 [xxxiii. 3]; so also Epiphanius, *Hær.* li. 16) "beginning to be thirty years" in the sense of "not yet quite thirty," but "at the beginning of His ministry," as in Luke xxiii. 5, Acts i. 22, x. 37; (ii.) ὡσεὶ ἐτῶν τριάκοντα does not mean "on attaining the full age of thirty, before which he could not have publicly taught," for if there was by Jewish custom or tradition any minimum age for a teacher, it was not thirty, but forty (*Bab. Talm.* ed. 1715, fol. 19 *b*; Iren. *loc. cit.*). St Luke's phrase is a general one, "about thirty years old," and cannot be so pressed as to exclude some latitude in either direction.

3. The date of the Baptism.

(*a*) *Evidence of St Luke's Gospel* (iii. 1): a *terminus a quo* for the Baptism is the synchronism of the commencement of the Baptist's public ministry with the fifteenth year of the rule (ἡγεμονία) of Tiberius. Augustus died on 19th August, A.D. 14, and, reckoned from that point, Tiberius's fifteenth year might be, according to different methods of calculation, either A.D. 28, or 28-29, or 29. None of these alternatives would be at all easy to reconcile with the results yielded by other lines of investigation in this article, and the choice seems to lie between the following views: (i.) The years of Tiberius are here reckoned from some earlier starting-point than the death of his predecessor—probably from the grant to him of co-ordinate authority with Augustus over the provinces made in A.D. 11 (see, for the parallel with the case of Vespasian and Titus, Ramsay, *St Paul the Roman Traveller*, p. 387), so that the fifteenth year would be roughly A.D. 25; or (ii.) St Luke has made here a second error in chronology, caused perhaps in this case by reckoning back from the Crucifixion, and only allowing one year to the ministry of Christ.

(*b*) *Evidence of St John's Gospel* (ii. 13, 20): a *terminus ad quem* for the Baptism is the synchronism of the first Passover mentioned after it with the forty-sixth year of the building of Herod's Temple. Herod began the Temple in the eighteenth year of his reign, probably 20-19 B.C., and the Passover of the forty-sixth year is probably that of A.D. 27. While too much stress must not be laid on a chain of reasoning open to some uncertainty at several points, it is difficult to suppose with Loisy, *Revue d'histoire et de littérature religieuses*, 1900, p. 536, that the number was intended by the evangelist as purely figurative, and is therefore destitute of all historical meaning.

On the whole, the Baptism of Christ should probably be placed in A.D. 26-27; and as the Nativity was placed in 7-6 B.C. (at latest), this would make the age of Christ at His Baptism to be about thirty-two, which tallies well enough with St Luke's general estimate.

4. The interval between the Baptism and the Crucifixion, or, in other words, the duration of the public ministry of Christ.

(*a*) *Evidence of the Synoptic Tradition and of St Mark's Gospel* (ii. 23, vi. 39, xiv. 1). The order of events in the primitive synoptic tradition appears to be faithfully reproduced in St Mark; and if this order is chronological, Christ's ministry lasted at least two years, since the plucking of the ears of corn (April-June) marks a first spring; the feeding of the five thousand when the grass was fresh green (χλωρός: about March), a second; and the Passover of the Crucifixion a third: and these three points are so far removed from one another in the narrative that the conclusion would hold, even if the general arrangement in St Mark were only roughly, and not minutely, chronological. On the other hand, it may be true that an impression of a briefer period of ministry naturally results, and in early generations did actually result, from the synoptic account considered as a whole.

(*b*) *Evidence of St Luke's Gospel* (ix. 51-xix. 28 compared with iv. 14-ix. 50; iv. 19). Still stronger is the impression of brevity suggested by St Luke. The second and larger half of the narrative of the ministry is introduced at ix. 51 with the words, "It came to pass as the days of His assumption were coming to the full, He set His face firmly to go to Jerusalem," under which phrase the evangelist cannot have meant to include more than a few months, perhaps not more than a few weeks; so that even if the earlier and shorter half of the account, which describes a purely Galilean ministry ("Judæa" in iv. 44, if it is the true reading, means Judæa in the sense of Palestine), is to be spread over a longer period of time, the combined narrative can hardly have been planned on the scale of more than a single year. St Luke himself may have understood literally, like so many of his readers in ancient times, the reference which he records to the

"acceptable year of the Lord" (iv. 19 = Isaiah lxi. 2): see, too, above, 3 (*a*) *ad fin.*

(*c*) *Evidence of St John's Gospel* (ii. 13, "the Passover of the Jews was near," and 23, "He was in Jerusalem at the Passover at the feast"; v. 1, "after these things was a feast [or, 'the feast'] of the Jews"; vi. 4, "and the Passover, the feast of the Jews, was near"; vii. 2, "and the feast of the Jews, the Tabernacles, was near"; x. 22, "at that time the feast of dedication took place at Jerusalem"; xi. 55, "and the Passover of the Jews was near": besides iv. 35, "say ye not that there is yet a period of four months and harvest cometh? behold, I tell you, lift up your eyes and see the fields that they are white to harvest"). This catena of time-references is of course unique in the Gospels as a basis for a chronology of the ministry; and it is not reasonable to doubt (with Loisy, *loc. cit.*, who suggests that the aim was to produce an artificial correspondence of a three and a half years' ministry with the half-week of Daniel; but many and diverse as are the early interpretations of Daniel's seventy weeks, no one before Eusebius thought of connecting the half-week with the ministry), that the evangelist intended these notices as definite historical *data*, possibly for the correction of the looser synoptic narratives and of the erroneous impressions to which they had given rise. Unfortunately, difficulties, either (i.) of reading, or (ii.) of interpretation, or (iii.) of arrangement, have been raised with regard to nearly all of them; and these difficulties must be briefly noticed here.

(i.) *Readings* (α) v. 1, ἑορτή A B D, Origen, Epiphanius, Chrysostom, *Paschal Chronicle*; ἡ ἑορτή ℵCLΔ 1-118, 33, the Egyptian versions, Eusebius, Cyril-Alex. (Irenæus?). The balance of internal evidence—copyists being more likely to accentuate than to diminish the precision of a note of time—inclines, like the balance of external evidence, against the article. (β) vi. 4, τὸ πάσχα is read by all known MSS. and versions; but it has been argued by Hort (in Westcott's and Hort's *New Testament in Greek*, appendix, pp. 77-81) that four ancient authorities omitted the words, and that their omission simplifies the whole chronology, since "the feast" which was "near" in vi. 4 would then be identical with the feast of Tabernacles mentioned in vii. 2, and all the time-notices of the Gospel could be arranged to fall within the space of a single year, between the Passover of ii. 13 and the Passover of xi. 55. But of the four authorities alleged, Irenæus (II. xxii. 3 [xxxiii. 1]) and the Alogi (*ap.* Epiphanius, *Hær.* li. 22) were giving catalogues of Passovers "observed" by Christ (at Jerusalem), and therefore naturally omitted a mere chronological reference like vi. 4: Cyril of Alexandria, in so far as his evidence is adverse to the words, appears to be incorporating a passage from the *Commentary* of Origen, not extant *in loc.*; and the only writer who perhaps really did omit the words—with the view, no doubt, of reconciling the witness of the fourth Gospel with the then widely-spread tradition of the single-year ministry—is Origen himself.

(ii.) *Interpretation* (α) iv. 35: which is to be taken literally, the "four months to harvest" (about January), or the "fields white to harvest" (about May)? It does not seem possible to rule out either interpretation; the choice between them will follow from the view taken of the general chronological arrangement of the Gospel. (β) v. 1: if "the feast" is read, a choice remains between Passover and Tabernacles (the definite article would not be very definite after all); if the more probable "a feast," the greater feasts are presumably excluded, but a choice remains between, at any rate, Pentecost (May), Trumpets (September), Dedication (December), and Purim (February). Here again the decision will follow on the general chronological arrangement which may be adopted.

(iii.) *Arrangement.*—So far the amount of possible latitude left is not so great as to obscure the main outline of the chronology. For a first (ii. 13, 20), second (vi. 4), and third (xi. 55) Passover are established, with two indeterminate notices (iv. 35, v. 1) between the first and second, and two determinate notices (vii. 2 Tabernacles in October, x. 22 Dedication in December) between the second and third. But of late years an increasing desire has been manifested, especially in Germany and America, to manipulate the fourth Gospel on grounds of internal evidence, at first only in the way of particular transpositions of more or less attractiveness, but latterly also by schemes of thoroughgoing rearrangement. The former class of proposals will, however, as a rule hardly affect the chronology of the Gospel; the latter will affect it vitally. The distinction here drawn may be illustrated from the earliest instance of the former and the latest of the latter. In 1871 Archdeacon J. P. Norris (*Journal of Philology*) wished to transpose chapters v. and vi.—ch. vi. was, like ch. xxi., a Galilean appendix, and was inserted by mistake at somewhat too late a point in the body of the Gospel—and to read "the feast" in v. 1, identifying it with the Passover which was near in vi. 4: in any case, whether "the feast" = Passover, or "a feast" = Pentecost, were read in v. 1, the transposition would not affect the two years' ministry. In 1900 Prof. B. W. Bacon (*American Journal of Theology*, p. 770) proposed a rearrangement of the whole Gospel, according to which the time-notices would occur in the following order: vi. 4, Passover is near; iv. 35, the fields white to harvest = May; v. 1, "a feast" = Pentecost; vii. 2, Tabernacles; x. 22, Dedication; xi. 55, Passover is near; xii. 1, Jesus at Bethany six days before Passover; ii. 13, Passover is near and Jesus goes up to Jerusalem (ii. 23, an interpolation) for the Passover of the Crucifixion; and the ministry would thus be reduced to a single year. Such a scheme does not lend itself to discussion here; but as far as evidence is at present obtainable, the conclusion that St John drew up his narrative on the basis of a two years' rather than a one year's ministry appears to be irrefragable.

Not only do the fourth and second Gospels thus agree in indications of a two years' ministry, but the notes of the middle spring of the three (John vi. 4, Mark vi. 39) both belong to the feeding of the 5000, one of the few points of actual contact between the two Gospels.

The question, however, may still be raised, whether these time-indications of the two Gospels are exhaustive, whether (that is) two years, and two years only, are to be allotted to the ministry. Irenæus (II. xxii. 3-6 [xxxiii. 1-4]), in favour of a ministry of not less than ten years, appeals (i.) to the tradition of Asia Minor; (ii.) to the record in St John that Christ, who was thirty years old at the time of His baptism, was addressed by the Jews as "not yet [*i.e.* nearly] fifty years old": but both his arguments are probably derived from a single source, Papias's interpretation of John viii. 57. With this exception, however, all ancient writers, whether they enumerated two or three or four Passovers in the Gospel history, believed that the enumeration was exhaustive; and their belief appears correctly to represent the mind of St John, whose notes of time were probably in intentional contrast to the looser synoptic accounts. Moreover, the wide currency in early times of the tradition of the single-year ministry (Ptolemæus, *ap.* Iren. *loc. cit.*; *Clementine Homilies*, xvii. 19; Clem. Alex. *Strom.* i. 145, vi. 279; Julius Africanus, *ap.* Routh, *Rell. Sacr.* ii. 240, 306; Hippolytus, *Paschal Cycle* and *Chronicle*; Origen *in Levit. Hom.* ix. 5, *de Principiis*, iv. 5) becomes more difficult to account for the farther it is removed from the actual facts.

5. The date of the Crucifixion.

(*a*) *The Roman Governor.*—Pontius Pilate was on his way back to Rome, after ten years of office, when Tiberius died on 16th March A.D. 37 (Josephus, *Ant.* XVIII. ii. 2, iv. 2). Luke xiii. 1, xxiii. 12, show that he was not a newcomer at the time of the Crucifixion. For the Crucifixion "under Pontius Pilate" the Passover of A.D. 28 is therefore the earliest possible and the Passover of A.D. 36 the latest.

(*b*) *The Jewish High-Priest.*—Caiaphas was appointed before Pilate's arrival, and was deposed at a Passover apparently not later than that of the year of Herod Philip's death, A.D. 34 (*Ant.* XVIII. ii. 2, iv. 3-v. 3). The Crucifixion at some previous Passover would then fall not later than A.D. 33.

(*c*) *The Day of the Week.*—The Resurrection on "the first day of the week" (Sunday) was "on the third day" after the Crucifixion; and that "the third day" implies an interval of only two days hardly needed to be shown, but has been shown to demonstration in Field's *Notes on the Translation of the New Testament* (on Matt. xvi. 21). The Crucifixion was therefore on a Friday in some year between A.D. 28 and 33 inclusive.

(*d*) *The Day of the Jewish Month Nisan.*—The Passover was kept at the full moon of the lunar month Nisan, the first of the Jewish year; the Paschal lambs were slain on the afternoon of the 14th, and the Passover was eaten after sunset the same day—which, however, as the Jewish day began at sunset, was by their reckoning the 15th; the first fruits (of the barley harvest) were solemnly offered on the 16th. The synoptic Gospels appear to place the Crucifixion on the 15th, since they speak of the Last Supper as a Passover; St John's Gospel, on the other hand (xiii. 1, 29, xviii. 28), distinctly implies that the feast had not yet taken place, and thus makes the Crucifixion fall on the 14th. Early Christian tradition is unanimous on this side; either the 14th is mentioned, or the Crucifixion is made the antitype of the slaughter of the Paschal Lamb (and the resurrection of the first fruits), in the following authorities anterior to A.D. 235: St Paul, 1 Cor. v. 7, xv. 20; Quartodecimans of Asia Minor, who observed the Crucifixion on the "14th," no matter on what day of the week it fell; Claudius Apollinaris, Clement of Alexandria, Hippolytus, all three quoted in the *Paschal Chronicle;* Irenæus (apparently) IV. x. 1 [xx. 1]; [Tertullian] *adv. Judæos*, 8; Africanus, in Routh, *Rell. Sacr.* ii. 297. The Crucifixion, then, should be placed rather on the 14th than on the 15th of Nisan.

These four lines of inquiry have shown that the Crucifixion fell on Friday, Nisan 14 (less probably 15), in one of the six years 28-33 A.D.; and therefore, if it is possible to discover (i.) exactly which moon or month was reckoned each year as the moon or month of Nisan, and (ii.) exactly on what day that particular moon or month was reckoned as beginning, it will, of course, be possible to tell in which of these years Nisan 14 (or 15) fell on a Friday. To neither question can an answer be given in terms so precise as to exclude some latitude, but to both with sufficient exactness to rule out at once three of the six years. (i.) The difficulty with regard to the month is to know how the commencement of the Jewish year was fixed —in what years an extra month was intercalated before Nisan. If the Paschal full moon was, as in later Christian times, the first after the spring equinox, the difficulty would be reduced to the question on what day the equinox was reckoned. If, on the other hand, it was, as in ancient Jewish times, the first after the earliest ears of the barley harvest would be ripe, it would have varied with the forwardness or backwardness of the season from year to year. (ii.) The difficulty with regard to the day is, quite similarly, to know what precise relation the first day of the Jewish month bore to the astronomical new moon. In later Christian times the Paschal month was calculated from the astronomical new moon; in earlier Jewish times all months were reckoned to begin at the first sunset when the new moon was visible, which in the most favourable circumstances would be some thirty-six hours later than the astronomical new moon.

Direct material for answering the question when and how far astronomical calculations replaced simple observations as the basis of the Jewish kalendar is not forthcoming. Jewish traditions represented the Sanhedrim as retaining to the end its plenary power over the kalendar, and as still fixing the first day of every month and the first month of every year. But as it is quite inconceivable that the Jews of the Dispersion should not have known beforehand at what full moon they were to present themselves at Jerusalem for the Passover, it must be assumed as true in fact, whether or no it was true in theory, that the old empirical methods must have been qualified by permanent, that is in effect by astronomical, rules for the commencement of years and months. The first of each month was within a certain limit from the astronomical new moon. Nisan was fixed with reference to the equinox, though with regard to the day of the equinox it must be remembered (i.) that even of Christian calculations, while the Alexandrine reckoning in the 4th century adopted 21st March, Anatolius in A.D. 277 had employed 19th March, and Hippolytus in A.D. 221 18th March; (ii.) that Christian controversialists from Anatolius onwards accused the Jews of disregarding the (Christian) equinoctial limit, and of sometimes placing the Paschal full moon before it; the Jewish equinox may therefore have gone back even as far as 17th March. In the following table the first column gives the *terminus paschalis*, or 14th of the Paschal moon, according to the present Christian kalendar; the second gives the 14th, reckoned from the time of the astronomical new moon of Nisan; the third the 14th, reckoned from the first appearance of the new moon at sunset. Alternative moons are given for A.D. 29, according as the full moon falling about 18th March is or is not reckoned after the equinox.

| ,, 33 | W. Ap. 1 | Ap. 1-2 | Ap. (2–) 3 or (3–) 4 |

The first and third columns may safely be taken to represent the possible extremes for Nisan 14, so that it will be seen at once that Friday cannot have fallen on Nisan 14th or 15th in any of the three years A.D. 28, 31, and 32. The choice is narrowed down to A.D. 29, Friday 18th March (Friday 15th April would probably be too early even for Nisan 14); A.D. 30, Friday 7th April; and A.D. 33, Friday 3rd April.

(*e*) *The Civil Year* (consuls, or regnal years of Tiberius) in early Christian tradition. It is not *à priori* improbable that the year of the central event from which the Christian Church dated her own existence should have been noted in the apostolic age and handed down to the memory of succeeding generations; and the evidence does go some way to suggest that we have in favour of A.D. 29, the consulate of the two Gemini (15th or 16th year of Tiberius), a body of tradition independent of the Gospels and ancient, if not primitive, in origin.

The earliest witness, indeed, who supplies material for a definite date for the Crucifixion gave not 29, but 33 A.D. The pagan chronicler, Phlegon, writing in the reign of Hadrian, noted under Olympiad 202·4 (= A.D. 32-33), besides a great earthquake in Bithynia, an eclipse so phenomenal that it became night "at the sixth hour of the day." The eclipse meant is, of course, that of the Crucifixion (so Origen, *contra Celsum*, ii. 33 [but see *in Matt.* 134, Delarne iii. 922], Eusebius's *Chronicle* Tib. 19 [= A.D. 33], Anon. in Cramer's *Catena in Matt.* p. 237), but as the notice of it was clearly derived by Phlegon, pagan as he was, directly or indirectly from the Gospel narrative, there is no reason at all to ascribe any independent value to the date. Phlegon may have had grounds for dating the Bithynian earthquake in that year, and have brought the dateless portent into connexion with the dated one. Eusebius adopted and popularized this date, which fell in with his own system of Gospel chronology, but of the year 33 as the date of the Passion there is no vestige in Christian tradition before the 4th century.

The only date, in fact, which has any real claim to represent Christian tradition independent of the Gospels, is the year 29. Tiberius 15 is given by Clem. Alex. *Strom.* i. 147; Origen, *Hom. in Jerem.* xiv. 13; cf. *c. Cels.* iv. 22. Tiberius 16 by Julius Africanus (Routh, *Rell. Sacr.* ii. 301-304), and pseudo-Cyprian *de pascha*

*computus* (A.D. 243), § 20. The consulship of the two Gemini by Lactantius *Div. Inst.* IV. x. 18, and (Lactantius?) *de morte pers.* § 2; the consulship of the two Gemini = Tiberius 18 by Hippolytus *Comm. in Danielem*, iv. (ed. Bonwetsch, p. 242); the consulship of the two Gemini = Tiberius 15 by [Tertullian] *adv. Judæos*, § 8; the consulship of the two Gemini = Tiberius 15 (*al.* 18 or 19) = Ol. 202. 4 [this last is a later interpolation from Eusebius] in the *Acts of Pilate*. Other methods of expressing the year 29 appear in Hippolytus's *Paschal Cycle* and *Chronicle*, and in the Abgar legend (*ap.* Eusebius, *H. E.* i. 13). No doubt it would be possible to explain Tiberius 16 as a combination of Luke iii. 1 with a one year ministry, and even to treat Tiberius 15 as an unintelligent repetition from St Luke—though the omission to allow a single year for the ministry would be so strange as to be almost unintelligible—but the date by the consuls has an independent look about it, and of its extreme antiquity the evidence gives two indications: (i.) Hippolytus's Commentary on Daniel (now generally dated *c.* A.D. 200) combines it with an apparently inconsistent date, Tiberius 18; the latter is clearly his own combination of the length of the ministry (he says in the same passage that Christ suffered in His 33rd year) with Luke iii. 1—the consulship must have been taken from tradition without regard to consistency; (ii.) the names of the Gemini are divergently given in our oldest authorities; in [Tert.] *adv. Judæos* correctly as Rubellius Geminus and Fufius (or Rufius) Geminus, but in Hippolytus and the *Acts of Pilate* as Rufus and Rubellio. But if the tradition of the consulships was thus, it would seem, already an old one about the year 200, there is at least some reason to conclude that trustworthy information in early Christian circles pointed, independently of the Gospels, to the year 29 as that of the Crucifixion.

(*f*) *The Civil Month and Day.*—The earliest known calculations, by Basilidian Gnostics, quoted in Clem. Alex. *Strom.* i. 147, gave alternative dates, Thamenoth 25, Pharmuthi 25, Pharmuthi 19; that is, according to the fixed Alexandrine kalendar of B.C. 26, 21st March, 20th April, 14th April; in the older, not wholly superseded, Egyptian kalendar the equivalents with Roman days varied from year to year. But in all probability these dates were only one development of those speculations in the region of numbers to which Gnosticism was so prone; and in any case to look for genuine traditions among Egyptian Gnostics, or even in the church of Alexandria, would be to misread the history of Christianity in the 2nd century. Such traditions must be found, if anywhere, in Palestine and Syria, in Asia Minor, in Rome, not in Egypt; within the church, not among the Gnostics. The date which makes the most obvious claim to satisfy these conditions would be 25th March, as given by Hippolytus, [Tert.] *adv. Judæos*, and the *Acts of Pilate* (according to all extant MSS. and versions, but see below), *locc. citt.*—the same three authorities who bear the earliest witness for the consuls of the year of the Crucifixion—and by many later writers. It cannot be correct, since no full moon occurs near it in any of the possible years; yet it must be very early, too early to be explained with Dr Salmon (*Dictionary of Christian Biography*, iii. 92*b*), as originated by Hippolytus's Paschal cycle of A.D. 221. Now Epiphanius (*Hær.* l. 1) had seen copies of the *Acts of Pilate* in which the day given was not 25th March, but *a.d. xv. kal. Apr.* (= 18th March); and if this was the primitive form of the tradition, it is easy to see how 25th March could have grown out of it, since the 18th would from comparatively early times have been thought impossible as falling before the equinox (see above, 5 *d*), and no substitution would be so natural as that of the day week, Friday, 25th March. But Friday, 18th March A.D. 29, was one of the three alternative dates for the Crucifixion which on astronomical and kalendar grounds were found (see above, 5*d*) to be possible.

Thus A.D. 29 is the year, 18th March is the day, to which Christian tradition (whatever value, whether much or little, be ascribed to it) appears to point. Further, the Baptism was tentatively placed in A.D. 26-27; the length of the ministry was fixed, with great preponderance of probability, at something over two years; and here too the resultant date for the Crucifixion would be the Passover of A.D. 29.

To sum up: the various dates and intervals, to the approximate determination of which this article has been devoted, do not claim separately more than a tentative and probable value. But it is submitted that their harmony and convergence give them some additional claim to acceptance, and at any rate do something to secure each one of them singly—the Nativity in 7-6 B.C., the Baptism in A.D. 26-27, the Crucifixion in A.D. 29—from being widely or even appreciably in error.

*The Chronology of the Apostolic Age.*

The chronology of the New Testament outside the Gospels may be defined for the purposes of this article as that of the period between the Crucifixion in A.D. 29 (30) on the one hand, and on the other the persecution of Nero in A.D. 64 and the fall of Jerusalem in A.D. 70. Of the events in Christian history which fall between these limits it must be admitted that there are many which with our present information we cannot date with exactness. But the book of Acts, our only continuous authority for the period, contains two synchronisms with secular history which can be dated with some approach to certainty and constitute fixed points by help of which a more or less complete chronology can be constructed for at least the latter half of the apostolic age. These are the death of Herod Agrippa I. (xii. 23) and the replacement of Felix by Festus (xxiv. 27).

1. The death of Herod Agrippa I. This prince, son of Aristobulus and grandson of Herod the Great, was made (i.) king over the tetrarchy which had been Herod Philip's, "not many days" after the accession of Gaius, 16th March A.D. 37; (ii.) ruler of the tetrarchy of Antipas, in A.D. 39-40; (iii.) ruler of the whole of Palestine (with Abilene), on the accession of Claudius at the beginning of A.D. 41. Josephus's *Jewish Wars* and *Antiquities* differ by one in the number of years they allot to his reign over the tetrarchies (the former work says three years, the latter four), but agree in the more important *datum* that he reigned three years more after the grant from Claudius, which would make the latest limit of his death the spring of A.D. 44. The *Antiquities* also reckon it in the seventh year of his reign, which would suggest A.D. 43-44. On the other hand, coins whose genuineness there is no apparent reason to doubt are extant of Agrippa's ninth year; and this can only be reconciled even with A.D. 44 by supposing that he commenced reckoning a second year of his reign on Nisan 1, A.D. 37, so that his ninth would run from Nisan 1, A.D. 44. On the balance of evidence the only year which can possibly reconcile all the data appears to be A.D. 44 after Nisan, so that it will have been at the Passover of that year that St Peter's arrest and deliverance took place.

After Agrippa's death Judæa was once more governed by procurators, of whom Cuspius Fadus and Tiberius Alexander ruled from A.D. 44 to 48; the third, Cumanus, was appointed in A.D. 48; and the fourth, Felix, in A.D. 52. Under Tiberius Alexander, *i.e.*, in A.D. 46 or 47, occurred the great famine which Agabus had foretold, and in which the Antiochene church sent help to that of Jerusalem by the

ministry of Barnabas and Saul (Acts xi. 30, xii. 25). Thus the earliest date at which the commencement of the first missionary journey (Acts xiii. 4) can be placed is the spring of A.D. 47. The journey extended from Salamis "throughout the whole island" of Cyprus as far as Paphos, and on the mainland from Pamphylia to Pisidian Antioch, Iconium, Lystra, and Derbe, at each of which places indications are given of a prolonged visit (xiii. 49, xiv. 3, 6, 7, 21). The same places were visited in reverse order on the return journey, as far as Perga on the Pamphylian coast; but instead of revisiting Cyprus the voyage to Syria was this time made direct. In estimating the length of time occupied by this first missionary journey, it must be remembered that a sea voyage could never have been undertaken, and land travel only rarely, during the winter months, say November to March; and as the amount of the work accomplished is obviously more than could fall within the travelling season of a single year, the winter of 47-48 must have been spent in the interior, and return to the coast and to Syria made only some time before the end of autumn A.D. 48. The succeeding winter, at least, was spent again at Antioch of Syria (xiv. 28). The council at Jerusalem of Acts xv. will fall at earliest in the spring of A.D. 49, and as only "certain days" were spent at Antioch after it (xv. 36), the start on the second missionary journey might have been made in the (late) summer of the same year. The "confirmation" of the existing churches of Syria and Cilicia, and of those of the first journey beginning with Derbe (xv. 41, xvi. 5), cannot have been completed under several months, nor would the Apostle have commenced the strictly missionary part of the journey, in districts not previously visited, before the opening of the travelling season of A.D. 50. No delay was then made on the Asiatic side: it may still have been in spring when St Paul crossed to Europe and began the course of preaching at Philippi, Thessalonica, Berœa, and Athens which finally brought him to Corinth. The stay of eighteen months at the last-named place (xviii. 11) will naturally begin at the end of one travelling season and end at the beginning of another, *i.e.*, from the autumn of A.D. 50 to the spring of A.D. 52. From Corinth the Apostle went to Jerusalem to "salute the church," and then again to Antioch in Syria, where he stayed only for "a time" (xviii. 22), and soon left—on the third missionary journey, as conventionally reckoned—proceeding "in order" through the churches of the interior of Asia Minor. These journeys and the intervening halts must have occupied seven or eight months, and it must have been about the end of the year when St Paul established his new head-quarters at Ephesus. The stay there lasted between two and three years (xix. 8, 10, xx. 31), and cannot have terminated before the spring of A.D. 55. From Ephesus he went into Europe, and after "much teaching" given to the churches of Macedonia (xx. 2), spent the three winter months at Corinth, returning to Philippi in time for the Passover (xx. 3, 6) of A.D. 56. Pentecost of the same year was spent at Jerusalem, and there St Paul was arrested, and kept in prison at Cæsarea for two full years, until Festus succeeded Felix as governor (xx. 16, xxiv. 27), an event which, on this arrangement of the chronology of the missionary journeys, would therefore fall in A.D. 58.

Care, however, must be taken to remember exactly what this line of argument amounts to—what it can fairly be said to have proved, and what it still leaves open. It has been shown, firstly, that the missionary journeys cannot have commenced before the spring of A.D. 47, and, secondly, that between their commencement and the end of the two years' imprisonment at Cæsarea not less than eleven full years must have elapsed. Consequently A.D. 58 appears to be the earliest date possible for the arrival of Festus. On the other hand, a later date for Festus is not absolutely excluded. It is possible that the first missionary journey should be placed in A.D. 48 instead of A.D. 47; and it is possible, though not probable, that the missionary journeys should be spread over one year more than has been suggested above. At any rate, then, the alternative is open that every date given above, from A.D. 47 to A.D. 58, should be moved on one year, with the result of placing Festus's arrival in A.D. 59.

It is now time to turn to the direct evidence for the date of Festus's arrival as procurator, in order to test by it the result already tentatively obtained.

2. The replacement of Felix by Festus. This is the pivot date of St Paul's later life, but unfortunately two schools of critics date it as differently as A.D. 55 and A.D. 60 (or 61). The former are represented by Harnack, the latter by Wieseler, whom Lightfoot follows. It can be said confidently that the truth is between these two extremes (though in what exact year it is not easy to say), as will be evident from a consideration of the arguments urged, which in each case appear less to prove one extreme than to disprove its opposite.

*Arguments for the Later Date, A.D. 60 or 61.*—(α) St Paul, at the time of his arrest, two years before Felix's recall, addresses him as "for many years past a judge for this nation" (Acts xxiv. 10, 27). It is certain that Felix succeeded Cumanus in A.D. 52, for Tacitus mentions Cumanus's recall under that year; Josephus immediately before the notice of the completion of Claudius's twelfth year [January, A.D. 53]; Eusebius probably under Claudius 11, that is, between September 51 and September 52 (for the meaning of the regnal years in the *Chronicle* of Eusebius see the present writer's article in *Journal of Theological Studies*, January 1900, pp. 188-192). It is argued that "many years" cannot mean less than six or seven, so that St Paul must have been speaking at earliest in 58 or 59, and Felix will have left Judæa at earliest in 60 or 61. But this argument overlooks the fact that Felix had been in some position which might properly be described as that of "judge for this nation" before he became governor of all Palestine in A.D. 52. In the words of Tacitus, Felix was at the time of that appointment *iampridem Iudaeae impositus* (*Annals*, xii. 54); he certainly supposes Felix to have been already governor of Samaria, and apparently of Judæa too, and only recognizes Cumanus as governor of Galilee; and Josephus, though he says nothing of this, and treats Cumanus as the sole procurator down to A.D. 52, implies that Felix had been in some position where the Jewish authorities could judge of his fitness when he tells us that the high priest Jonathan used to press on Felix, as a reason for urging him to govern well, the fact that he had asked for his appointment to the procuratorship (*Ant.* XX. viii. 5). If Felix had acted in some position of responsibility in Palestine before 52 (perhaps for some time before), St Paul could well have spoken of "many years" at least as early as 56 or 57.

(β) Josephus enumerates after the accession of Nero (October 54) a long catalogue of events which all took place under the procuratorship of Felix, including the revolt of "the Egyptian" which was already "before these days" at the time of St Paul's arrest, two years from the end of Felix's tenure. This suggests, no doubt, that the Egyptian rebelled at earliest in 54-55, and makes it probable that St Paul's arrest did not take place before (the Pentecost of) A.D. 56; and it implies certainly that the main or most important part of Felix's governorship fell, in Josephus's view, under Nero. But as two years only of Felix's rule (52-54) fell under Claudius, this procedure would be quite natural on Josephus's part if his recall were dated in 58 or 59, so that four or five years fell under Nero. And there is no need at all to suppose that all the incidents which the historian masses under his account of Felix were successive: events in Emesa, Chalcis, Cæsarea, and Jerusalem may easily have been synchronous.

The arguments, then, brought forward in favour of A.D. 60 or 61 do not do more than bring the rule of Felix down to 58 or 59.

*Arguments for an Early Date, A.D. 55 or 56.*—(α) Eusebius's *Chronicle* places the arrival of Festus in Nero 2, October 55-56, and Eusebius's chronology of the procurators goes back probably through Julius Africanus (himself a Palestinian) to contemporary authorities like the *Jewish kings* of Justus of Tiberias. But (i.) Nero 2 is really September 56-September 57; (ii.) it is doubtful whether Eusebius had any authority to depend on here other than Josephus, who gives no precise year for Festus—Julius Africanus is hardly probable, since we know that his chronicle

was very jejune for the Christian period—and if so, Eusebius had to find a year as best he could.[1]

(3) Felix, on his return to Rome, was prosecuted by the Jews for misgovernment, but was acquitted through the influence of his brother Pallas. Pallas had been minister and favourite of Claudius, but was removed from office in the winter following Nero's accession, 54-55. Felix must therefore have been tried at the very beginning of Nero's reign. But this argument would make Felix's recall—if Festus came in summer, as Acts xxv. 1, xxvii. 1, 9, seem to prove—fall actually under Claudius. And, in fact, it would be a mistake to look upon Pallas's retirement as a disgrace. He stipulated that no inquiry should be made into his conduct in office, and was left for another seven years unmolested in the enjoyment of the fortune he had amassed. There is, therefore, every likelihood that he retained for some years enough influence to shield his brother.

Of these arguments, then, the first, so far as it is valid, is an argument for the summer, not of A.D. 55 or 56, but of A.D. 57 as that of the recall, while the second will apply to any of the earlier years of Nero's reign.

In the result, then, the arguments brought forward in favour of each extreme fail to prove their case, but at the same time prove something against the opposite view. Thus the point that Josephus catalogues the events of Felix's procuratorship under Nero cannot be pressed to bring down Felix's tenure as far as 60 or 61, but it does seem to exclude as early a termination as 56, or even 57. Conversely, the influence of Pallas at court need not be terminated by his ceasing to be minister early in 55; but it would have been overshadowed not later than the year 60 by the influence of Poppæa, who in the summer of that year[2] enabled the Jews to win their cause in the matter of the Temple wall, and would certainly have supported them against Felix. Thus the choice again appears to lie between the years 58 and 59 for the recall of Felix and arrival of Festus.

Identical results follow from another line of argument which, though somewhat precarious, was unduly neglected before Ramsay recalled attention to it, namely, the data of St Paul's stay at Philippi and Troas in Acts xx. 6, 7. Being anxious to arrive at Jerusalem for Pentecost, the apostle left Philippi, it may be presumed, on the first day after the days of unleavened bread, took four days, according to our method of reckoning, on the voyage to Troas, and stayed there six days, leaving on a Monday. He arrived, therefore, at Troas on a Tuesday, and left Philippi on the preceding Friday, Nisan 22. Nisan 14, therefore, fell on Thursday This would be possible in A.D. 56 (Thursday, 18th March) or A.D. 57 (Thursday, 7th April), but hardly in either A.D. 55 or 58. As this journey of St Paul immediately preceded his arrest, and his imprisonment under Felix lasted two years, 58 and 59 again appear as the possible alternatives for Felix's recall.

If St Paul was arrested in 56 or 57, and appealed to Cæsar on the arrival of Festus in 58 or 59, then, as he reached Rome in the early part of the year following, and remained there a prisoner for two full years, we are brought down to the early spring of either 61 or 62 for the close of the period recorded in the Acts. That after these two years he was released and visited Spain in the west, and in the east Ephesus, Macedonia, Crete, Troas, Miletus, and perhaps Achaia and Epirus, is probable, in the one case, from the evidence of Romans xv. 28, Clem. *ad Cor.* v., and the Muratorian canon, and, in the other, from the Pastoral Epistles. These journeys certainly cannot have occupied less than two years, and it is more natural to allow three for them, which takes us down to 64-65.

Early evidence is unanimous in pointing to St Peter and St Paul as victims of the persecution of Nero (Clem. *ad Cor.* v. vi., Dionysius of Corinth *ap.* Eus. *H. E.* ii. 25, &c., combined with what we know from Tacitus of the course of the persecution, and from Gaius of Rome, *ap.* Eus. ii. 25, of the burial-places of the two apostles); and tradition clearly distinguished the fierce outbreak at Rome that followed on the fire of the city in July 64 from any permanent disabilities of the Christians in the eye of the law which the persecution may have initiated. There is therefore no reason at all to doubt that both apostles were martyred in 64-65, and the date serves as a confirmation of the chronology adopted above of the imprisonment, release, and subsequent journeys of St Paul.

Investigation, then, of that part of the book of Acts which follows the death of Agrippa, recorded in chap. xii.—*i.e.*, of that part of the apostolic age which follows the year 44—has shown that apparent difficulties can be to a large extent set aside, and that there is nowhere room between A.D. 44 and 64 for doubt extending to more than a single year. The first missionary journey may have begun in 47 or 48; the arrival of Festus may have taken place in the summer of 58 or of 59; the two years of the Roman imprisonment recorded in the last chapter of Acts may have ended in the spring of 61 or 62; and the dates which fall in between these extremes are liable to the same variation. The present writer leans to the earlier alternative in each case, 47, 58, 61, but he willingly concedes that the evidence, as he understands it, is not inconsistent with the later alternative.

But if the events of A.D. 44-64 can thus be fixed with a fair approximation to certainty, it is unfortunately otherwise with the events of A.D. 29-44. Here we are dependent (i.) on general indications given in the Acts; (ii.) on the evidence of the Epistle to the Galatians, which, though in appearance more precise, can be and is interpreted in very different ways.

(i.) The book of Acts is divided, by general summaries from time to time inserted in the narrative, into six periods: i. 1-vi. 7; vi. 8-ix. 31; ix. 32-xii. 24; xii. 25-xvi. 5; xvi. 6-xix. 20; xix. 21-xxviii. 31. Of these the three last extend respectively from the death of Herod to the start for Europe in the second missionary journey (A.D. 44 to the spring of 50 [51]), from the start for Europe to the end of the long stay at Ephesus (A.D. 50 [51] to the spring of A.D. 55 [56]), and from the departure from Ephesus to the end of the two years' captivity at Rome (A.D. 55 [56] to the beginning of A.D. 61 [62]). It will be seen that these periods are of more or less the same length, namely, six (or seven) years, five years, six years. There is therefore some slight presumption that the three earlier periods, which together cover about fifteen years, were intended by so artistic a writer as St Luke to mark each some similar lapse of time. If that were so, the preaching of the apostles at Jerusalem and organization of the Church at the capital—the preaching of the seven and the extension of the Church all over Palestine—the extension of the Church to Antioch, and the commencement of St Paul's work—might each occupy five years more or less, that is to say, roughly, A.D. 29-34, 34-39, 39-44. The conversion of St Paul, which falls within the second period, would on this arrangement fall somewhere between five and ten years after the Crucifixion. Such conclusions are, however, of course general in the extreme.

(ii.) A nearer attempt to date at least the chronology of

[1] Dr C. Erbes (*Texte und Untersuchungen*, new series, iv. 1) attempts to interpret the evidence of Eusebius in favour of the *later* date for Festus as follows: Eusebius's date for Festus is to be found in Nero 1, by striking a mean between the Armenian, Claudius 12, and the Latin, Nero 2; it is really to be understood as reckoned, not by years of Nero, but by years of Agrippa; and as Eusebius erroneously antedated Agrippa's reign by five years, commencing it with A.D. 45 instead of A.D. 50, his date for Festus is five years too early also, and should be moved to Nero 6, A.D. 59-60. The whole of this theory appears to the present writer to be a gigantic mare's nest: see *Journal of Theological Studies*, October 1901, pp. 120-23.

[2] This date appears to be satisfactorily established by Ramsay, "A Second Fixed Point in the Pauline Chronology," *Expositor*, August 1900.

St Paul's earlier years as a Christian could be made by the help of the Galatian Epistle, if we could be sure from what point and to what point its reckonings are made. The apostle tells us that on his conversion he retired from Damascus into Arabia, and thence returned to Damascus; then after three years (from his conversion) he went up to Jerusalem, but stayed only a fortnight, and went to the regions of Syria and Cilicia. Then after fourteen years (from his conversion? or from his last visit?) he went up to Jerusalem again to confer with the elder apostles. Now, if either of these visits to Jerusalem could be identified with any of the visits whose dates have been approximately settled in the chronology of A.D. 44-64, we should have a fixed point from which to argue back. Unfortunately, even less agreement exists on this head than on the question whether the fourteen years of the last-mentioned visit are to be reckoned from the conversion or from the previous visit. Most critics, indeed, are now agreed that the fourteen years are to be calculated from the conversion; and most of them still hold that the visit of Galatians ii. is the same as the council of Acts xv., partly, no doubt, on the ground that the latter visit was too important and decisive for St Paul to have omitted in giving even the most summary description of his relations with the twelve. This ground would, however, be cut away from their feet if it were possible to hold (with J. V. Bartlet, *Apostolic Age*, 1900, and V. Weber, *Die Abfassung des Galaterbriefs vor dem Apostelkonzil*, Ravensburg, 1900) that the epistle was actually written just before the council, *i.e.*, in the winter of 48-49 [49-50]. In that case, of course, the two visits of Galatians i. and ii. would be those of Acts ix. 26 and xi. 30. The fourteen years reckoned back from the latter (*c.* A.D. 46) would bring us to A.D. 32-33 as the latest possible date for the conversion. With the older view, on the other hand, the fourteen years reckoned from the council in A.D. 49 [50] would allow us to bring down the conversion to A.D. 36. The new view clears away some manifest difficulties in the reconciliation of the Epistle and the Acts, and the early date for Galatians in relation to the other Pauline Epistles is not so improbable as it may seem; but the chronology still appears more satisfactory on the older view, which enables the conversion to be placed at least three years later than on the alternative theory. But it is clear that the last word has not been said, and that definite results for this period cannot yet be looked for.

To sum up: an attempt has been made, it is hoped with some success, to provide a framework of history equipped with dates from the time of St Peter's arrest by Herod Agrippa I. at the Passover of A.D. 44 down to the martyrdom of St Peter and St Paul in the persecution of Nero, A.D. 64-65. For the previous period, on the other hand, from A.D. 29 to A.D. 44, it appeared impossible in our present state of knowledge to state conclusions other than in the most general form.

AUTHORITIES.—The views stated in this article are in general (though with some modifications) the same as those which the present writer worked out with more fulness of detail in HASTINGS'S *Dictionary of the Bible*, i. (1898) 403-424. Of older books should be mentioned:—IDELER. *Handbuch der mathematischen und technischen Chronologie*, 2 vols. (1825).—WIESELER. *Chronologie des apostolischen Zeitalters* (1848).—LEWIN'S *Fasti Sacri* (1865).—The most important modern contributions are to be found in Prof. W. M. RAMSAY'S various works, and in HARNACK'S *Chronologie der altchristlichen Litteratur bis Eusebius*, i. 233-244. (C. H. T.)

**Chrudim,** a town in Bohemia, Austria. It has an important horse market, besides manufactures of sugar, spirits, beer, soda-water, and agricultural machinery. There are also steam corn-mills and saw-mills. Chrudim is the birthplace of Joseph Ressel (1793-1857), who is honoured in Austria as the inventor of the screw propeller. Population, 13,017.

**Chubut,** a territory of the Argentine Republic, Patagonia, bounded on the N. by Rio Negro, on the S. by Santa Cruz, on the E. by the Atlantic, and on the W. by Chile. Its official area at the census of 1895 was 93,427 square miles; and in 1895 its population was 3748, as compared with 153 in 1869. The capital, Rawson, is situated 3 miles from the mouth of the Chubut. The territory is divided into three departments. In 1895 there were 29,944 head of cattle, 47,306 sheep, 12,907 horses, 310 farms, and 12,355 acres planted in cereals.

**Chulalongkorn, Phra Paramindr Maha** (1853-——), king of Siam, eldest son of King Maha Mongkut, was born 21st September 1853. His full signature, used in all important state documents, consists of twenty-seven names, but it is by the first four that he is usually known. Educated in his childhood by English teachers, especially by Captain John Bush, he acquired a good knowledge of the English language and a due appreciation of Western culture. But his surroundings were purely Oriental, and as his boyhood was spent, according to custom, in a Buddhist monastery, he remained in sympathy with his people. He succeeded to the throne on the death of his father, 1st October 1868, and was crowned on 11th November following, when Europeans were present for the first time at such a ceremony. Until his majority in 1873 the government was carried on by a regent, the young king retiring to a Buddhist monastery, and then making a long tour through India and the Dutch East Indies, an event hitherto unheard of among the potentates of Eastern Asia. But he had no sooner taken the reins of power than he gave evidence of his recognition of the importance of modern culture by abolishing slavery, which existed in Siam in its most extended form. He also did away with the custom of approaching the king on all fours. Still more important, in view of the numerous races and creeds included among his subjects, was the proclamation of liberty of conscience. This was followed by the erection of schools and hospitals, the construction of roads and railways, and the further development of the army and fleet which his father had commenced. To him Siam is indebted for its standard coinage, its postal and telegraph service, and for the police, sanitation, and electric-lighting of Bangkok. Two of the king's sons were sent to school in England, and in the summer of 1897 King Chulalongkorn paid a visit to Europe, arriving at Portsmouth in his yacht on the 29th July. On the 4th August he was received by Queen Victoria at Osborne. After a tour in Great Britain he proceeded to Berlin, Brussels, and The Hague, and arrived in Paris on 11th September, and after spending some weeks in the French capital, returned to Siam late in the year.

**Chumla.** See SHUMLA.

**Chungking,** a city in the province of Szechuen, China, on the left bank of the Yangtse, at its point of junction with the Kialing, in 29° 33′ N. lat. and 107° 2′ E. long. It is the commercial centre for the trade, not only of Szechuen, but of all south-western China. The one highway between Szechuen and the eastern provinces is the Yangtse river route, as owing to the mountainous nature of the intervening country land transit is almost impracticable. The import trade brought up by large junks from Ichang, and consisting of cotton cloth, yarn, metals, and foreign manufactures, centres here, and is distributed by a class of smaller vessels up the various rivers of the provinces. Native produce, such as

yellow silk, white wax, hides, rhubarb, musk, and opium, is here collected and repacked for conveyance to Hankow, Shanghai, or other parts of the empire. The city was opened to foreign trade by convention with the British Government in 1891, with the proviso, however, that foreign steamers should not be at liberty to trade there until Chinese-owned steamers had succeeded in ascending the river. This restriction was abolished by the Japanese treaty of 1895, which declared Chungking open on the same terms as other ports. Since that date the problem of steam navigation on the section of the river between Ichang and Chungking has been occupying the attention of practical men. A small steamer has been navigated up the rapids, but it is a question how far steam navigation can be made a practical success. At present the trade is carried by native craft, which are hauled up against the strength of the current in the worst places by a line of trackers on the bank. Another difficulty is the great rise in the river during the summer months. At Chungking this rise is ordinarily 70 feet, and occasionally it is as much as 96 feet. The population of Chungking, including the city of Kiangpeh on the opposite bank of the Kialing river, is about 300,000. The foreign residents are very few. In 1898 the value of the trade passing through the maritime customs was H. taels 17,426,000 (£2,614,000), and in 1899 H. taels 25,792,000 (£3,868,000), of which imports, chiefly Manchester goods, counted for £1,961,000.

**Chuquisaca,** a department of Bolivia, bounded on the N. by the departments of Cochabamba and Santa Cruz, on the S. by that of Tarija, on the E. by the Rio Paraguay, and on the W. by the department of Potosi. It has an area of 39,850 square miles, and had a population in 1893 of 286,710. Its capital is Sucre (26,000). The department is divided into four provinces, Yamparaez, Cinti, Tomina, and Azero, and has 29 schools with about 2000 pupils.

**Church, Richard William** (1815-1890), Dean of St Paul's, was the son of John Dearman Church, an Irish merchant of Quaker ancestry. He was born at Lisbon, 25th April 1815, his early years being mostly spent at Florence. After his father's death in 1828 he was sent to a school of a pronounced evangelical type at Redlands, Bristol, and went in 1833 to Wadham College, Oxford, an evangelical college. He took first-class honours in 1836, much to his own surprise, and in 1838 was elected fellow of Oriel. One of his contemporaries, Richard Michell, commenting on this election, said: "There is such a moral beauty about Church that they could not help taking him." He was appointed tutor of Oriel in 1839, and was ordained the same year. He was an intimate friend of Newman's at this period, and closely allied to the Tractarian party. In 1841 No. 90 of *Tracts for the Times* appeared, and Church resigned his tutorship. In 1844-1845 he was junior proctor, and in that capacity, in concert with his senior colleague, vetoed a proposal to censure Tract 90 publicly. In 1846 Church, with others, started the *Guardian* newspaper. In 1850 he became engaged to Miss H. F. Bennett, of a Somersetshire family, a niece of Bishop Moberly. After again holding the tutorship of Oriel, he accepted in 1852 the small living of Whatley in Somersetshire, near Frome, and was married in the following year. He was a diligent parish priest and a serious student, and contributed largely to current literature. In 1869 he refused a canonry at Worcester, but in 1871 he accepted, most reluctantly (calling it "a sacrifice *en pure perte*"), the deanery of St Paul's, to which he was nominated by Mr Gladstone. His task as dean was a complicated one. It was (1) the restoration of the cathedral, (2) the adjustment of the question of the cathedral revenues with the Ecclesiastical Commissioners, (3) the reorganization of a conservative cathedral staff with anomalous vested rights. He described the intention of his appointment to be "that St Paul's should waken up from its long slumber." The first year that he spent at St Paul's was, writes one of his friends, one of "misery" for a man who loved study and quiet and the country, and hated official pomp and financial business and ceremonious appearances. But he performed his difficult and uncongenial task with almost incredible success, and is said never to have made an enemy or a mistake. The dean was distinguished for uniting in a singular degree the virtues of austerity and sympathy. He was pre-eminently endowed with the faculty of judgment, characterized by Canon Scott Holland as the faculty of "high and fine and sane and robust decision." Though of unimpressive stature, he had a strong magnetic influence over all brought into contact with him, and though of a naturally gentle temperament, he never hesitated to express censure if he was convinced it was deserved. In the pulpit the voice of the dean was deliberately monotonous, and he employed no adventitious gesture. He may be described as a High Churchman, but of an essentially rational type, and with an enthusiasm for religious liberty that made it impossible for him to sympathize with any unbalanced or inconsiderate demands for deference to authority. He said of the Church of England that there was "no more glorious church in Christendom than this inconsistent English Church." The dean often meditated resigning his office, though his reputation as an ecclesiastical statesman stood so high that he was regarded in 1882 as a possible successor to Archbishop Tait. But his health and mode of life made it out of the question. In 1888 his only son died; his own health declined, and he appeared for the last time in public at the funeral of Canon Liddon in 1890, dying on 9th December 1890, at Dover. He was buried at Whatley. The dean's chief published works are a *Life of St Anselm* (1870), the lives of *Spenser* (1879) and *Bacon* (1884) in Macmillan's "Men of Letters" series, an *Essay on Dante* (1878), *The Oxford Movement* (1891), together with many other volumes of essays and sermons. In these writings he exhibits a great grasp of principles, an accurate mastery of detail, and the same fusion of intelligent sympathy and dispassionate judgment that appeared in his handling of business. His style is lucid, and has the charm of austerity. He stated that he had never studied style *per se*, but that he had acquired it by the exercise of translation from classical languages; that he watched against the temptation of using unreal and fine words; that he employed care in his choice of verbs rather than in his use of adjectives, and that he fought against self-indulgence in writing just as he did in daily life. His sermons have the same quality of self-restraint. His private letters are fresh and simple, and contain many unaffected epigrams; in writing of religious subjects he resolutely avoided dogmatism without ever sacrificing precision. The dean was a man of genius, whose moral stainlessness and instinctive fire were indicated rather than revealed by his writings. (A. C. Bᴇ.)

**Church Army.**—The Church Army is an English religious organization, which was founded in 1882 by the Rev. Wilson Carlile, who banded together in an orderly army of "soldiers" and "officers" a few working men and women, whom he and others trained to act as "Church of England evangelists" among the outcasts and criminals of the Westminster slums. Previous experience had convinced him that wickedness and irreligion among the lowest classes of the people could best be overcome by new and aggressive action on the part

of the Church, and that this work was most effectively done by zealous laymen and women of the same class as those whom it was desired to touch. "Evangelistic zeal with Church order" is the principle of the Church Army, and it is essentially a working men's and women's mission to working people. As the work grew, a training institution for evangelists was started in Oxford, but soon moved (1886) to 130 Edgware Road, London, W., where the headquarters of the Army are established. Working men are trained as evangelists, and working women as mission nurses, and are supplied to the clergy whenever asked for. The men evangelists have to pass an examination by the archdeacon of Middlesex, and are then (since 1896) admitted by the bishop of London as "lay evangelists in the Church"; the mission nurses must likewise pass an examination by the diocesan inspector of schools. All Church Army workers (of whom there are over 1200 of one kind and another) are entirely under the control of the incumbent of the parish to which they are sent. They never go to a parish unless invited, nor stay when asked to go by the parish priest. Officers and nurses are paid a limited sum for their services by the vicar or by voluntary local contributions. Church Army mission and colportage vans circulate throughout the country parishes, if desired, with itinerant evangelists, who hold simple missions, without charge, and spread wholesome literature. Each van missioner has a clerical "adviser." Missions are also held in prisons and workhouses, at the invitation of the authorities. In 1888 (before the similar work of the Salvation Army was inaugurated) the Church Army established labour homes in London and elsewhere, with the object of giving a "fresh start in life" to the outcast and destitute. The Church Army homes deal with the outcast and destitute in a plain, simple, straightforward way. They demand that the persons should show a desire for amendment; they subject them to firm discipline; they give them hard work; they give them decent clothes; and they strive to win them to a Christian life. The inmates earn their board and lodging by piece-work, for which they are paid at the current trade rates, while by a gradually lessening scale of work and pay they are stimulated to obtain situations for themselves and given time to seek for them. There are about 103 homes in London and the provinces, and 56 per cent. of the 26,000 cases helped in 1900 made the successful beginning of an honest, self-supporting life. Selected and tested cases are enabled to emigrate. The Church Army has lodging homes, an employment bureau, cheap food depot, old clothes department, dispensary, and other social works, and an inebriates' reformatory under the Act of 1898. The whole of the work is done in loyal subordination to the diocesan and parochial organization of the Church of England. (M. B. S.)

**Churchill,** MISSINNIPPI, or ENGLISH, a river of Athabasca and Keewatin districts, Canada. It rises in La Loche—a small lake in 56° 30′ N. lat. and 109° 30′ W. long., at an altitude of 1577 feet above the sea—and flows in a north-easterly direction to Hudson Bay, passing through a number of lake expansions. Its principal tributaries are the Beaver—350 miles long, Sandy, Montreal, Reindeer, and Little Churchill rivers. Between Frog and Methy portages—480 miles—it formed part of the old *voyageur* route to the Peace, Athabasca, and Mackenzie. Its largest affluent, Reindeer river, discharges the waters of Reindeer lake (with an area of 2490 square miles and 1150 feet above the sea) and Wollaston lake (altitude, 1300 feet). The Churchill is 925 miles long. Port Churchill, at its mouth, is the best harbour in the southern portion of Hudson Bay.

**Churchill, Lord Randolph Henry Spencer** (1849–1895), English statesman, third son of John, seventh duke of Marlborough, by Frances, daughter of the third marquis of Londonderry, was born at Blenheim Palace, on 13th February 1849. His early education was conducted at home, and at Mr Tabor's preparatory school at Cheam. In January 1863 he went to Eton, where he remained till July 1865. He was not specially distinguished either in school work or games while at Eton; his contemporaries describe him as a vivacious and rather unruly lad. In October 1867 he matriculated at Merton College, Oxford. He was fond of amusement, and had carried to Oxford an early taste for sport which he retained throughout life. But he read with some industry, and obtained a second class in jurisprudence and modern history in 1870. In 1874 he was elected to Parliament in the Conservative interest for Woodstock, defeating Mr George Brodrick, a fellow, and afterwards Warden, of Merton College. His maiden speech, delivered in his first session, made no impression on the House, nor did he become in any way conspicuous till 1878. In that year he forced himself into public notice as the exponent of a species of independent Conservatism. He directed a series of furious attacks against some of the occupants of the front ministerial bench, and especially that "old gang" who were distinguished rather for the respectability of their private characters, and the unblemished purity of their Toryism, than for striking talent. Mr Sclater Booth, president of the Local Government Board, was the especial object of his ire, and that minister's County Government Bill was fiercely denounced as the "crowning dishonour to Tory principles," and the "supreme violation of political honesty." The audacity of Lord Randolph's attitude, and the vituperative fluency of his invective, made him a parliamentary figure of some importance before the dissolution of the 1874 Parliament, though he was not as yet taken quite seriously. In the new Parliament of 1880 he speedily began to play a more notable rôle. With the assistance of his devoted adherents, Sir Henry Drummond Wolff, Mr John Gorst, and occasionally of Mr Arthur Balfour, and one or two others, he constituted himself at once the audacious opponent of the Liberal administration and the unsparing critic of the Conservative front bench. The "fourth party," as it was nicknamed, was effective at first not so much in damaging the Government as in awakening the Opposition from the apathy which had fallen upon it after its defeat at the polls. Churchill roused the Conservatives and gave them a fighting issue, by putting himself at the head of the resistance to Mr Bradlaugh, the member for Northampton, who, though an avowed atheist or agnostic, was prepared to take the parliamentary oath. Sir Stafford Northcote, the Conservative leader in the Lower House, was forced to take a strong line on this difficult question by the energy of the fourth party, who in this case clearly expressed the views of the bulk of the Opposition. The long and acrimonious controversy over Mr Bradlaugh's seat, if it added little to the reputation of the English legislature, at least showed that Lord Randolph Churchill was a parliamentary champion who added to his audacity much tactical skill and shrewdness. He continued to play a conspicuous part throughout the Parliament of 1880–85, dealing his blows with almost equal vigour at Mr Gladstone and at the Conservative front bench, some of whose members, and particularly Sir Richard Cross and Mr W. H. Smith, he assailed with extreme virulence. From the beginning of the Egyptian imbroglio Lord Randolph was emphatically opposed to almost every step taken by the Government. He declared that the suppression of Arabi Pasha's rebellion

was an error, and the restoration of the Khedive's authority a crime. He called Mr Gladstone the "Moloch of Midlothian," for whom torrents of blood had been shed in Africa. He was equally severe on the domestic policy of the administration, and was particularly bitter in his criticism of the Kilmainham Treaty and the *rapprochement* between the Gladstonians and the Parnellites. It is true that for some time before the fall of the Liberals in 1885, he had considerably modified his attitude towards the Irish question, and was himself cultivating friendly relations with the Home Rule members, and even obtained from them the assistance of the Irish vote in the English constituencies in the general election. By this time he had definitely formulated the policy of progressive Conservatism which was known as "Tory democracy." He declared that the Conservatives ought to adopt, rather

LORD RANDOLPH CHURCHILL.
(*From a photograph by Elliot & Fry, London.*)

than oppose, reforms of a popular character, and to challenge the claims of the Liberals to pose as the champions of the masses. His views were to a large extent accepted by the official Conservative leaders in the treatment of the Gladstonian Franchise Bill of 1884. Lord Randolph insisted that the principle of the Bill should be accepted by the Opposition, and that resistance should be focussed upon the refusal of the Government to combine with it a scheme of redistribution. The prominent, and on the whole judicious and successful, part he played in the debates on these questions, still further increased his influence with the rank and file of the Conservatives in the constituencies. At the same time he was actively spreading the gospel of democratic Toryism in a series of platform campaigns. In 1883 and 1884 he invaded the Radical stronghold of Birmingham itself, and in the latter year took part in a Conservative garden party at Aston Manor, at which his opponents paid him the compliment of raising a serious riot. He gave constant attention to the party organization, which had fallen into considerable disorder after 1880, and was an active promoter of the Primrose League, which owed its origin to the happy inspiration of one of his own "fourth party" colleagues. In 1884 the struggle between stationary and progressive Toryism came to a head, and terminated in favour of the latter. At the conference of the Central Union of Conservative Associations, Lord Randolph was nominated chairman, notwithstanding the strenuous opposition of the parliamentary leaders of the party. The split was averted by Lord Randolph's voluntary resignation; but the episode had confirmed his title to a leading place in the Tory ranks. It was further strengthened by the prominent part he played in the events immediately preceding the fall of the Liberal Government in 1885; and when Mr Childers's budget resolutions were defeated by the Conservatives, aided by about half the Parnellites, Lord Randolph Churchill's admirers were justified in proclaiming him to have been the "organizer of victory." His services were, at any rate, far too important to be refused recognition; and in Lord Salisbury's Cabinet of 1885 he was appointed to no less an office than that of secretary of state for India. During the few months of his tenure of this great post the young free-lance of Tory democracy surprised the permanent officials and his own friends by the assiduity with which he attended to his departmental duties and the rapidity with which he mastered the complicated questions of Indian administration. In the autumn election of 1885 he contested Central Birmingham against Mr Bright, and though defeated here, was at the same time returned by a very large majority for South Paddington. In the contest which arose over Mr Gladstone's Home Rule scheme, both in and out of Parliament, Lord Randolph again bore a conspicuous part, and in the electioneering campaign his activity was only second to that of some of the Liberal Unionists, the marquis of Hartington, Mr Goschen, and Mr Chamberlain. He was now the recognized Conservative champion in the Lower Chamber, and when the second Salisbury administration was formed after the general election of 1886 he became chancellor of the exchequer and leader of the House of Commons. His management of the House was on the whole successful, and was marked by tact, discretion, and temper. But he had never really reconciled himself with some of his colleagues, and there was a good deal of friction in his relations with them, which ended with his sudden resignation on 20th December 1886. Various motives influenced him in taking this surprising step; but the only ostensible cause was that put forward in his letter to Lord Salisbury, which was read in the House of Commons on 27th January. In this document he stated that his resignation was due to his inability, as chancellor of the exchequer, to concur in the demands made on the treasury by the ministers at the head of the naval and military establishments. It was commonly supposed that he expected his resignation to be followed by the unconditional surrender of the Cabinet, and his restoration to office on his own terms. The sequel, however, was entirely different. The Cabinet was reconstructed with Mr Goschen as chancellor of the exchequer, and Lord Randolph's own career as a Conservative chief was practically closed. He continued, for some years longer, to take a considerable share in the proceedings of Parliament, giving a general, though decidedly independent, support to the Unionist administration. On the Irish question he was a very candid critic of Mr Balfour's measures, and one of his later speeches, which recalled the acrimonious violence of his earlier period, was that which he delivered in 1890 on the report of the Parnell Commission. He also fulfilled the promise made on his resignation by occasionally advocating the principles of economy and retrenchment in the debates on the naval and military estimates.

In April 1889, on the death of Mr Bright, he was asked to come forward as a candidate for the vacant seat in Birmingham, and the result was a rather angry controversy with Mr Chamberlain, terminating in the so-called "Birmingham compact" for the division of representation of the Midland capital between Liberal Unionists and Conservatives. But his health was already precarious, and this, combined with the anomaly of his position, induced him to relax his devotion to Parliament during the later years of the Salisbury administration. He bestowed much attention on society, travel, and sport. He was an ardent supporter of the turf, and in 1889 he won the Oaks with a mare named the Abbesse de Jouarre. In 1891 he went to South Africa, in search both of health and relaxation. He travelled for some months through Cape Colony, the Transvaal, and Rhodesia, making notes on the politics and economics of the countries, shooting lions, and recording his impressions in letters to a London newspaper, which were afterwards republished under the title of *Men, Mines, and Animals in South Africa*. He returned with renewed energy, and in the general election of 1892 once more flung himself, with his old vigour, into the strife of parties. His seat at South Paddington was uncontested; but he was active on the platform, and when Parliament met he returned to the Opposition front bench, and again took a leading part in debate, attacking Mr Gladstone's second Home Rule Bill with especial energy. But it was soon apparent that his powers were undermined by the inroads of disease. As the session of 1893 wore on his speeches lost their old effectiveness, and in 1894 he was listened to not so much with interest as with pity. His last speech in the House was delivered in the debate on Uganda in June 1894, and was a painful failure. He was, in fact, dying of general paralysis. A journey round the world was undertaken as a forlorn hope. Lord Randolph started in the autumn of 1894, accompanied by his wife, but the malady made so much progress that he was brought back in haste from Cairo. He reached England shortly before Christmas, and died at 50 Grosvenor Square on 24th January 1895.

Lord Randolph Churchill married, in January 1874, Jennie, daughter of Mr Leonard Jerome of New York, U.S.A., who survived him. He left two sons, Winston and John, the former of whom, after serving for some time in the 4th Hussars and acting as a special correspondent in the South African war, was elected member of Parliament for Oldham in October 1900.

The earlier speeches of Lord Randolph Churchill have been edited, with an introduction and notes, by Louis Jennings; two vols., London, 1889. See also T. H. S. Escott, *Randolph Spencer Churchill*, 1895; and H. W. Lucy, *Diary of Two Parliaments*, 1892. (S. J. L.)

**Chust,** a town of Russian Turkestan, province of Fergana, district of Namangan, 110 miles north-east of Kokan, on Narym river. Population, 13,686.

**Cialdini, Enrico** (1811–1892), Italian soldier and politician, was born at Castelvetro, in Modena, Italy, 10th August 1811. In 1831 he took part in the insurrection at Modena, fleeing afterwards to Paris, whence he proceeded to Spain to fight against the Carlists. Returning to Italy in 1848, he commanded a regiment at the battle of Novara. In 1859 he organized the Alpine Brigade, fought at Palestro at the head of the 4th Division, and in the following year invaded the Marches, won the battle of Castelfidardo, took Ancona, and subsequently directed the siege of Gaeta. For these services he was created duke of Gaeta by the king, and was assigned a pension of 10,000 lire by Parliament. In 1861 his intervention envenomed the Cavour-Garibaldi disputé, royal mediation alone preventing a duel between him and Garibaldi. Placed in command of the troops sent to oppose the Garibaldian expedition of 1862, he defeated Garibaldi at Aspromonte. Between 1862 and 1866 he held the position of Lieutenant-Royal at Naples, and in 1864 was created Senator. On the outbreak of the war of 1866 he resumed command of an army corps, but dissensions between him and Lamarmora prejudiced the issue of the campaign and contributed to the defeat of Custoza. After the war he refused the command of the General Staff, which he wished to render independent of the War Office. In 1867 he attempted unsuccessfully to form a Cabinet sufficiently strong to prevent the threatened Garibaldian incursion into the Papal States, and two years later failed in a similar attempt, through disagreement with Lanza concerning the army estimates. On 3rd August 1870 he pleaded in favour of Italian intervention in aid of France, a circumstance which enhanced his influence when in July 1876 he replaced Nigra as ambassador to the French Republic. This position he held until 1882, when he resigned on account of the publication by Mancini of a despatch in which he had complained of arrogant treatment by M. Waddington. He died at Leghorn, 8th September 1892. (H. W. S.)

**Cider.**—The recent development of the cider-making industry, coupled with certain changes in the mode of manufacture, render it necessary to supplement the two articles on Cider and Perry in the ninth edition of the *Encyclopædia Britannica* with additional information.

Cider and perry are liquors containing from as little as 2 per cent. of alcohol to 7 or 8 per cent., seldom more, and rarely as much, produced by the vinous fermentation of the expressed juice of apples and pears; but cider and perry of prime quality can only be obtained from vintage fruit, that is, apples and pears grown for the purpose and unsuited for the most part for table use. A few table apples make good cider, but the best perry is only to be procured from pears too harsh and astringent for consumption in any other form. The making of perry is in England confined, in the main, to the counties of Hereford, Worcester, and Gloucester. These three counties, together with Somerset and Devon, constitute, too, the principal cider-making district of the country; but the industry, which was once more widely spread, still survives in Norfolk, and has lately been revived in Kent, though, in both these counties, much of the fruit used in cider-making is imported from the west country and some from the Continent. Speaking generally, the cider of Herefordshire is distinguished for its lightness and briskness, that of Somerset for its strength, and that of Devonshire for its lusciousness.

Inasmuch as English orchards are crowded with innumerable varieties of cider apples, many of them worthless, a committee composed of members of the Herefordshire Fruit-Growers' Association and of the Fruit and Chrysanthemum Society was appointed in 1899 to make a selection of vintage apples and pears best suited to Herefordshire and the districts adjoining. The following is the list drawn up by the committee:—

*Apples.*—Old Foxwhelp, Cherry Pearmain, Cowarne Red, Dymock Red, Eggleton Styre, Kingston Black or Black Taunton, Skyrme's Kernel, Spreading Redstreak, Carrion apple, Cherry Norman, Cummy Norman, Royal Wilding, Handsome Norman, Strawberry Norman, White Bache or Norman, Broad-leaved Norman, Argile Grise, Bramtôt, De Boutville, Fréquin Audièvre, Medaille d'Or, the last five being French sorts introduced from Normandy about twenty years ago, and now established in the orchards of Herefordshire.

*Pears.*—Taynton Squash, Barland, Oldfield, Moorcroft or Malvern Hill, Red-pear, Thurston's Red, Longland, Pine pear.

No equally authoritative selection has been made for the Somerset and Devon districts, but the following varieties of cider apples are held in good repute in those parts:—Kingston Black, Jersey Chisel, Hangdowns, Fair Maid of Devon, Woodbine, Duck's Bill, Slack-my-Girdle, Bottle Stopper, Golden Ball, Sugar-loaf, Red Cluster, Royal Somerset, and Cadbury (believed to be identical with the Royal Wilding of Herefordshire). As a rule the best cider apples are of small size. "Petites pommes, gros cidre," say the French.

Cider and perry not being taxable liquors in England, it is impossible to estimate with even an approach to accuracy the amount of the annual production of them. In 1896 Mr Sampson, the then secretary of the National Association of English Cider-makers, in his evidence before the Royal Commission on Agriculture, put it at 55½ million gallons. Since that date the increased demand for these native wines has given such an impetus to the industry that this figure might with safety be doubled. In France official statistics are available, and these show not only that that country is the largest producer of cider (including perry) in the world, but that the output is yearly increasing. In the ten years ending 1888 the annual average production amounted to 14 million hectolitres. This average was, however, largely exceeded in 1899 and 1900, the production in 1899 reaching 21 million, and in 1900 nearly 30 million hectolitres, or within 5 million hectolitres of the output of wine in the last-mentioned year. Although some cider is made in sixty-five departments, by far the largest amount comes from the provinces of Normandy and Brittany. In Germany cider-making is a considerable and growing industry. Manufactories on a small scale exist in North Germany, as at Guben and Grünberg, but the centre of the industry is at Frankfort-on-Main, Sachsenhausen, and the neighbourhood, where there are five large and twenty-five small factories employing upwards of 1000 hands. Of late years the production of cider in Wurtemberg has greatly increased, and large quantities of fruit are imported from foreign countries, especially from Switzerland, where there are numerous orchards of cider apples. Stuttgart is the principal depot for foreign fruit. Out of 2857 truckloads brought in by rail in 1898, 1973 came from Switzerland and 561 from Austria. In Baden, Hesse, Wurtemberg, and the Palatinate the highways have within the last twenty-five years been extensively planted with cider fruit. The trees belong to the respective states, which derive an increasing revenue from the sale of the fruit. Speaking generally, however, the native-grown fruit used in Germany for cider-making consists of inferior and undersized table apples not worth marketing. The cider thus made is of poor quality, but, as it is chiefly used for "bowle"—a kind of cider cup flavoured with "Mai-kraut" (the common woodruff)—the quality is not of consequence. The bottled cider for export is treated much like champagne and is usually fortified and flavoured until, in the words of an acknowledged French authority, M. Truelle, it becomes a hybrid between cider and white wine rather than pure cider.

The practice which formerly prevailed in England of making cider on the farm from the produce of the home orchards has within the last few years been to a large extent given up, and, as in Germany and many parts of France, farmers now sell their fruit to owners of factories where the making of cider and perry is carried on as a business of itself. In these hand or horse power is superseded by steam and sometimes by electricity, as in the factory of E. Seigel in Grünberg, and the old-fashioned appliances of the farm by modern mills and presses capable of turning out large quantities of liquor. The clearing of the juice, too, which used to be effected by running it through bags, is in the factories accomplished more quickly by forcing it through layers of compressed cotton in a machine of German origin known as Lumley's filter. The actual process of cider and perry making is a simple one, and is as described in the ninth edition of this work, but, owing in the main to the investigations of German scientists, it is now possible to trace the causes of those changes, familiar to all practical cider-makers, which occur in both cider and perry during fermentation, and thereby to impart to the manufacture of these liquors a degree of exactitude unattainable hitherto. Cider made from a judicious mixture of several varieties of apples is to be preferred to cider made from one variety only, inasmuch as it is less difficult to find the requisite degrees of richness, astringency, and flavour in several varieties than in one; but the contrary is the case with pears, of which the most noted sorts, such as the Barland, the Taynton Squash, and the Oldfield, produce the best perry when unmixed with other varieties. It is not now considered advisable to crush the seeds or pips in making cider from the best fruit, as their aromatic taste would mask or destroy the delicate flavour of the juice; but where the latter is of poor quality the crushing of the pips is admissible in order to supplement its deficiency in flavour.

Some fining of an albuminous nature is generally requisite in order to clear the juice and facilitate its passage through the filter, but the less used the better. The simplest and cleanest is skim milk whipped to a froth and blended gradually with the cider as it is pumped into the mixing vat. Many nostrums are sold for the clearing of cider, but none are necessary and most are harmful.

Of late years the practice has largely obtained of using preservatives for the purpose of checking fermentation. The principal preservatives employed are salicylic and boracic acid and formalin. The two former are ineffective except in quantities likely to prove hurtful to health, while formalin, in itself a powerful and deleterious drug, though it stops fermentation, renders the liquor cloudy and undrinkable. Other foreign ingredients, such as saccharin and porcherine, both coal-tar derivatives—the latter a recent discovery of a French chemist, after whom it is named—are used by many makers, chiefly for the purpose of rendering bad and therefore unwholesome cider palatable and saleable. Provided that cider and perry be properly filtered and attention paid to perfect cleanliness of vessels and appliances, there is no need of preservatives or sweeteners, and their use ought to be forbidden by law in England, as it is in most continental states in the case of liquors to be consumed within their borders, though not, it is significant to note, in the case of liquors intended for exportation.

Within the last few years the wholesome properties of cider and perry when pure and unadulterated have been recognized by medical men, who recommend them as pleasant and efficacious remedies in affections of a gouty or rheumatic nature, maladies which, strange to say, these very liquors were once supposed to foster, if not actually to originate. Under a similar false impression the notion is general that hard rough cider is apt to cause diarrhœa, colic, and kindred complaints, whereas, as a fact, disorders of this kind are conspicuous by their absence in those parts of the country where rough cider and perry constitute the staple drinks of the working-classes. This is especially the case in Herefordshire, which is said also to be the only county in England whence no instance of the occurrence of Asiatic cholera has ever been reported.

Now that the increasing demand for cider and perry has drawn attention to its importance to agriculturists, the cider-making industry has received a certain amount of assistance and encouragement from public or quasi-public sources. Many agricultural societies, including the Royal and the Bath and West, offer prizes for cider and perry in cask and bottle, and the latter society gives a grant of £100 a year towards the cost of some interesting experiments at Butleigh in Somersetshire. The county councils in the cider-producing districts have included cider-making among the subjects in which they give gratuitous instruction, though as yet these bodies are hampered by the difficulty of procuring competent teachers. The Herefordshire county council has, through the co-operation of certain landowners, obtained the use of six pomological stations in different parts of the county, consisting of small fruit plantations, where demonstrations are given in various branches of fruit culture. In addition to these the council has established a central pomological and experimental garden close to Hereford, where, as one of the principal aims of the council is to promote the cider industry, a branch of agriculture of special importance to Herefordshire, a large number of cider apples and perry pears have been planted. Included among these is a nice collection of approved French sorts obtained from Normandy; and as the varieties introduced thence, as already mentioned, about 1880, have turned out to be valuable additions to the orchards of the county, it is probable that some of these still newer importations will prove to be well suited to English soil and climate.

Fruit-growers who look to cider-making "as a means of utilizing windfalls and small and inferior apples of cooking and dessert varieties not worth sending to market" (to quote from a paper lately read by a fruit-grower before a learned society) should be warned that it is as important to the cider industry that good cider only should be on sale as it is to the fruit-growing industry that good fruit only should be sent to market. Bad cider of English make brings discredit on the beverage and lets in the foreigner, just as inferior fruit does. The juice of the apple is naturally affected by the condition of the fruit itself, and if this be unripe, unsound, or worm-eaten the cider made from it will be inferior to that made from full-grown, ripe, and sound fruit. If such fruit be not good enough to send to market, neither will the cider made from it be good enough to place before the public. Nevertheless, it may furnish a sufficiently palatable drink for home consumption, and may therefore be so utilized. But when, as happens from time to time in fruit-growing districts, there is a glut, and even the best table fruit is not saleable at a profit, then, indeed, cider-making is a means of storing in a liquid form what would otherwise be left to rot on the ground; whilst if a proportion of vintage fruit were mixed therewith, a drink would be produced which would not discredit the cider trade, and would bring a fair return to the maker. (C. W. R. C.)

**Ciechanow,** a district town of Russian Poland, government Plock, on the Prussian frontier, 105 miles north-west of Warsaw. Population, 10,670.

**Cienfuegos,** one of the principal cities of Cuba, near the central portion of the south coast. It lies on a land-locked harbour known as the bay of Jagua, which Columbus visited on his second voyage, and which Father Las Casas described as the most magnificent port in the world. It was settled in 1819 by refugees from Santo Domingo. Since 1880 its trade has increased enormously. A circular railway leads to the wharves and large warehouses, thereby facilitating the loading and unloading of vessels. Many local steamers connect the town with Batabano, Trinidad, Santiago, and the Isle of Pines. The streets are regularly laid out; the houses are well built, and there are beautiful shade trees and plazas, one of which is the largest in Cuba. There is a handsome main avenue, at the end of which are statues. It is lighted by gas and electricity, has abundant water-supply, excellent clubs, and a theatre. It has also an imposing governor's house, military and government hospitals, market-place, and railway station. Some of the largest and finest sugar estates in the world are situated in the vicinity, including the Soledad and others. Probably no place on the island offers greater advantages for seeing sugar-making in its most favourable aspects. Population (1899), 30,038.

**Cieza,** a town of Murcia, Spain, on the railway and high road from Madrid to Cartagena, and on the river Sigura. Population (1897), 11,717. Its environs are very fertile, and produce cereals, raisins, oranges, olive, spart grass. In the town itself are flour and paper mills, sawmills, distilleries. The streets are broad, and have fine private residences, a modern town hall on the principal square, a large renaissance parish church, and a promenade styled La Glorieta.

**Cilicia,** the Roman Province, extended along the south coast of Asia Minor from the *Alara Su*, which separated it from Pamphylia, to the *Giaour Dagh*, M. Amanus, which parted it from Syria. Its northern limit was the crest of M. Taurus; its southern the sea. It was naturally divided into Cilicia Trachea, west of the *Lamas Su*, and Cilicia Pedias, east of that river. Cilicia Trachea is a rugged mountain district formed by the spurs of Taurus, which run southwards to the sea, and often terminate in rocky headlands with small sheltered harbours,—a feature which, in classical times, made the coast a favourite resort of pirates, and, in the Middle Ages, led to its occupation by Genoese and Venetian traders. The district is watered by the *Geuk Su* (Calycadnus and its tributaries), and is covered to a large extent by forests which still, as of old, supply timber to Egypt and Syria. There were several towns but no large trade centres. In the interior were Koropissus (*Da Bazár*), Olba (*Uzunjaburj*), and, in the valley of the Calycadnus, Claudiopolis (*Mút*), and Germanicopolis (*Ermenek*). On, or near the coast were Coracesium (*Alaya*), Selinus-Trajanopolis (*Selinti*), Anemeurium, Kelenderis (*Kilindria*), Seleucia (*Selefke*), Korykus (*Korghoz*), and Elæusa-Sebaste (*Ayash*). Roads connected Laranda, north of the Taurus, with Kelenderis and Seleuceia.

Cilicia Pedias included the rugged spurs of Taurus and a large plain which consists, in great part, of a rich stoneless loam. Its eastern half is studded with isolated rocky crags, which are crowned with the ruins of ancient strongholds, and broken by the low hills that border the plain of Issus. The plain is watered by the Cydnus (*Tersus Chai*), the Sarus (*Sihún*), and the Pyramus (*Jihún*), each of which brings down much silt. The Sarus now enters the sea almost due south of Tarsus, but there are clear indications that at one period it joined the Pyramus, and that the united rivers ran to the sea west of *Kara-tash*. Such appears to have been the case when Alexander's army crossed Cilicia. The plain is extremely productive, though now little cultivated (see ADANA). Through it ran the great highway, between the east and the west, on which stood Tarsus on the Cydnus, Adana on the Sarus, and Mopsuestia (*Missis*), on the Pyramus. North of the road between the two last places were Sision-Flaviopolis (*Sis*), Anazarbus (*Anazarba*), and Hieropolis-Kastabala (*Budrúm*); and on the coast were Soli-Pompeiopolis, Mallus (*Kara-tash*), Ægæ (*Ayash*), Issus, Baiæ (*Piyas*), and Alexandria ad Issum (*Alexandretta*). The great highway from the west, on its long rough descent from the Anatolian plateau to Tarsus, ran through a narrow pass between walls of rock called the Cilician Gate, *Ghulek Boghaz*. After crossing the low hills east of the Pyramus it passed through a masonry (Cilician) gate, *Demir Kapu*, and entered the plain of Issus. From that plain one road ran southward through a

masonry (Syrian) gate to Alexandretta and thence crossed M. Amanus by the Syrian Gate, *Beilan Pass*, to Antioch and Syria; and another ran northwards through a masonry (Amanian) gate, south of *Toprak Kaleh*, and crossed M. Amanus by the Amanian Gate, *Baghche Pass*, to North Syria and the Euphrates. By the last pass, which was apparently unknown to Alexander, Darius crossed the mountains prior to the battle of Issus. Both passes are short and easy, and connect Cilicia Pedias geographically and politically with Syria rather than with Asia Minor. Another important road connected Sision with Kokusos and Melitene. In Roman times Cilicia exported the goats'-hair cloth, Cilicium, of which tents were made.

Cilicia has been identified by some authorities with the Kuah and Helak of the emended texts of 1 Kings x. 28, and Ezek. xxvii. 11, and by Maspero with the Keti of the Egyptian inscriptions. The Cilicians appear to have belonged to that great family of non-Aryan tribes which included the Syro-Cappadocians, or Hittites, and the Proto-Armenians. Under the Persian Empire, Cilicia was apparently governed by tributary native kings who bore the name Syennesis. After Alexander's death it was loosely held by the Seleucid kings, and Cilicia Trachea became the haunt of pirates who were subdued by Pompey. Cilicia Pedias became Roman territory in 103 B.C., and the whole was organized by Pompey, 64 B.C., into a province which extended to and included part of Phrygia. It was reorganized by Cæsar, 47 B.C., and about 27 B.C. became part of the province Syria-Cilicia-Phœnice. At first the western district was left independent under native kings or priest-dynasts, and a small kingdom, under Tarkondimotus, was left in the east; but these were finally united to the province by Vespasian, A.D. 74. Under Diocletian, *circ.* 297, Cilicia, with the Syrian and Egyptian provinces, formed the Diocesis Orientis. In the 7th century it was invaded by the Arabs, who held the country until it was re-occupied by Nicephorus II. in 965.

The Seljúk invasion of Armenia was followed by an exodus of Armenians southwards, and in 1080 Rhupen, a relative of the last king of Ani, founded in the heart of the Cilician Taurus a small principality which gradually expanded into the kingdom of Lesser Armenia. This Christian kingdom—situated in the midst of Moslem states, hostile to the Byzantines, giving valuable support to the leaders of the Crusades, and trading with the great commercial cities of Italy—had a stormy existence of about 300 years. Gosdantin I. (1095–1100) assisted the Crusaders on their march to Antioch, and was created knight and marquis. Thoros I. (1100–1123), in alliance with the Christian princes of Syria, waged successful war against Byzantines and Seljúks. Levond II., "the Great" (1185–1219), extended the kingdom beyond Mount Taurus and established the capital at Sis. He assisted the Crusaders, and was crowned king by the archbishop of Mayence, and married one of the Lusignans of Cyprus. Haithon I. (1224–69) made an alliance with the Mongols, who, before their adoption of Islám, protected his kingdom from the Memlúks of Egypt. When Levond V. died (1342), John of Lusignan was crowned king as Gosdantin IV.; but he and his successors alienated the Armenians by attempting to make them conform to the Roman Church, and by giving all posts of honour to Latins, and at last the kingdom, a prey to internal dissensions, succumbed (1375) to the attacks of the Egyptians. Cilicia Trachea was occupied by the Osmanlis in the 15th century, but C. Pedias was only added to the empire in 1515. From 1833 to 1840 Cilicia formed part of the dominion of Mahommed Ali, who was compelled to evacuate it by the Allied Powers.

RAMSAY. *Historical Geography of Asia Minor*, 1890.—BENT and HICKS in *Journal of Hellenic Studies*, 1890.—STERRETT in *Journal Archæolog. Inst. of America*, 1884–85.—MARQUARDT. *Römische Staatsverwaltung*. (C. W. W.)

**Cilli** (*Slovene*, CELJE), an old and picturesque town with special charter and seat of a district administration in Styria (Austria). It is situated on the left bank of the Sann river, and is a station on the Southern Railway from Vienna to Trieste. Apart from the parish church, dating from the 14th century, Cilli furnishes some interesting specimens of mediæval architecture, such as the beautiful Gothic chapel and the so-called German church in the Romanesque style. Remains of the old walls and towers with which the town was once surrounded are yet visible, and memorials of a still earlier period of its history—Roman antiquities—are to be seen in the municipal museum. Cilli owes a good deal of its recent prosperity to the growing popularity of its river baths, which have converted it into a favourite summer resort. During the bathing season the water has a temperature of 75° to 85° Fahr. It has also a considerable trade in timber, iron, leather, corn, and coal, while its industries include zinc smelting and metal works, and the manufacture of chemicals, explosives, veneers, leather, brick and tiles, flour and beer. The town has latterly taken a somewhat prominent part in the nationality struggle; it was an educational concession to the Slovene element of the population which brought about the fall of the German, Clerical, and Polish coalition in June 1895. Population (1890), 6264; (1900), 6743 (about 75 per cent. German, and 25 per cent. Slovene; 99 per cent. Roman Catholic, and 1 per cent. Protestant).

Cilli, which is mentioned by the Elder Pliny, and whose origin was attributed to the Celts, was taken possession of by the Romans (15 B.C.) under the Emperor Claudius and received the name of Claudia Celeja. It was incorporated with Aquileia, under Constantine; and towards the end of the 6th century was destroyed by the invading Slavs. It had a period of exceptional prosperity from the middle of the 14th to the latter half of the 15th century under the Counts of Cilli, on the extinction of which family it fell to Austria. In the 16th century it suffered greatly both from revolts of the peasantry and from the Counter-Reformation, Protestantism having made many converts in the district, particularly among the nobles. (Æ. O'N.)

**Cincinnati**, the capital of Hamilton county, Ohio, U.S.A., situated on the north bank of the Ohio river, N. lat. 39° 6′, W. long. 84° 26′, the tenth city in population in the Union. The population in 1890 was 296,908, 71,408 being foreign-born, chiefly German, Irish, British, and Russian; in 1900 it was 325,902, of whom 57,961 were foreign-born and 14,482 were negroes. These figures do not include suburbs, with an estimated population of 60,000; nor the cities of Covington and Newport and adjoining towns on the south bank of the Ohio, with a population of 71,329. Five bridges connect Cincinnati with these cities, over three of which trolley cars run. There are forty-four lines of street cars extending many miles in all directions from a common central point in the city. These have pushed the area of residence and manufacture far beyond the surrounding hills on which are the original suburbs. The hill-tops are also reached by four inclined-plane cable railways. The climate is salubrious; the mean temperature in summer is 75·5° F., in winter 38·1°, and for the year 55·9°. The mean relative humidity is 71 per cent. According to the U.S. census, the death-rate of Cincinnati in 1890 was 21·0; in 1900 it was 19·2, showing a considerable decrease. There are 376 miles of improved streets largely paved with granite, asphalt, and brick. The adjoining parts of Ohio, Indiana, and Kentucky are thickly settled, and Cincinnati is the commercial centre of a rich, fertile, and populous region comprising parts of ten states. Sixteen lines of railway enter it from all directions, one of which—that to Chattanooga, 334 miles long—was built and is owned by the city. It cost $18,000,000, and is run by a lessee, at an annual rental of $1,000,000. Steam river navigation has declined as railways have increased, there being, in 1899, ninety vessels registered with a tonnage of 16,827. The National Government has improved and lighted the channel, and large quantities of coal, ore, iron, lumber, and salt float down in flatboats. Cincinnati is a growing seat of education. Besides the university of Cincinnati, with law, medical, and other departments, it contains St Xavier and other colleges and schools for general and special instruction, a college of music, an art school, a technical school, a mechanics' institute, a college of pharmacy, and a Hebrew union college for the education of rabbis, which is the only one of the kind in the United States. Scientific, social, historical, political, and other societies are numerous, many having buildings and libraries. There are 246 churches of 25

sects. There are 1 city, 1 United States, 4 private and 11 charity hospitals. A fresh-air home and farm for poor children has been established by private subscriptions. The art museum in Eden Park with galleries, &c. (cost of building, $350,000; endowment, $580,000), and separate buildings for art school and library, are the gift of citizens; as are also the music hall, with a seating capacity of 5000, where musical festivals occur biennially; and the library and two other buildings of the university in Burnet Woods Park. A large, well-appointed zoological garden is privately maintained, but not for profit. Among other new buildings are the United States building, which cost $5,000,000; the city hall, which cost $1,500,000; the court house, which replaces that burned by a mob in 1884; Chamber of Commerce, Armoury, Turner's hall, Odd Fellows' temple, Young Men's Christian Association, Union Trust Co., 17 storeys high; Queen City, Phœnix, and Cincinnati clubs. In the parks are statues of Presidents W. H. Harrison, Garfield, and Lincoln, and of Captain Desmond, killed in defending the court house. There are 11 daily newspapers and 214 other regular publications. The central situation of the city and its accessibility make it a common meeting-place for general bodies. The government is by a mayor, a board of legislation, and a general administrative board of public service of five members, all elective. The rate of taxation is 2·574 per cent; the public debt $25,546,456.43 (including the cost of the railway to Chattanooga); the city's credit is high, 3 per cent. bonds commanding a premium. The greatest recent growth of Cincinnati has been industrial. There are over 200 industries.

| Year. | Establishments. | Cash Capital and Property occupied. | Hands employed. | Products. |
|---|---|---|---|---|
| 1880 | 5493 | $108,635,220 | 74,798 | $148,957,280 |
| 1890 | 7832 | 136,419,558 | 96,689 | 196,063,983 |
| 1898 | 8667 | 171,581,264 | 115,944 | 236,162,060 |

Cincinnati ranks first in the United States in the manufacture of vehicles, harness, leather, hardwood lumber, wood-working machinery, machine tools, printing ink, soap, pig-iron, tobacco, and whisky, second in that of shoes, and fourth in that of clothing, cooperage, and pianos. The statistics for 1899 were :—

| | |
|---|---|
| Clothing | $25,457,000 |
| Cooperage | 3,288,500 |
| Harness | 5,250,000 |
| Hardwood lumber | 24,000,000 |
| Leather | 4,664,000 |
| Machine tools | 3,340,000 |
| Pianos | 2,500,000 |
| Pig-iron | 38,375,000 |
| Printing ink | 1,000,000 |
| Shoes | 9,619,838 |
| Soap | 9,826,500 |
| Tobacco | 9,256,414 |
| Vehicles | 9,750,000 |
| Whisky | 38,603,000 |
| Wood-working machinery | 1,550,000 |

There are 19 banks—other than Savings and Building and Loan Associations, which are numerous—with a capital of $8,415,000, and total clearings in 1899 of $748,490,350. (J. HA.)

**Cinematograph.**—The cinematograph is an application of photography to the zoëtrope. This apparatus shows in rapid sequence a series of views representing closely successive phases of a moving object, and persistence of vision creates the illusion that the object is in motion. The cinematograph, invented by Edison in 1894, is the result of the introduction of the flexible film into photography in place of glass. A long sensitized film is moved across the focal plane of a camera and exposed intermittently to moving objects. A series of images results, which when passed in rapid and intermittent succession before the eye gives the appearance of a photograph in motion. The original apparatus showed the film to a single observer, but in its perfected form it throws the successive images on a screen by means of a lantern so that an entire audience can see them. In one apparatus for making the exposures a cam jerks the film across the field once for each picture, the slack being gathered in on a drum at a constant rate. In another four lenses are rotated so as to give four images for each rotation, the film travelling so as to present a new portion in the field as each lens comes in place. Twenty-five to fifty pictures may be taken per second. At the slower rate it is found in practice that during the operation the film should be stationary about $\frac{1}{1}\frac{1}{2}$ths of the time. The films are developed on large drums, within which a ruby electric light may be fixed to enable the process to be watched. In the magic lantern an electric lamp or limelight of high power projects, through an objective lens, the successive images of the film upon a distant screen. Such subjects as an army on the march, or an express train at full speed, are presented with marvellous distinctness and completeness of detail. To regulate the feed in the lantern a hole is punched in the film for each picture. These holes must be extremely accurate in position. As they wear the feed becomes irregular, and the picture dances or vibrates in an unpleasant manner. For an hour's exhibition 50,000 to 165,000 pictures are needed, and they are fed at the rate of 26 miles an hour. A very simple system of exhibiting the views consists in attaching them by their lower edge transversely to a band which moves over two rollers. A detent at the top holds back the top edges so that they fly across, as the band rotates, like the leaves of a book. By looking at them at this point the effect of motion is produced. This method has been so simplified that little books of cinetoscopic views are sold, from which the moving effect is obtained by simply letting the leaves escape rapidly from the thumb as the book is bent backwards. (T. O'C. S.)

**Cintra,** a picturesque town of Portugal, district Lisbon, 16 miles north-west from Lisbon, in great repute as a summer resort owing to its salubrious climate. Many new villas have recently been built. Population, 4928.

**Ciotat, La,** a coast town and railway station, France, department of Bouches-du-Rhône, arrondissement of Marseilles, 20 miles south-east of that town. The port, easily accessible for vessels drawing 19 feet, is well sheltered, and defended by a battery. Large shipbuilding yards and repairing docks give employment to about 3000 workmen. Other important industries are the fisheries and the coral fishery. Coasting trade is actively carried on; the town is frequented for sea-bathing. Population (1881), 8045; (1901), 11,311.

**Circleville,** capital of Pickaway county, Ohio, U.S.A., on the east bank of Scioto river, which here is not navigable. It is on the Cincinnati and Muskingum Valley, and the Norfolk and Western Railways, at an altitude of 707 feet. Its manufactures consist in large part of furniture and agricultural implements. It occupies the site of ancient earthworks of the mound-builders, from one of which, a circle, it derives its name. Population (1880), 6046; (1900), 6991.

**Circulation of the blood.** See under PHYSIOLOGY (*Vascular System*) and PATHOLOGY (*Circulation*).

**Cittadella,** a town of Italy, Venetia, province of Padua, 23 miles north by west from Padua. It is still

surrounded with mediæval walls and towers, and possessed of a fine parish church, theatre, and botanical garden. It was founded in 1220 as a border defence of the people of Padua against Treviso. It has a technical school. Population, about 9500.

**Cittanova,** a town of Calabria, Italy, province of Reggio, 31 miles north-east from Reggio. It was built up out of the ruins of the former Casalnuovo (destroyed by an earthquake in 1783), and took its present name in 1852. It has olive-oil presses. Population, about 11,400.

**Ciudad Bolivar,** capital of the state of Bolivar in Venezuela, on the right bank of the Orinoco river, about 240 miles from the mouth, at an elevation of 187 feet above the sea. Up to 1846 it was known as Angostura. Its population numbers over 15,000. It is a great commercial centre for the whole Guiana region; the port through which all the gold is exported; maintains steamship communication with Trinidad; and is the starting-point for the steamers furnishing the mail, passenger, and freight service to all points on the upper Orinoco and between Apure and Nutrias. The market, cathedral, masonic temple, custom-house, university, and theatre are the most important buildings. The customs receipts for the year ending 30th June 1896 were 3,285,371 bolivars. The returns of shipping for 1898 were—entered 70 ships of 22,326 tons, cleared 59 ships of 21,762 tons. The value of the exports in 1897 was £339,197, and in 1898 it was £354,008. In 1897 the imports were valued at £243,845, and in 1898 at £233,800.

**Ciudad Real,** a province of South Central Spain divided into 10 administrative districts and 96 parishes, with an area of 7840 square miles. The population was 292,291 in 1887 and 305,002 in 1897. Only about 8000 acres are properly irrigated, 670,000 acres are covered with forests, and about 1200 square miles are covered with sparse vegetation and meagre brushwood. It is the grazing ground of large flocks, but the locust plague often destroys vast extents of pasture. Some of the rivers of Ciudad Real, like the Yavalon and Azuel, curiously rise from chalky soil, and from their very sources give abundant supplies of water to many mills. Almost the whole province is in the upper basin of the Guadiana, except the southernmost part, where several tributaries of the Guadalquivir water some districts. The means of communication, except the railways, are in a very bad condition. In 1897, out of 53,944 boys and girls between the ages of 4 and 14, there were 32,338 on the school registers, but only 22,601 really attended classes. The province has 280 miles of railways, and one will connect the important coal-mines of Puertollano with Cordova. One quicksilver, one zinc, 6 coal, and 18 lead mines were worked in 1898. The province produced 19,945 tons of quicksilver ore, 201,097 of coal, 4261 of lead, and 23,514 of argentiferous lead. The net increase of coal was 70,550 tons in 1898, being 54 per cent. over the figures of 1897. The mines employed in all 5257 men, 679 lads, 177 women. The live stock includes 12,001 horses, 36,051 mules, 33,380 asses, 21,680 cattle, 337,892 sheep, 196,501 goats, and 57,790 pigs. 288,437 acres are devoted to wheat crops, 136,037 to barley, 15,042 to rye, 7607 to oats, 3688 to pod fruit, 150,744 to vines, 80,045 to olives.

**Ciudad Real,** the capital of the above province, had a population of 14,700 in 1887, and 14,547 in 1897. It has fine modern schools, an institute, a training school for teachers, and some good public buildings, town hall, barracks, casinos, prison. The chief commerce of the town is in agricultural products and live stock at the weekly fairs.

**Civil List.**—The civil list is the account in which are contained all the expenses immediately applicable to the support of the British sovereign's household and the honour and dignity of the crown. An annual sum is settled by Parliament at the beginning of the reign on the sovereign, and is charged on the Consolidated Fund. But it is only from the reign of William IV. that the sum thus voted has been restricted solely to the personal expenses of the crown. Before his accession many charges properly belonging to the ordinary expenses of Government had been placed on the civil list. The history of the civil list dates from the reign of William and Mary. Before the Revolution no distinction had been made between the expenses of Government in time of peace and the expenses relating to the personal dignity and support of the sovereign. The ordinary revenues derived from the hereditary revenues of the crown, and from certain taxes voted for life to the king at the beginning of each reign, were supposed to provide for the support of the sovereign's dignity and the civil Government, as well as for the public defence in time of peace. Any saving made by the king in the expenditure touching the government of the country or its defence would go to swell his privy purse. But with the Revolution a step forward was made towards the establishment of the principle that the expenses relating to the support of the crown should be separated from the ordinary expenses of the State. The evils of the old system under which no appropriation was made of the ordinary revenue granted to the crown for life had been made manifest in the reign of Charles II. and James II.; it was their control of these large revenues that made them so independent of Parliament. Moreover, while the civil Government and the defences suffered, the king could use these revenues as he liked. The Parliament of William and Mary fixed the revenue of the crown in time of peace at £1,200,000 per annum; of this sum about £700,000 was appropriated towards the "civil list." But from this the sovereign was to defray the expenses of the civil service and the payment of pensions, as well as the cost of the support of the royal household and his own personal expenses. It was from this that the term "civil list" arose, to distinguish it from the statement of military and naval charges. The revenue voted to meet the civil list consisted of the hereditary revenues of the crown and a part of the excise duties. Certain changes and additions were made in the sources of revenue thus appropriated between the reign of William and Mary and the accession of George III., when a different system was adopted. Generally speaking, however, the sources of revenue remained as settled at the Revolution.

*History.*

Anne had the same civil list, estimated to produce an annual income of £700,000. During her reign a debt of £1,200,000 was incurred. This debt was paid by Parliament and charged on the civil list itself. George I. enjoyed the same revenue by parliamentary grant, in addition to an annual sum of £120,000 on the Aggregate Fund. A debt of £1,000,000 was incurred, and discharged by Parliament in the same manner as Anne's debt had been. To George II. a civil list of £800,000 as a minimum was granted, Parliament undertaking to make up any deficiency if the sources of income appropriated to its service fell short of that sum. Thus in 1746 a debt of £456,000 was paid by Parliament on the civil list. On the accession of George III. a change was made in the system of the civil list. Hitherto the sources of revenue appropriated to the service of the civil list had been settled on the crown. If these revenues exceeded the sum they were computed to produce annually, the surplus went to the king. George III., however, surrendered the life-interest in the hereditary

*Anne, George I., and George II.*

*George III.*

revenues and the excise duties hitherto voted to defray the civil list expenditure, and any claim to a surplus for a fixed amount. The king still retained other large sources of revenue which were not included in the civil list, and were free from the control of Parliament. The revenues from which the civil list had been defrayed were henceforward to be carried into, and made part of, the Aggregate Fund. In their place a fixed civil list was granted—at first of £723,000 per annum, to be increased to £800,000 on the falling in of certain annuities to members of the royal family. From this £800,000 the king's household and the honour and dignity of the crown were to be supported, as well as the Civil Service offices, pensions, and other charges still laid on the list.

During the reign of George III. the civil list played an important part in the history of the struggle on the part of the king to establish the royal ascendancy. From the revenue appropriated to its service came a large portion of the money employed by the king in creating places and pensions for his supporters in Parliament, and, under the colour of the royal bounty, bribery was practised on a large scale. No limit was set to the amount applicable to the pensions charged on the civil list, so long as the sum granted could meet the demand; and there was no principle on which the grant was regulated. Secret pensions at the king's pleasure were paid out of it, and in every way the independence of Parliament was menaced; and though the more legitimate expenses of the royal household were diminished by the king's penurious style of living, and though many charges not directly connected with the king's personal expenditure were removed, the amount was constantly exceeded, and applications were made from time to time to Parliament to pay off debts incurred; and thus opportunity was given for criticism. In 1769 a debt of £513,511 was paid off in arrears; and in spite of the demand for accounts and for an inquiry into the cause of the debt, the ministry succeeded in securing this vote without granting such information. All attempts to investigate the civil list were successfully resisted, though Lord Chatham went so far as to declare himself convinced that the funds were expended in corrupting members of Parliament. Again, in 1777, an application was made to Parliament to pay off £618,340 of debts; and in view of the growing discontent Lord North no longer dared to withhold accounts. Yet, in spite of strong opposition and free criticism, not only was the amount voted, but also a further £100,000 per annum, thus raising the civil list to an annual sum of £900,000.

*Indebtedness of civil list.*

In 1779, at a time when the expenditure of the country and the national debt had been enormously increased by the American war, the general dissatisfaction found voice in Parliament, and the abuses of the civil list were specially singled out for attack. Many petitions were presented to the House of Commons praying for its reduction, and a motion was made in the House of Lords in the same sense, though it was rejected. In 1780 Burke brought forward his scheme of economic reform, but his name was already associated with the growing desire to remedy the evils of the civil list by the publication in 1769 of his pamphlet on "The Causes of the Present Discontent." In this scheme Burke freely animadverts on the profusion and abuse of the civil list, criticizing the useless and obsolete offices and the offices performed by deputy. In every department he discovers jobbery, waste, and peculation. His proposal was that the many offices should be reduced and consolidated, that the pension list should be brought down to a fixed sum of £60,000 per annum, and that pensions should be conferred only to reward merit or fulfil real public charity. All pensions were to be paid at the Exchequer. He proposed also that the civil list should be divided into classes, an arrangement which later was carried into effect. In 1780 Burke succeeded in bringing in his Establishment Bill; but though at first it met with considerable support, and was even read a second time, Lord North's Government defeated it in committee. The next year the Bill was again introduced into the House of Commons, and Pitt made his first speech in its favour. The Bill was, however, lost on the second reading.

In 1782 the Rockingham Ministry, pledged to economic reform, came into power; and the Civil List Act, 1782, was introduced and carried with the express object of limiting the patronage and influence of ministers, or, in other words, the ascendancy of the crown over Parliament. Not only did the Act effect the abolition of a number of useless offices, but it also imposed restraints on the issue of secret service money, and made provision for a more effectual supervision of the royal expenditure. As to the pension list, the annual amount was to be limited to £95,000; no pension to any one person was to exceed £1200, and all pensions were to be paid at the Exchequer, thus putting a stop to the secret pensions payable during pleasure. Moreover, pensions were only to be bestowed in the way of royal bounty for persons in distress or as a reward for merit. Another very important change was made by this Act: the civil list was divided into classes, and a fixed amount was to be appropriated to each class. The following were the classes:—

*Civil List Act, 1782.*

1. Pensions and allowances of the royal family.
2. Payment of salaries of Lord Chancellor, Speaker, and judges.
3. Salaries of ministers to foreign courts resident at the same.
4. Approved bills of tradesmen, artificers, and labourers for any article supplied and work done for His Majesty's service.
5. Menial servants of the household.
6. Pension list.
7. Salaries of all other places payable out of the civil list revenues.
8. Salaries and pensions of treasurer or commissioners of the treasury and of the Chancellor of the Exchequer.

Yet debt was still the condition of the civil list down to the end of the reign, in spite of the reforms established by the Rockingham Ministry, and notwithstanding the removal from the list of many charges unconnected with the king's personal expenses. The debts discharged by Parliament between 1782, the date of the passing of the Civil List Act, and the end of George III.'s reign, amounted to £2,300,000. In all, during his reign £3,398,061 of debt owing by the civil list was paid off.

With the regency the civil list was increased by £70,000 per annum, and a special grant of £100,000 was settled on the Prince Regent. In 1816 the annual amount was settled at £1,083,727, including the establishment of the king, now insane; though the civil list was relieved from some annuities payable to the royal family. Nevertheless, the fund still continued charged with such civil expenses as the salaries of judges, ambassadors, and officers of state, and with pensions granted for public services. Other reforms were made as regards the definition of the several classes of expenditure, while the expenses of the royal household were henceforth to be audited by a Treasury official—the auditor of the civil list. On the accession of George IV. the civil list, freed from the expenses of the late king, was settled at £845,727. On William IV. coming to the throne a sum of £510,000 per annum was fixed for the service of the civil list. The king at the same time surrendered all the sources of revenue enjoyed by his predecessors, apart from the civil list, represented by the hereditary revenues of Scotland—the Irish civil list, the droits of the crown and admiralty, the 4½ per cent. duties, the West India duties, and other

casual revenues hitherto vested in the crown, and independent of Parliament. The revenues of the duchy of Lancaster were still retained by the crown. In return for this surrender and the diminished sum voted, the civil list was relieved from all the charges relating rather to the civil Government than to the support of the dignity of the crown and the royal household. The future expenditure was divided into five classes, and a fixed annual sum was appropriated to each class. The pension list was reduced to £75,000. The king resisted an attempt on the part of the select committee to reduce the salaries of the officers of state on the grounds that this touched his prerogative, and the ministry of Earl Grey yielded to his remonstrance.

The civil list of Queen Victoria was settled on the same principles as that of William IV. A considerable reduction was made in the aggregate annual sum voted, from £510,000 to £385,000, and the pension list was separated from the ordinary civil list. The civil list proper was divided into the following five classes, with a fixed sum appropriated to each:—

*Queen Victoria's civil list.*

| | |
|---|---|
| Privy purse | £60,000 |
| Salaries of household | 131,260 |
| Expenses of household | 172,500 |
| Royal bounty, &c. | 13,200 |
| Unappropriated | 8,040 |

In addition the Queen might, on the advice of her ministers, grant pensions up to £1200 per annum, in accordance with a resolution of the House of Commons of 18th February 1834, "to such persons as have just claims on the royal beneficence, or who, by their personal services to the crown, by the performance of duties to the public, or by their useful discoveries in science and attainments in literature and art, have merited the gracious consideration of the sovereign and the gratitude of their country." The service of these pensions increased the annual sum devoted to support the dignity of the crown and the expenses of the household to about £409,000. The list of pensions must be laid before Parliament within thirty days of 20th June. Thus the civil list was reduced in amount, and relieved from the very charges which gave it its name as distinct from the statement of military and naval charges. It now really only dealt with the support of the dignity and honour of the crown and the royal household. The arrangement was most successful, and during the last three reigns there was no application to Parliament for the discharge of debts incurred on the civil list.

The death of Queen Victoria rendered it necessary that a renewed provision should be made for the civil list; and King Edward VII., following former precedents, placed unreservedly at the disposal of Parliament his hereditary revenues. A select committee of the House of Commons was appointed to consider the provisions of the civil list for the crown, and to report also on the question of grants for the honourable support and maintenance of Her Majesty the Queen and the members of the royal family. The committee in their conclusions were guided to a considerable extent by the actual civil list expenditure during the last ten years of the last reign, and made certain recommendations which, without undue interference with the sovereign's personal arrangements, tended towards increased efficiency and economy in the support of the sovereign's household and the honour and dignity of the crown. On their report was based the Civil List Act, 1901, which established the new civil list. The system that the hereditary revenues should as before be paid into the exchequer and be part of the consolidated fund was maintained. The amount payable for the civil list was increased from £385,000 to £470,000. In the application of this sum the number of classes of expenditure to which separate amounts are to be appropriated is increased from five to six. The following is the new arrangement of classes:—1st class, Their Majesties' privy purse, £110,000; 2nd class, salaries of His Majesty's household and retired allowances, £125,800; 3rd class, expenses of His Majesty's household, £193,000; 4th class, works (the interior repair and decoration of Buckingham Palace and Windsor Castle), £20,000; 5th class, royal bounty, alms, and special services, £13,200; 6th class, unappropriated, £8000. The system relating to civil list pensions, established by the Civil List Act, 1837, continues to apply, but the pensions are not to be regarded as chargeable on the sum paid for the civil list. The committee also advised that the mastership of the Buckhounds should not be continued; and His Majesty, on the advice of his ministers, agreed to accept their recommendation. The maintenance of the royal hunt thus ceases to be a charge on the civil list. The annuities of £20,000 to the prince of Wales, of £10,000 to the princess of Wales, and of £18,000 to His Majesty's three daughters, are not included in the civil list, though they are conferred by the same Act. Other grants made by special Acts of Parliament to members of the royal family are also excluded from it. (H. S. S.)

*Civil List Act, 1901.*

**Civil Service.** — *British Empire.* — The civil service is the generic name given to all public servants. It is the machinery by which the executive, through the various administrations, carries on the central government of the country. The cost of the civil services has increased of late years. The net total of the estimates for the civil services for 1901–2 was £23,630,120, as opposed to £22,838,808 for 1900–1. The increase (after the adjustment of certain items) was £783,812, as opposed to the increase of £659,143 in 1900–1.

The appointments to the civil service until the year 1855 were made by nomination, with an examination not sufficient to form an intellectual or even a physical test. It was only after much consideration and almost years of discussion that the nomination system was abandoned. Various commissions reported on the civil service, and Orders in Council were issued. Finally in 1855 a qualifying examination of a stringent character was instituted, and in 1870 the principle of open competition was adopted as a general rule. On the report of the Playfair Commission (1876), an Order in Council was issued dividing the civil service into an upper and lower division. The Order in Council directed that a lower division should be constituted, and men and boy clerks holding permanent positions replaced the temporary assistants and writers. The "temporary" assistant was not found to be advantageous to the service. In December 1886 a new class of assistant clerks was formed to replace the men copyists. In 1887 the Ridley Commission reported on the civil service establishment. In 1890 two Orders in Council were issued based on the reports of the Ridley Commission, which sat from 1886 to 1890. The first Order constituted what is now known as the second division of the civil service. The second Order in Council concerns the officers of the 1st class, and provision was made for the possible promotion of the second division clerks to the first division after eight years' service.

The whole system is under the administration of the Civil Service Commissioners, and power is given to them, with the approval of the Treasury, to prescribe the subjects of examination, limits of age, &c. The age is fixed for compulsory retirement at sixty-five. In exceptional cases a prolongation of five years is within the powers of the Civil

Service Commissioners. The examination for 1st class clerkships is held concurrently with that of the civil service of India and Eastern cadetships in the colonial service. Candidates can compete for all three or for two. In addition to the intellectual test the candidate must fulfil the conditions of age (22 to 24), must present recommendations as to character, pass a medical examination, and must also pay a fee of £6. The subjects include the language and literature of England, France, Germany, ancient Greece and Rome, Sanscrit and Arabic, mathematics (pure and applied), natural science, history (English, Greek, Roman, and general modern), political economy and economic history, mental and moral philosophy, Roman and English law and political science. The candidate is obliged to reach a certain standard of knowledge in each subject before any marks at all are allowed him. This rule was made to prevent success by mere cramming, and to ensure competent knowledge on the basis of real study. Clerks of Class I. are employed in the following departments and offices :—

Admiralty, Head Office and Outposts.
Agriculture, Board of.
Chief Secretary's Office, Ireland.
Civil Service Commission.
Colonial Office.
Constabulary, Ireland (Inspector-General's Office).
Customs.
Exchequer and Audit Departments.
Home Office.
India Office (Correspondence, Political, Accountant-General's Store and Audit Departments).
Inland Revenue.
Local Government Board, England and Ireland.
Lunacy Commission.
Patent Office.
Post Office.
Privy Council Office.
Record Offices, England and Ireland.
Science and Art Department.
Scottish Office.
Supreme Court Pay Office, England.
Trade, Board of.
Treasury.
War Office.

The maximum scale of the salaries of clerks of Class I. is as follows :—3rd class, £200 a year, increasing by £20 a year to £500; 2nd class, £600, increasing by £25 a year to £800; 1st class, £850, increasing by £50 a year to £1000. Their pensions are fixed by the Superannuation Act 1859, 22 Vict. c. 26 :—

"To any person who shall have served ten years and upwards, and under eleven years, an annual allowance of ten-sixtieths of the annual salary and emoluments of his office :

"For eleven years and under twelve years, an annual allowance of eleven-sixtieths of such salary and emoluments :

"And in like manner a further addition to the annual allowance of one-sixtieth in respect of each additional year of such service, until the completion of a period of service of forty years, when the annual allowance of forty-sixtieths may be granted ; and no additions shall be made in respect of any service beyond forty years."

The "ordinary annual holidays allowed to officers" (1st class) "shall not exceed thirty-six week-days during each of their first ten years of service and forty-eight week-days thereafter." Order in Council, 15th August 1890.

"Within that maximum heads of departments have now, as they have hitherto had, an absolute discretion in fixing the annual leave."

Sick leave can be granted on full salary for not more than six months, on half salary for another six months.

The scale of salary for 2nd division clerks begins at £70 a year, increasing by £5 to £100; then £100 a year, increasing by £7, 10s. to £190; and then £190 a year, increasing by £10 to £250. The highest is £300 to £500. Advancement in the 2nd division to the higher ranks depends on merit, not seniority. The ordinary annual holiday of the 2nd division clerks is 14 working days for the first five years, and 21 working days afterwards. They can be allowed sick leave for six months on full pay and six months on half pay. The subjects of their examination are :—(1) handwriting and orthography, including copying MS. ; (2) arithmetic ; (3) English composition ; (4) précis, including indexing and digest of returns ; (5) book-keeping and shorthand writing ; (6) geography and English history ; (7) Latin or French or German ; (8) elementary mathematics ; (9) inorganic chemistry with elements of physics. Not more than four of the subjects, (4) to (9), are to be taken. The candidate must be between the ages of 17 and 20. The fee is £2. A certain number of the places in the 2nd division were reserved for the candidates from the boy clerks appointed under the old system. The severity of the competition is shown by the fact that in February 1900 there were 932 candidates for 120 places. Candidates are allowed a choice of departments subject to the exigencies of the services. The departments are as follows :—

Agriculture, Board of.
Admiralty.
British Museum.
Chancery Department (Edinburgh).
Charity Commission.
Chelsea Hospital.
Chief Secretary's Office (Dublin).
Chief Secretary's Office, Veterinary Department.
Civil Service Commission.
Colonial Office.
Constabulary (Ireland), Inspector-General's Office.
Customs (London, Liverpool, and Outposts).
Deeds, Registry of (Dublin).
Dublin Metropolitan Police Office.
Education Department.
Exchequer and Audit Office.
Exchequer Office (Scotland).
Fisheries Office (Dublin).
Fishery Board (Scotland).
Foreign Office.
Friendly Societies Registry.
Home Office.
Inland Revenue—
  Offices in London.
  Offices in Edinburgh.
  Offices in Dublin.
Local Government Board (London).
Local Government Board (Edinburgh).
Local Government Board (Dublin).
Lunacy Commission.
Mint.
National Debt Office.
National Education Office (Dublin).
Paymaster-General's Office (London and Dublin).
Pay Office of the Supreme Court.
Post Office (London).
Post Office (Edinburgh).
Post Office (Dublin).
Prisons Board (Dublin).
Prisons Department (Edinburgh).
Privy Council Office.
Public Works Loan Office.
Public Works Office (Dublin).
Reformatories Office.
Registrar-General's Office (London).
Registrar-General's Office (Edinburgh).
Registrar-General's Office (Dublin).
Science and Art Department (London).
Science and Art Department (Dublin).
Scotland, Office of Secretary for.
Scottish Education Department.
Stationery Office.
Supreme Court of Judicature (Ireland) Accounting Office.
Teachers' Pension Office (Dublin).
Trade, Board of.
Trade, Board of ; Bankruptcy Department.
Trade, Board of ; Commercial, Labour, and Statistical Department.
Trade, Board of ; Patents Office.
Seamen's Registry Office.
Treasury.
Treasury, Remembrancer's Office (Dublin).
Valuation Office (Dublin).
War Office.
War Office, Royal Army Clothing Depot.
Works, Office of.

The total number of 2nd division clerks employed is 2945.

A new class of assistant clerks or abstractors was formed in 1886. The appointments are made from the ranks of the men copyists. The maximum salary is about £150. Now only 93 men copyists remain, so this source for candidates is practically exhausted, but open competition has not yet been instituted for the assistant clerkships. The subjects of the examination that is held are — handwriting, orthography, arithmetic, English composition, digesting returns into summaries, and geography. A competent amount of general proficiency is insisted upon. This new class has been introduced into the following offices :—Admiralty, Board of Agriculture, Census Office, Charity Commission, Customs, Education Department, General Registrar Office, Home Office, Irish Land Commission, Inland Revenue, Local Government Board (England and Ireland), General Post Office (Savings Bank Department, London and Dublin), Prisons Commission (England and Scotland), Public Works Loan Board, General Prisons Board (Ireland), Registrar-General's Office (Dublin), Science and Art Department, Seamen's Registry Office, Board of Trade, Treasury, War Office, and Office of Woods (Quit Rent Office, Dublin).

A new class of boy copyists has also been established. They are almost entirely employed in London, a few in Dublin and Edinburgh, and, very seldom, in some provincial towns. The subjects of their examination are : *Obligatory*—handwriting and orthography, arithmetic, and English composition. *Optional*—(any two of the following) : (1) copying MS. ; (2) geography ; (3)

English history; (4) translation from one of the following languages—Latin, French, or German; (5) Euclid, bk. i. and ii., and algebra, up to and including simple equations; (6) rudiments of chemistry and physics. Candidates must be between the ages of fifteen and eighteen. They have no claims to superannuation or compensation allowance. Boy copyists will not be retained after the age of twenty.

Candidates for the *Civil Service of India* take the same examination as for 1st class clerkships. Candidates successful in the examination must subsequently spend one year in England. They receive for that year £100 if they elect to live at one of the universities or colleges approved by the Secretary of State for India. At the close of this year they will be submitted to a final examination in the following subjects—Indian Penal Code and the Code of Criminal Procedure, the principal vernacular language of the province to which they are assigned, the Indian Evidence Act (these three subjects are compulsory), the Code of Civil Procedure and the Indian Contract Act, Hindu and Mahommedan Law, Sanscrit, Arabic, Persian, the history of British India, Chinese (for Burma only). Of these seven two are to be selected, but a candidate may not take Arabic or Sanscrit both in the first examination and in the final. They must also pass a thorough examination in riding, which is conducted at the Royal Artillery Riding School at Woolwich. On reaching India their salary begins at 400 rupees a month. In 1899 the value of the rupee was permanently fixed by Government at 1s. 4d. They may take, as leave, one-fourth of the time on active service in periods strictly limited by regulation. After twenty-five years' service (of which twenty-one must be active service) they can retire on a pension of £1000 a year. The unit of administration is the district. At the head of the district is an executive officer called either collector-magistrate or deputy-commissioner. In most provinces he is responsible to the commissioner, who corresponds directly with the provincial government. The Indian civilian after four years' probation in both branches of the service is called upon to elect whether he will enter the revenue or judicial department, and this choice as a rule is held to be final for his future work.

Candidates for the Indian Forest Service have to pass a competitive examination, one of the compulsory subjects being German. They have also to pass a severe medical examination, especially in their powers of vision and hearing. They must be between the ages of seventeen and twenty. Successful candidates are required to pass a three years' course, with a final examination, seven terms of the course at Cooper's Hill, the rest of the time receiving practical instruction in Continental forests. The obligatory expenses at Cooper's Hill are £61 a term, and £150 is charged for the time abroad. On reaching India they start as assistant conservators at 250 rupees a month. The highest salary, that of inspector-general of forests, in the India Forest Service is 2000 rupees a month.

The Indian Police Service is entered by a competitive examination of very much the same kind as for the Forests, except that special subjects such as German and botany are not included. The candidates are limited in age to nineteen and twenty-one. They must pass a riding examination. A free passage out is given them. They are allotted as probationers, their wishes being consulted as far as possible as to their province. A probationer receives 250 rupees a month. A district superintendent can rise to 1000 rupees a month, while there are a few posts with a salary of 2500 rupees a month in the Police Service. The leave and pension in both these departments follow the general rules for Indian services.

The Civil Service also includes student interpreterships for China, Japan, and Siam, and for the Ottoman dominions, Persia, Greece, and Morocco. Both these classes of student interpreters are selected by open competition. Their object is to supply the consular service in the above-named countries with persons having a thorough knowledge of the language of the country in which they serve.

In the first case, China, Japan, &c., they learn their language in the country itself, receiving £200 as probationers. Then they become assistants in a consulate. The highest post is that of consul-general. In the case of student interpreters for the Ottoman dominions, Persia, Greece, and Morocco, the successful candidates learn their languages at Oxford. Turkish is taught gratuitously, but they pay the usual fees for other languages. At Oxford they receive £200 a year for two years. On leaving Oxford they become assistants under the embassy at Constantinople, the legations at Teheran, Athens, or Morocco, or at one of H.B.M. consulates. As assistants they receive £300 a year. The consuls, the highest post to which they can reach, receive in the Levant from £500 to £1600 a year. The civil services of Ceylon, Hong-Kong, the Straits Settlements, and the Malay Peninsula are supplied by the Eastern cadetships. The limits of age for the examination are twenty-one and twenty-four. The cadets are required to learn the native language of the colony or dependency to which they are assigned. In the case of the Straits Settlements and Malay cadets they may have to learn Chinese or Tamil, as well as the native language. The salaries are: passed cadets, 3500 rupees per annum, gradually increasing until first-class officers receive from 12,000 to 18,000 rupees per annum. They are allowed three months' vacation on full pay in two years, and leave of absence on half pay after six years' service, or before that if urgently needed. They can retire for ill-health after ten years with fifteen-sixtieths of their annual salary. Otherwise they can add one-sixtieth of their annual salary to their pension for every additional year's service up to thirty-five years' service.

In spite of the general rule of open competition, there are still a few departments where the system of *nomination* obtains, accompanied by a severe test of knowledge. In the following offices it is so for some of the appointments.

Foreign Office (all the following posts):—8 ambassadors, 16 ministers plenipotentiary, 10 ministers resident, 2 agents and consuls-general, 8 secretaries of embassy, 15 secretaries of legation, 6 commercial attachés, 34 2nd secretaries, 23 3rd secretaries (attachés): Metropolitan police courts; mines; naval service, assistant clerks; post office secretary's office, supplementary, office of the controller of stores; British Museum; clerks of the two Houses of Parliament; Royal Irish Constabulary; Board of Education; Education Office for Ireland; Inspectors of Factories.

The employment of *women* in the Civil Service has not yet been much developed except in the Post Office. Women are employed in the Post Office as female clerks, counter clerks, telegraphists, returners, sorters, and post-mistresses all over the United Kingdom. In 1881 the Postmaster-General took a decided step in favour of female employment, and with the consent of the Treasury instituted *female clerkships*. Female clerks do not come in contact with the public. Their duties are purely clerical, and entirely in the accountant-general's department at the Savings Bank.

Their *leave* is one month per annum, their *pension* is on the ordinary Civil Service scale. The *examination* is competitive, the subjects are handwriting and spelling, arithmetic, English composition, geography, English history, French or German. Candidates must be between the ages of 18–20. Whether unmarried or widows they must resign on marriage. The class of *girl clerks* take the same subjects in a competitive examination. They must be between the ages of 16–18; they serve only in the Savings Bank department. If competent they can pass on later to female clerkships. The salaries of the female clerkships range from £200 to £500 in the higher grade, £55 to £190 in the 2nd class, whilst girl clerks are paid from £35 to £40, with the chance of advancement to higher posts. The total of women employed by the Post Office and telegraphs is not to be found in official returns, but women are now so largely employed not only in the higher grades, but as sorters, counter clerks, telegraphists in London and throughout the country that the aggregate number is very considerable. For instance, there are 778 sorters, counter clerks, and telegraphists in the Metropolitan district alone.

In other departments there is a notable increase in female employment. The Board of Agriculture, the Customs, and the India Office employ women. The Department of Agriculture, Technical Education, the Board of Education generally, the Local Government Board, all to a certain extent employ women, whilst in the Home Office there are seven women inspectors of Workshops and Factories. (JNO. S.)

*United States.*—Civil Service Reform, like other great administrative reforms, began in America in the latter half of the 19th century. Personal and partisan government, with

all the entailed evils of the patronage system, culminated in Great Britain during the reign of George III., and was one of the efficient causes of the American revolution. Trevelyan characterizes the use of patronage to influence legislation, and the giving of colonial positions as sinecures to the privileged classes and personal favourites of the administration, by saying, "It was a system which, as its one achievement of the first order, brought about the American war, and made England sick, once and for all, of the very name of personal Government." It was natural that the founders of the new Government in America, after breaking away from the mother-country, should strive to avoid the evils which had in a measure brought about the revolution. Their intention that the administrative officers of the Government should hold office during good behaviour is manifest, and was given thorough and practical effect by every administration during the first forty years of the life of the Government. The constitution fixed no term of office in the executive branch of the Government except those of president and vice-president; and Madison, the expounder of the constitution, held that the wanton removal of a meritorious officer was an impeachable offence. Not until nine years after the passage of the Four Years' Tenure of Office Act in 1820 was there any material departure from this traditional policy of the Government. This Act (suggested by an appointing officer who wished to use the power it gave in order to secure his own nomination for the presidency, and passed without debate and apparently without any adequate conception of its full effect) opened the doors of the service to all the evils of the "spoils system." The foremost statesmen of the time were not slow to perceive the baleful possibilities of this legislation, Jefferson,[1] Webster, Clay, Calhoun, Benton, and many others being recorded as condemning and deploring it in the strongest terms. The transition to the "spoils system" was not, however, immediate, and for the next nine years the practice of reappointing all meritorious officers was practically universal; but in 1829 this practice ceased and the Act of 1820 lent the sanction of law to the system of proscriptions which followed, which was a practical application of the theory that "to the victor belong the spoils of the enemy." In 1836 the provisions of this law, which had at first been confined mainly to officers connected with the collection of revenue, were extended to include also all postmasters receiving a compensation of $1000 per annum or more. It rapidly became the practice to regard all these four years' tenure offices as agencies not so much for the transaction of the public business as for the advancement of political ends. The revenue service from being used for political purposes merely came to be used for corrupt purposes as well, with the result that in one administration frauds were practised upon the Government to the extent of $75,000,000. The corrupting influences permeated the whole body politic. Political retainers were selected for appointment not on account of their ability to do certain work but because they were followers of certain politicians; these "public servants" acknowledged no obligation except to those politicians, and their public duties, if not entirely disregarded, were negligently and inefficiently performed. Thus grew a saturnalia of spoils and corruption which culminated in the assassination of a president.

*The "spoils" system.*

Acute conditions, not theories, give rise to reforms. In the congressional election of November 1882, following the assassination of President Garfield as an incident in the operation of the spoils system, the voice of the people commanding reform was unmistakable. Congress assembled in December 1882, and during the same month a bill looking to the improvement of the civil service, which had been pending in the Senate for nearly two years, was finally taken up and considered by that body. In the debate upon this bill its advocates declared that it would "vastly improve the whole civil service of the country," which they characterized as being at that time "inefficient, expensive, and extravagant, and in many instances corrupt."[2] This bill passed the Senate on 27th December 1882, and the House on 4th January 1883, and was signed by the president on 16th January 1883, coming into full operation on 16th July 1883. It is now the national civil service law. The fundamental principles of this law are:—(1) selection by competitive examination for all appointments to the "classified service," with a period of probationary service before absolute appointment; (2) apportionment among the states and territories, according to population, of all appointments in the departmental service at Washington; (3) freedom of all the employees of the Government from any necessity to contribute to political campaign funds or to render political services. For putting these principles into effect the Civil Service Commission was created, and penalties were imposed for the solicitation or collection from government employees of contributions for political purposes, and for the use of official positions in coercing political action. The commission, in addition to its regular duties of aiding in the preparation of civil service rules, of regulating and holding examinations, and certifying the results thereof for use in making appointments, and of keeping records of all changes in the service, was given authority to investigate and report upon any violations of the Act or rules. The "classified" service to which the Act applies has grown, by the action of successive presidents in progressively including various branches of the service within it, from 13,924 positions in 1883 to some 80,000 (in round numbers) in 1900, constituting now about 40 per cent. of the entire civil service of the Government and including practically all positions above the grade of mere labourer or workman to which appointment is *not* made directly by the president with the consent of the Senate.[3] A very large class to which the Act is expressly applicable, and which has not been brought within its provisions by executive action, is that of fourth-class postmasters, of whom there are between 70,000 and 80,000.

*Law of 1883.*

In order to provide registers of eligibles for the various grades of positions in the classified service, the United States Civil Service Commission now holds annually throughout the country about 300 different kinds of examinations. In the work of preparing these examinations and of marking the papers of competitors in them, the commission is authorized by law to avail itself, in addition to its own corps of trained men, of the services of the scientific and other experts in the various executive departments. In the work of holding the examinations it is aided by about 1300 local boards of examiners, which are its local representatives throughout the country and are located at the principal post offices, custom houses, and other government offices, being composed of three or more Federal employees in those offices. About 50,000 persons

[1] See letter to Monroe, 29th November 1820, Jefferson's *Writings*, vii. p. 190. A quotation from this letter is given at p. 454 of the *Fifteenth Report of the U.S. Civil Service Commission.*

[2] See *Senate Report No. 576*, 47th Congress, 1st session; also *U.S. Civil Service Commission's Third Report*, p. 16 *et seq.*, *Tenth Report*, pp. 136, 137, and *Fifteenth Report*, pp. 483, 484.

[3] The progressive classification of the executive civil service, showing the growth of the merit system, is discussed, with statistics, in the *U.S. Civil Service Commission's Sixteenth Report*, pp. 129–37. A revision of this discussion, with important additions, appears in the *Seventeenth Report.*

annually compete in these examinations, and about 10,000 of those who are successful receive appointments through regular certification. Persons thus appointed, however, must serve six months "on probation" before their appointment can be made absolute. At the end of this probation, if his service has not been satisfactory, the appointee is simply dropped; and the fact that less than 1 per cent. of those appointed prove thus deficient on trial is high testimony to the practical nature of the examinations held by the commission, and to their aptness for securing persons qualified for all classes of positions.

The effects of the Civil Service Act within the scope of its actual operation have amply justified the hopes and promises of its advocates. After its passage, absentee holders of lucrative appointments were required to report for duty or to sever their connexion with the service. Improved methods were adopted in the departments, and superfluous and useless work was no longer devised in order to provide a show of employment and a *locus standi* for the parasites upon the public service. Individual clerks were required, and by reason of the new conditions were enabled, to do more and better work; and this, coupled with the increase in efficiency in the service on account of new blood coming in through the examinations, made possible an actual decrease in the force required in many offices, notwithstanding the natural growth in the amount of work to be done.[1] Experience proves that the desire to create new and unnecessary positions was in direct proportion to the power to control them, for where the Act has taken away this power of control the desire had disappeared naturally. There is no longer any desire on the part of heads of departments to increase the number or salaries of classified positions which would fall by law within the Civil Service rules and be subject to competitive examinations. Thus the promises of improvement and economy in the service have been fulfilled.

The chief drawback to the full success of the Act within its intended scope of operation has been the withholding of certain positions in the service from the application of the vital principle of competition. The Civil Service Act contemplated no exceptions, within the limits to which it was made applicable, to the general principle of competition upon merit for entrance to the service. In framing the first Civil Service rules, however, in 1883, the president, yielding to the pressure of the heads of some of the departments, and against the urgent protest of the Civil Service Commission, excepted from the requirement of examination large numbers of positions in the higher grades of the service, chiefly fiduciary and administrative positions such as cashiers, chief clerks, and chiefs of division. These positions being thus continued under the absolute control of the appointing officer, the effect of their exception from examination was to retain just that much of the old or "spoils" system within the nominal jurisdiction of the new or "merit" system. Even more: under the old system, while appointments from the outside had been made regardless of fitness, still those appointments had been made in the lower grades, the higher positions being filled by promotion within the service, usually of the most competent, but under the new system with its exceptions, while appointments to the lower grades were filled on the basis of merit, the pressure for spoils at each change of administration forced inexperienced, political, or personal favourites in at the top. This blocked promotions and demoralized the service. Thus, while the general effect of the Act was to limit very greatly the number of vicious appointments, at the same time the effect of these exceptions was to confine them to the upper grades, where the demoralizing effect of each upon the service would be a maximum. By constant efforts the Civil Service Commission succeeded in having position after position withdrawn from this excepted class, until by the action of the president, on 6th May 1896, it was finally reduced almost to a minimum. By subsequent presidential action, however, on 29th May 1899, the excepted class was again greatly extended.[2]

A further obstacle to the complete success of the merit system, and one which prevents the carrying forward of the reform to the extent to which it has been carried in Great Britain, is inherent in the Civil Service Act itself. All postmasters who receive compensation of $1000 or more per annum, and all collectors of customs and collectors of internal revenue, are appointed by the president and confirmed by the Senate, and are therefore, by express provision of the Act, not "required to be classified." The universal practice of treating these offices as political agencies, instead of as administrative business offices, is therefore not limited by the Act. Such officers are active in political work throughout the country, and their official position adds greatly to their power to affect the political prospects of the leaders in their districts. Accordingly the Senate, from being, as originally intended, merely a confirming body as to these officers, has become in a large measure, actually if not formally, a nominating body, and holds with tenacity to the power thus acquired by the individual senators. Thorough Civil Service reform requires that these positions also, as well as those of fourth-class postmasters (which are already classifiable under the Act), be made subject to the merit system, for in them is the real remaining stronghold of the spoils system. Even though all their subordinates be appointed through examination, it will be impossible to carry the reform to ultimate and complete success so long as the officers in charge are appointed mainly for political reasons and are changed with every change of administration.

The purpose of the Act to protect the individual employees in the service from the rapacity of the "political barons" has been measurably, if not completely, successful. The power given the Civil Service Commission, to investigate and report upon violations of the law, has been used to bring to light such abuses as the levying of political contributions, and to set the machinery of the law in motion against them. While comparatively few actual prosecutions have been brought about, and although the penalties imposed by the Act for this offence have been but seldom inflicted, still the publicity given to all such cases by the commission's investigations has had a wholesome deterrent effect. Before the passage of the Act, positions were as a general rule held upon a well-understood lease-tenure, the political contributions for them being as securely and as certainly collected as any rent. Now, however, it can be said that these forced contributions have almost entirely disappeared. The efforts which are still made to collect political funds from government employees in evasion of the law are limited in the main to persuasion to make "voluntary" contributions, and it has been possible so to limit and obstruct these efforts that their practical effect upon the character of the service is now very small.

**State examinations.**

The same evils that the Federal Civil Service Act was designed to remedy exist to a large degree in many of the state governments, and are especially aggravated in the administration of the local governments of some of the larger cities. The chief, if not the only, test of fitness for office in many cases has been party loyalty, honesty and capacity being seldom

[1] For details justifying these statements, see *U.S. Civil Service Commission's Fourteenth Report*, pp. 12–14.

[2] For the scope of these exceptions, see Civil Service Rule VI., at p. 57 of the *U.S. Civil Service Commission's Fifteenth and Sixteenth Reports*. A statement of the number of positions actually affected by this action of the president appears in the *Seventeenth Report*.

more than secondary considerations. The result has been the fostering of dishonesty and extravagance, which have brought weakness and gross corruption into the administration of the local governments. In consequence of this there has been a constantly growing tendency, among the more intelligent class of citizens, to demand that honest business methods be applied to local public service, and that appointments be made on the basis of intelligence and capacity, rather than of party allegiance. The movement for the reform of the civil service of cities is going hand in hand with the movement for general municipal reform, those reformers regarding the merit system of appointments as not merely the necessary and only safe bulwark to preserve the results of their labours, but also as the most efficient means for bringing about other reforms. Hence Civil Service Reform has been given a leading position in all programmes for the reform of state and municipal governments in recent years. This has undoubtedly been due, in the first instance, at least, to the success which attended the application of the merit system to the Federal service, municipal and state legislation following in the wake of the national civil service law. In New York an Act similar to the Federal Civil Service Act was passed on 4th May 1883, and in 1894 the principles of the merit system were introduced by an amendment into the State Constitution, and made applicable to cities and villages as well. In Massachusetts an Act was passed on 3rd June 1884, which in its general features was based upon the Federal Act and the New York Act. Similar laws were passed in Illinois and Wisconsin in 1895, applying both to the state governments and to the city governments of Chicago, Milwaukee, and several other cities. In New Orleans, La., and in Seattle, Wash., the merit system was introduced by an amendment to the city charter in 1896. The same result was accomplished by New Haven, Conn., in 1897, and by San Francisco, Cal., in 1899. In still other cities the principles of the merit system have been enacted into law, in some cases applying to the entire service and in others to only a part of it.

The application of the merit system to state and municipal governments has proved successful wherever it has been given a fair trial.[1] As experience has fostered public confidence in the system, and at the same time shown those features of the law which are most vulnerable, and the best means for fortifying them, numerous and important improvements upon the pioneer Act applying to the Federal service have been introduced in the more recent legislation. This is particularly true of the Acts now in force in New York (passed in 1899) and in Chicago. The power of the commission to enforce these Acts is materially greater than the power possessed by the Federal Commission. In making investigations they are not confined to taking the testimony of voluntary witnesses, but may administer oaths, and compel testimony and the production of books and papers where necessary; and in taking action they are not confined to the making of a report of the findings in their investigations, but may themselves, in many cases, take final judicial action. Further than this, the payment of salaries is made dependent upon the certificate of the commission that the appointments of the recipients were made in accordance with the civil service law and rules. Thus these commissions have absolute power to prevent irregular or illegal appointments by refractory appointing officers. Their powers being so much greater than those of the national commission, their action can be much more drastic in most cases, and they can go more directly to the heart of an existing abuse, and apply more quickly and effectually the needed remedy.

Upon the termination of the Spanish-American war, the necessity for the extension of the principles of the merit system to the new territories, the responsibility for whose government the results of this war had thrown upon the United States, was realized.[2] By the acts providing for civil government in Porto Rico (12th April 1900) and Hawaii (30th April 1900), the provisions of the Civil Service Act and Rules were applied to those islands. Under this legislation the classification applies to all positions which are analogous to positions in the Federal service, those which correspond to positions in the municipal and state governments being considered as local in character, and not included in the classification.

On 19th September 1900 the United States Philippine Commission passed an Act "for the establishment and maintenance of an efficient and honest civil service in the Philippine Islands." This Act, in its general features, is based upon the national civil service law, but includes also a number of the stronger points to be found in the state and municipal laws mentioned above. Among these are the power given the Civil Service Board to administer oaths, summon witnesses, and require the production of official records; and the power to stop payment of salaries to persons illegally appointed. Promotions are to be determined by competitive examinations, and are to be made throughout the service, as there are no excepted positions. A just right of preference in local appointments is given to natives. The president of the Philippine Commission in introducing this bill said: "The purpose of the United States Government . . . in these islands is to secure for the Filipino people as honest and as efficient a government as may be possible. . . . It is the hope of the commission to make it possible for one entering the lowest ranks to reach the highest, under a tenure based solely upon merit." It is too early as yet to give positive testimony as to its actual operation, but judging by past experience it is believed that this law is well adapted to accomplish the purpose above stated.

For fuller information upon the details of the present workings of the merit system in the Federal service, recourse should be had to the publications of the U.S. Civil Service Commission, which are to be found in the public libraries in all the principal cities in the United States, or which may be had free of charge upon application to the commission. The *Manual of Examinations*, published semi-annually, gives full information as to the character of the examinations held by the commission, together with the schedule of dates and places for the holding of those examinations. The *Annual Reports* of the commission contain full statistics of the results of its work, together with comprehensive statements as to the difficulties encountered in enforcing the law, and the means used to overcome them. In the *Fifteenth Report*, pp. 443–485, will be found a very valuable historical compilation from original sources, upon the "practice of the presidents in appointments and removals in the Executive Civil Service, from 1789 to 1883." In the same report, pp. 511–517, is a somewhat comprehensive bibliography of "civil service" in periodical literature in the 19th century, brought down to the end of 1898. (J. R. P.)

**Civita Castellana,** a town and episcopal see of Italy, province of Rome, 49 miles north from Rome by rail. In 1887 remains of an Etruscan temple, and also the remains of a temple attributed to Juno Quiritis, were

[1] In the *U.S. Civil Service Commission's Fifteenth Report*, pp. 489–502, the "growth of the civil service reform in states and cities" is historically treated, briefly, but with some thoroughness.

[2] See *U.S. Civil Service Commission's Fifteenth Report*, p. 37 and pp. 521–559, in which the application of civil service reform principles to colonial governments was discussed in connexion with a review of the experience of Great Britain and Holland in this regard.

discovered here. Six miles to the south-east is the Mount Soracte of Horace (*Carm.* i. 9) and Virgil (*Æn.* xi. 785). Population, about 4500.

**Civitavecchia,** a seaport town and episcopal see of Italy, province of Rome, on the west coast, 50 miles north-west from Rome by rail. It is the port of Rome; the harbour has been deepened, though only in part, to 21 feet; the northern entrance was deepened to 26¼ feet in 1899–1900. A new quay was completed in 1895, a new breakwater begun in 1900, and other improvements have been effected since 1887. There are shipbuilding yards, blast furnaces, cement and patent fuel factories, and an arsenal, a cathedral, a theatre, and on the south mole a citadel built to the plans of Michel Angelo. The port is cleared by some 1610 vessels of 410,550 tons annually (1233 of 455,000 tons in 1899). Alum is extensively mined. This town supplies Rome with a large portion of its fish. Population, about 14,000.

**Clackmannanshire,** the smallest county in Scotland, bounded on the N. by Perthshire, on the E. by Perth and Fife shires, on the S.W. by the Forth, and on the W. by Stirling and Perth shires.

*Area and Population.*—In 1891 the Stirling part of the parish of Alva was transferred to Clackmannan, and the Clackmannan part of the parishes of Stirling and Logie to Stirling. The area of the county (exclusive of foreshore) as officially estimated is 35,160 acres, or about 55 square miles. The population was in 1881, 25,677; in 1891, 28,432; in 1891, on the above area, 33,140, of whom 15,834 were males and 17,306 females; in 1901 it was 32,019. On the old area, taking land only (30,477 acres, or 47·6 square miles), the number of persons to the square mile in 1891 was 605, and the number of acres to the person 1·1. In the registration county the population increased between 1881 and 1891 by 9·8 per cent. Between 1881 and 1891 the excess of births over deaths was 3495, and the increase of the resident population was 2975. The following table gives particulars of births, deaths, and marriages in 1880, 1890, and 1899:—

| Year. | Deaths. | Marriages. | Births. | Percentage of Illegitimate. |
|---|---|---|---|---|
| 1880 | 417 | 138 | 820 | 8·1 |
| 1890 | 456 | 154 | 784 | 5·10 |
| 1899 | 560 | 178 | 786 | 3·6 |

The birth-rate, death-rate, and marriage-rate are all below the rates for Scotland. The following table gives the birth-rate, death-rate, and marriage-rate per thousand of the population for a series of years:—

| | 1880. | 1881-90. | 1890. | 1891-98. | 1899. |
|---|---|---|---|---|---|
| Birth-rate . . | 34·32 | 30·90 | 29·57 | 26·40 | 22·02 |
| Death-rate . . | 17·45 | 17·12 | 17·20 | 15·17 | 15·69 |
| Marriage-rate . | 5·77 | 5·65 | 5·80 | 5·63 | 4·98 |

In 1891 there were 215 Gaelic-speaking persons in the county, and 89 foreigners. Valuation in 1889–90, £137,084; 1899–1900, £165,706.

*Administration.*—The county unites with Kinross-shire to return a member to parliament. Clackmannan is the county town, but Alloa (11,417), Alva (4624), and Tillicoultry (3337), which are police burghs, take precedence in population and trade. There are 5 parishes, all but one of which belong to the Stirling Combination. In September 1899 the number of paupers and dependants was 556. Clackmannan forms a sheriffdom with Stirling and Dumbarton shires, and a sheriff-substitute sits at Alloa.

*Education.*—Six school boards manage 16 schools, which had an average attendance of 5334 in 1898–99, while 3 voluntary schools (one Episcopal and one Roman Catholic) had 437. There is a famous endowed secondary school, the Institution, at Dollar, and three other schools in the county earned grants in 1898 for giving higher education. A large part of the "residue" grant is spent in subsidizing Dollar Institution and science and art classes in the burghs.

*Agriculture.*—The Ochil hills in the north afford excellent pasturage. Farming is high, and is mixed pastoral and arable. In 1898, 44·5 per cent. of the area was under cultivation, the county ranking thirteenth in this regard in Scotland. In 1895 the average size of the 197 holdings in the county was 80 acres. The percentage under 5 acres was 21·32; between 5 and 50 acres, 34·52; and above 50 acres, 44·16. There were 22 between 50 and 100, 56 between 100 and 300, and 9 between 300 and 500 acres. In 1895, 3026 acres were under wood. Oats are the principal corn crop, and wheat and barley cover about equal acreages. The following table gives the principal acreages at intervals of five years from 1880:—

| Year. | Area under Crops. | Corn Crops. | Green Crops. | Clover. | Permanent Pasture. | Fallow |
|---|---|---|---|---|---|---|
| 1880 | 15,691 | 5772 | 1479 | 3171 | 4926 | 343 |
| 1885 | 15,858 | 5278 | 1358 | 3530 | 5392 | 300 |
| 1890 | 15,857 | 4829 | 1219 | 4459 | 5102 | 234 |
| 1895 | 15,687 | 4703 | 1244 | 3345 | 6149 | 236 |
| 1899 | 16,567 | 4265 | 1146 | 3474 | 6569 | 189 |

The following table gives particulars of the live stock during the same years:—

| Year | Total Horses. | Total Cattle. | Cows or Heifers in Milk or Calf | Sheep. | Pigs. |
|---|---|---|---|---|---|
| 1880 | 694 | 3383 | 1349 | 10,399 | 1473 |
| 1885 | 690 | 3902 | 1499 | 9,749 | 1980 |
| 1890 | 644 | 3930 | 1503 | 10,656 | 1772 |
| 1895 | 687 | 4042 | 1630 | 12,692 | 2985 |
| 1899 | 699 | 3686 | 1522 | 14,446 | 1729 |

*Industries and Trade.*—Paper-making has been added to the industries, of which coal-mining is the most important. 402,733 tons of coal, valued at £140,956, were raised in 1890; 366,697 tons, valued at £137,511, in 1899. 7097 tons of sandstone were obtained in 1895, and 15,605 tons, valued at £5416, in 1899. Alloa is the only fishing port in the county.

(W. WA.)

**Clacton-on-Sea,** a seaside town and flourishing watering-place of Essex, England, 16 miles south-east of Colchester by rail, in the Harwich parliamentary division. A Franciscan convent, a higher middle-class day school in connexion with it, a board school, two convalescent homes, a "holiday" home, and a town-hall (£20,000) have been recently erected; and modern improvements include a pier (1873) 1150 feet long, a sea-wall (1880), a promenade 1¼ mile long, and a marine parade (1896). A drainage system was effected in 1894. Area of urban district, 4074 acres; population (1891), 3584; (1901), 7453.

**Clanvowe, Sir Thomas** (14th and 15th centuries), is a name which was first mentioned in the history of English literature by William Morris in 1895, when, in editing the text of *The Cuckoo and the Nightingale* for the Kelmscott Press, he stated that Professor Skeat had discovered that at the end of the best of the MSS. the author was called Clanvowe. In 1897 this information was confirmed and expanded by Professor Skeat himself in the supplementary volume of his Oxford Chaucer (1894–1897). The beautiful romance of *The Cuckoo and the Nightingale* was published by Thynne in 1532, and was attributed by him, and by successive editors down to the days of Henry Bradshaw, to Chaucer. It was due to this error that for three centuries Chaucer was supposed to be identified with the manor of Woodstock, and even painted, in fanciful pictures, as lying

> Under a maple that is fair and green,
> Before the chamber-window of the Queen
> At Wodëstock, upon the greenë lea.

But this queen could only be Joan of Navarre, who arrived in 1403, three years after Chaucer's death, and it is to the spring of that year that Professor Skeat attributes the composition of the poem. Sir Thomas Clanvowe was of a Herefordshire family, settled near Wigmore. He was a prominent figure in the courts of

Richard II. and Henry IV., and was one of those who "had begun to mell of Lollardy, and drink the gall of heresy." The date of his birth is unknown, and his name is last mentioned in 1404. The historic and literary importance of *The Cuckoo and the Nightingale* is great. It is the work of a poet who had studied the prosody of Chaucer with more intelligent care than either Occleve or Lydgate, and who therefore forms an important link between the 14th and 15th centuries in English poetry. Clanvowe writes with a surprising delicacy and sweetness, in a five-line measure almost peculiar to himself. Professor Skeat points out a unique characteristic of Clanvowe's versification, namely, the unprecedented freedom with which he employs the suffix of the final *-e*, and rather avoids than seeks elision. *The Cuckoo and the Nightingale* was imitated by Milton in his sonnet to the Nightingale, and was rewritten in modern English by Wordsworth. It is a poem of so much individual beauty, that we must regret the apparent loss of everything else written by a poet of such unusual talent. (E. G.)

**Clare,** a maritime county of Ireland, province of Munster.

*Population.*—The area of the administrative county in 1900 was 784,956 acres, of which 145,959 were tillage, 478,411 pasture, 243 fallow, 7840 plantation, 28,312 turf-bog, 8098 marsh, 79,432 barren mountain, and 36,661 water, roads, fences, &c. The new administrative county under the Local Government (Ireland) Act, 1898, includes 3 electoral divisions, formerly situated in Galway. The population in 1881 was 141,457, and in 1891, 124,483, of whom 63,138 were males and 61,345 females, divided as follows among the different religions:—Roman Catholics, 122,047; Protestant Episcopalians, 2246; Presbyterians, 106; Methodists, 53; and other denominations, 31. The decrease of population between 1881 and 1891 was 12·00 per cent. The average number of persons to an acre was ·15. Of the total population, 114,928 inhabited the rural districts, being an average of 123 persons to each square mile of crops and pasture. The population in 1901 was 112,129 (Roman Catholics, 109,899; Protestant Episcopalians, 2007; Presbyterians, 151; Methodists, 45; others, 27), being a decrease of 11·2 per cent. The following table gives the degree of education in 1891:—

| | Males. | Females. | Total. | Percentage. | | |
|---|---|---|---|---|---|---|
| | | | | R C. | Pr. Epis. | Presb. |
| Read and write | 42,052 | 38,820 | 80,872 | 71·8 | 93·9 | 92·2 |
| Read only . . | 4,578 | 4,977 | 9,555 | 8 7 | 2·7 | 3·3 |
| Illiterate . . . | 10,083 | 11,391 | 21,474 | 19 5 | 3·4 | 4·5 |

In 1881 the percentage of illiterates among Roman Catholics was 27·8. In 1891 there were 4 superior schools with 253 pupils (all Roman Catholics), and 250 primary schools with 20,549 pupils (Roman Catholics 20,228, and Protestants 321). The number of pupils on the rolls of the national schools on 30th September 1899 was 22,967, of whom 22,693 were Roman Catholics and 274 Protestants. The following table gives the number of births, deaths, and marriages in various years:—

| Year. | Births. | Deaths. | Marriages. |
|---|---|---|---|
| 1881 | 2981 | 1899 | 370 |
| 1891 | 2566 | 1851 | 453 |
| 1899 | 2333 | 1694 | 378 |

In 1899 the birth-rate per 1000 was 18·5, and the death-rate was 13·4; the rate of illegitimacy was 1·6 per cent. of the total births. The total number of emigrants who left the county between 1st May 1851 and 31st December 1899 was 149,084, of whom 72,984 were males and 76,100 females. The following are the chief towns in the county, with their populations in 1891: Ennis, 5460; Kilrush, 4095; Kilkee, 1556.

*Administration.*—The county is divided into two parliamentary divisions, East and West, the number of registered electors in 1900 being respectively 12,028, and 10,683. The rateable value in 1900 was £323,998. By the Local Government (Ireland) Act, 1898, the fiscal and administrative duties of the grand jury and (to a less extent) of other bodies were transferred to a county council, urban and rural district councils were established, and under that Act the county now comprises 2 urban and 9 rural sanitary districts.

*Agriculture.*—The following tables show the acreage under crops, including meadow and clover, and the amount of live stock in 1881, 1891, 1895, and 1900. The figures for 1900 are for the new administrative county:—

| | Wheat | Oats. | Barley, Rye, Beans | Potatoes. | Turnips. | Other Green Crops. | Meadow and Clover | Total |
|---|---|---|---|---|---|---|---|---|
| 1881 | 2597 | 16,215 | 2391 | 25,681 | 5654 | [illegible] | [illegible] | [illegible] |
| 1891 | 2025 | 13,100 | 1652 | 20,665 | 5410 | [illegible] | [illegible] | [illegible] |
| 1895 | 836 | 12,765 | 1633 | 20,547 | 5571 | 5315 | [illegible] | [illegible] |
| 1900 | 1253 | 11,103 | 1541 | 18,504 | 4846 | 5770 | 102,852 | [illegible] |

For 1899 the total value of the cereal and other crops was estimated by the Registrar-General at £968,331. The number of acres under pasture in 1881 was 475,316; in 1891, 463,061, and in 1900, 478,411.

| | Horses and Mules. | Asses | Cattle. | Sheep. | Pigs. | Goats. | Poultry |
|---|---|---|---|---|---|---|---|
| 1881 | 15,960 | 9,596 | 156,153 | 108,121 | 41,847 | 14,994 | 423,072 |
| 1891 | 19,070 | 10,649 | 173,282 | 141,399 | 38,290 | 17,382 | 409,098 |
| 1895 | 20,615 | 11,312 | 171,288 | 118,065 | 41,491 | 17,721 | 429,274 |
| 1900 | 18,057 | 12,092 | 175,756 | 117,864 | 43,439 | 18,038 | 455,867 |

The number of milch cows in 1891 was 45,224, and in 1900, 55,351. It is estimated that the total value of cattle, sheep, and pigs in 1899 was £2,390,014. In 1900 the number of holdings not exceeding 1 acre was 1584; between 1 and 5, 1347; between 5 and 15, [illegible]; between 15 and 30, 4753; between 30 and 50, 3676; between 50 and 100, 2799; between 100 and 200, 939; between 200 and 500, 353; and above 500, 55—total, 18,792. The number of loans issued (the number of loans being the same as the number of tenants) under the Land Purchase Acts, 1885, 1891, and 1896, up to 31st March 1900, was 463, amounting to £127,912. The number of loans sanctioned for agricultural improvements under sect. 31 of the Land Act, 1881, between 1882 and 1900, was 778, and the amount issued was £54,034. The total amount issued on loan for all classes of works under the Land Improvement Acts, from the commencement of operations in 1847 to 31st March 1900, was £177,819. (W. H. Po)

**Claremont,** a town of Sullivan county, New Hampshire, U.S.A. It is situated in the western part of the state, bordering on Connecticut river, and contains several villages, the principal among them being Claremont, Claremont Junction, and West Claremont. It is traversed by the Boston and Maine Railway. Population (1880), 4704; (1900), 6498.

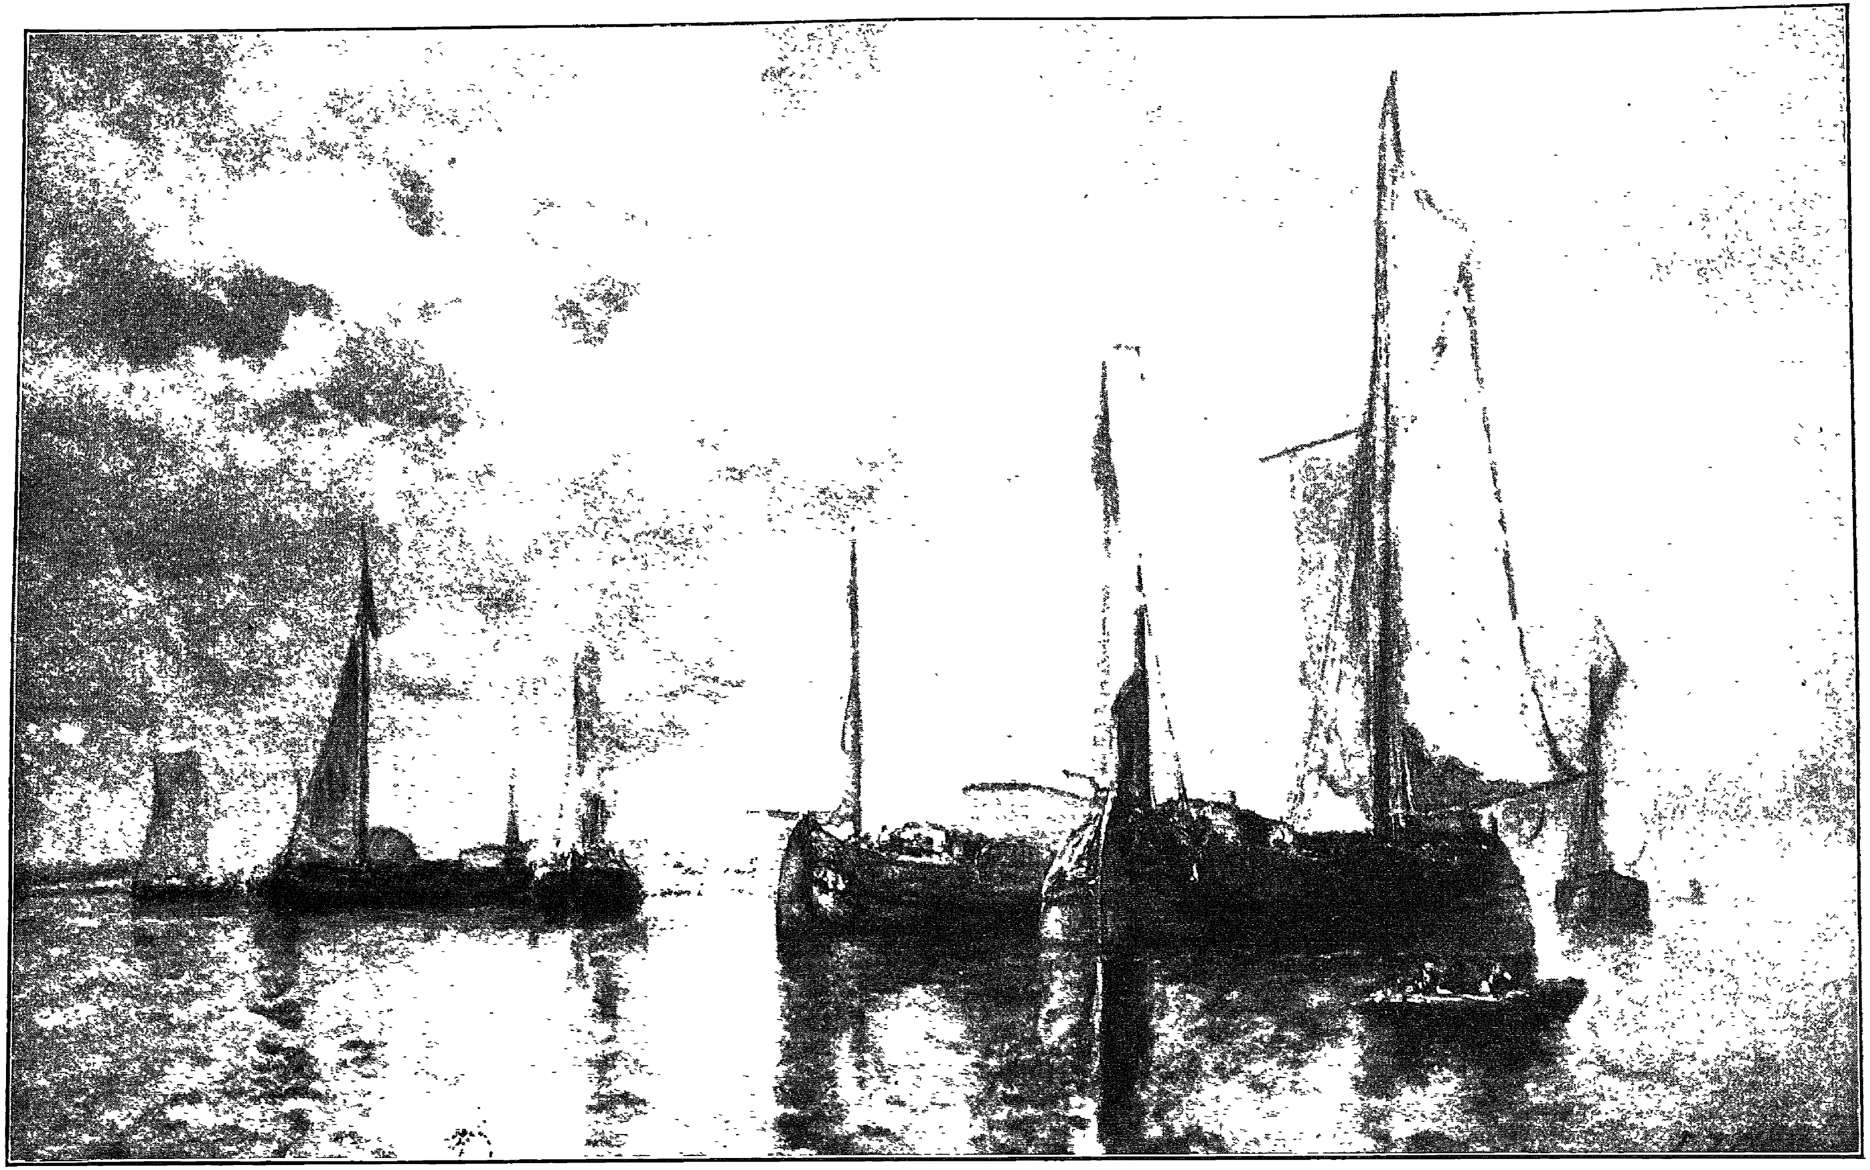
**Clark, Sir Andrew,** 1st Bart. (1826–1893), British physician, was born at Aberdeen on 28th October 1826. His father, who also was a medical man, died when he was only a few years old. After attending school in Aberdeen, he was sent by his guardians to Dundee and apprenticed to a druggist; then returning to Aberdeen he began his medical studies in the university of that city. Soon, however, he went to Edinburgh, where in the extra-academical school he had a student's career of the most brilliant description, ultimately becoming assistant to Dr Hughes Bennett in the Pathological Department of the Royal Infirmary, and assistant demonstrator of anatomy to Dr Robert Knox. But symptoms of pulmonary phthisis brought his academic life to a close, and in the hope that the sea might benefit his health he joined the medical department of the navy in 1848. Next year he became pathologist to the Haslar Hospital, where Huxley was one of his colleagues, and in 1853 he was the successful candidate for the newly-instituted post of curator to the museum of the London Hospital. Here he intended to devote all his energies to pathology, but circumstances brought him into active medical practice. In 1854, the year in which he took his doctor's degree at Aberdeen, the post of assistant physician to the Hospital became vacant and he was prevailed upon to apply for it. He was fond of telling how his phthisical tendencies gained him the appointment. "He is only a poor Scotch doctor," it was said, "with but a few months to live; let him have it." He had it, and two years before his death publicly declared

that of those who were on the staff of the Hospital at the time of his selection he was the only one remaining alive. In 1854 he became a member of the College of Physicians, and in 1858 a fellow, and then went in succession through all the offices of honour the College has to offer, ending in 1888 with the presidency, which he continued to hold till his death. From the time of his selection as assistant physician to the London Hospital, his fame rapidly grew until he became a fashionable doctor with one of the largest practices in London, counting among his patients some of the most distinguished men of the day. The great number of persons who passed through his consulting-room every morning rendered it inevitable that to a large extent his advice should become stereotyped and his prescriptions often reduced to mere stock formulæ, but in really serious cases he was not to be surpassed in the skill and carefulness of his diagnosis and in his attention to detail. In spite of the claims of his practice he found time to produce a good many books, all written in the precise and polished style on which he used to pride himself. Doubtless owing largely to personal reasons, lung diseases and especially fibroid phthisis formed his favourite theme, but he also discussed other subjects, such as renal inadequacy, anæmia, constipation, &c. He died in London on 6th November 1893, after a paralytic stroke which was probably the result of persistent overwork.

**Clarke, Sir Andrew** (1824–1902), British soldier and administrator, son of Colonel Andrew Clarke, of County Donegal, governor of West Australia, was born at Southsea, England, on 27th July 1824, and educated at King's School, Canterbury. He entered the R.M.A., Woolwich, and obtained his commission in the army in 1844 as second lieutenant in the Royal Engineers. He was appointed to his father's staff in West Australia, but was transferred to be A.D.C. and military secretary to the Governor of Tasmania; and in 1847 he went to New Zealand to take part in the Maori war, and for some years served on Sir George Grey's staff. He was then made Surveyor-General in Victoria, took a prominent part in framing its new Constitution, and held the office of Minister of Public Lands during the first administration (1855–57). He returned to England in 1857, and in 1863 was sent on a special mission to the West Coast of Africa. In 1864 he was appointed Director of Works for the Navy, and held this post for nine years, being responsible for great improvements in the naval arsenals at Chatham, Portsmouth, and Plymouth, and for fortifications at Malta, Cork, Bermuda, and elsewhere. In 1873 he was made K.C.M.G., and became Governor of the Straits Settlements, where he did most valuable work in consolidating British rule and ameliorating the condition of the people. From 1875 to 1880 he was Minister of Public Works in India; and on his return to England in 1881, holding then the rank of lieutenant-colonel in the army, he was first appointed commandant at Chatham and then Inspector-General of Fortifications (1882–86). Having attained the rank of lieutenant-general and been created G.C.M.G., he retired from official life, and in 1886 and 1893 unsuccessfully stood for Parliament as a supporter of Mr Gladstone. During his last years he was Agent-General for Victoria. He died 29th March 1902. Both as a technical and strategical engineer, and as an Imperial administrator, Sir Andrew Clarke was one of the ablest and most useful public servants of his time; and his contributions to periodical literature, as well as his official memoranda, contained valuable suggestions on the subjects of Imperial defence and Imperial consolidation, which received too little consideration at a period when the Home Governments were not properly alive to their importance. He is entitled to remembrance as one of those who first inculcated, from a wide practical experience, the views of Imperial administration and its responsibilities which in his last years he saw accepted by the bulk of his countrymen. (H. CH.)

**Clarke, James Freeman** (1810–1888), American preacher and author, was born in Hanover, N.H., on 4th April 1810. He was of a family which runs back, as he supposed, to the captain of the *Mayflower*. He was prepared for college at the Public Latin School of Boston, and after four years in Harvard College took his first degree in 1829. In his class were S. F. Smith, the author of the American National Hymn, and Oliver Wendell Holmes. After three years more of study at Cambridge Clarke was ordained as minister of a Unitarian congregation at Louisville, Kentucky, which was then a slave state. From the beginning, therefore, Clarke watched the institution of slavery, and he threw himself heart and soul into the national movement for its abolition. At the end of seven years he returned to Boston, where he and his friends established the "Church of the Disciples." It brought together a body of men and women active and eager in applying the Christian religion to the social problems of the day; and he would have said that the feature which distinguished it from any other church was that they also were ministers of the highest religious life. Ordination could make no distinction between him and them. For fifty years from the beginning of his active life until his death he wrote freely for the press. With Eliot of St Louis, and James Perkins of Cincinnati, he established and carried on a magazine called the *Western Messenger*. Its business was to carry to readers in the Mississippi valley simple statements of "liberal religion," involving what were then the most radical appeals as to national duty, especially the abolition of slavery. The magazine is now of value to collectors because it contains the earliest printed poems of Ralph Waldo Emerson, who was Clarke's personal friend. Most of Clarke's earlier published writings were addressed to the immediate need of establishing a larger theory of religion than that espoused by people who were still trying to be Calvinists, people who maintained what a good American phrase calls "hard-shelled churches." But it would be wrong to call his work controversial. He was always declaring that the business of the Church is Eirenic and not Polemic. Such books as the *Truth and Errors of Orthodoxy* have been read more largely by members of orthodox churches than by Unitarians. In the great moral questions of the time Clarke was a fearless and practical advocate of the broadest statement of human rights. Without caring much what company he served in, he could always be seen and heard, a leader of unflinching courage in the front rank of the battle. He published but few verses, but at bottom he was a poet. He was a diligent and accurate scholar, and among the books by which he is best known in America is one called *The Ten Great Religions of the World*. Few men in the United States have done more than Clarke to give breadth to the published discussion of the subjects of literature, ethics, and religious philosophy. He died at Jamaica Plain, Mass., on 8th June 1888. His Life—compiled mainly from his autobiography, letters, and diaries—was published in Boston in 1892. (E. E. H.)

**Clarksville**, capital of Montgomery county, Tennessee, U.S.A., situated in the northern part of the state, at an altitude of 394 feet, on Cumberland river, at the mouth of Red river, and on the Louisville and Nashville Railway. The Cumberland is navigable at this point. Clarksville is one of the greatest tobacco markets, being in a region largely devoted to the culture of the plant. It



"Calm on the Scheldt." By P. J. Clays.

is the seat of the South-West Presbyterian University. Population (1880), 3880; (1890), 7924; (1900), 9431.

**Clausius, Rudolf Julius Emmanuel** (1822–1888), German physicist, was born on 2nd January 1822 at Koslin, in Pomerania. After attending the Gymnasium at Stettin, he studied at Berlin University from 1840 to 1844. In 1848 he took his degree at Halle, and in 1850 was appointed professor of physics in the Royal Artillery and Engineering School at Berlin. Late in the same year he delivered his inaugural lecture as *privat docent* in the University. In 1855 he became an ordinary professor at Zürich Polytechnic, accepting at the same time a professorship in the University of Zurich. In 1867 he moved to Würzburg as professor of physics, and two years later was appointed to the same chair at Bonn, where he died on 24th August 1888. During the Franco-German war he was at the head of an ambulance corps composed of Bonn students, and received the Iron Cross for the services he rendered at Vionville and Gravelotte. The work of Clausius, who was a mathematical rather than an experimental physicist, was concerned with many of the most abstruse problems of molecular physics. By his restatement of Carnot's principle he put the theory of heat on a truer and sounder basis, and he deserves the credit of having made thermo-dynamics a science; he enunciated the second law, in a paper contributed to the Berlin Academy in 1850, in the well-known form, "Heat cannot of itself pass from a colder to a hotter body." His results he applied to an exhaustive development of the theory of the steam-engine, laying stress in particular on the conception of entropy. The kinetic theory of gases owes much to his labours, Clerk Maxwell calling him its principal founder. It was he who raised it, on the basis of the dynamical theory of heat, to the level of a theory, and he carried out many numerical determinations in connexion with it, *e.g.*, of the mean free path of a molecule. To Clausius also was due an important advance in the theory of electrolysis, for he put forward the idea that molecules in electrolytes are continually interchanging atoms, the electric force not causing, but merely directing, the interchange. This view found little favour until 1887, when it was taken up by Arrhenius, who adduced additional arguments in its support, and formed from it the hypothesis of electrolytic dissociation now widely accepted.

**Clay, Charles** (1801–1893), English surgeon, was born at Bredbury, near Stockport, on 27th December 1801. He began his medical education as a pupil of Mr Kinder Wood in Manchester (where he used to attend Dalton's lectures on chemistry), and in 1821 went to Edinburgh to continue his studies there. Qualifying in 1823, he began a general practice in Ashton-under-Lyne, but in 1839 removed to Manchester to practise as an operative and consulting surgeon. It was there that, in 1842, he first performed the operation of ovariotomy with which his name is associated. On this occasion it was perfectly successful, and when fifteen years afterwards he published an analysis of his cases he was able to show a mortality only slightly above 25 per cent. Although his merits in this matter have sometimes been denied, his claim to the title "Father of Ovariotomy" is now generally conceded, and it is admitted that he deserves the credit not only of having shown how that operation could be made a success, but also of having played an important part in the advance of abdominal surgery for which last century was conspicuous. In spite of the claims of a heavy practice, Clay found time for the pursuit of geology and archæology. Among the books of which he was the author were a volume of *Geological Sketches of Manchester* and a *History of the Currency of the Isle of Man*, and his collections included over a thousand editions of the Old and New Testaments, and a remarkably complete series of the silver and copper coins of the United States of America. He died at Poulton-le-Fylde, near Preston, on 19th September 1893.

**Clay Cross,** a town in the Chesterfield division of Derbyshire, England, 5 miles south from Chesterfield, with a station on the Midland Railway. Since 1894 it has been governed by an urban district council. The Clay Cross Colliery and Ironworks Company employ a great number of hands. Population (1891), 7727; (1901), 8348.

**Clay, Frederic** (1840–1889), English musical composer, was born in Paris in 1840. He studied music under Molique in Paris, and Hauptmann at Leipzig. With the exception of a few songs and two cantatas, *The Knights of the Cross* (1866) and *Lalla Rookh* (1877), his compositions were all written for the stage; but he will be best remembered as the composer of "I'll sing thee songs of Araby." Clay's first public appearance was made with an opera entitled *Court and Cottage*, the libretto of which was written by Tom Taylor. This was produced at Covent Garden in 1862, and was followed by *Constance* (1865), *Ages Ago* (1869), and *Princess Toto* (1875), to name only three of many works which have long since been forgotten. The last two, which were written to libretti by W. S. Gilbert, are among Clay's most tuneful and most attractive works. He wrote part of the music for *Babil and Bijou* (1872), and *The Black Crook* (1873), both of which were produced at the Alhambra. He also furnished incidental music for a revival of *Twelfth Night*, and for the production of James Albery's *Oriana*. His last works, *The Merry Duchess* (1883), and *The Golden Ring* (1883), the latter written for the reopening of the Alhambra, which had been burned to the ground the year before, showed an advance upon his previous work, and rendered all the more regrettable the stroke of paralysis which crippled his physical and mental energies during the last few years of his life. He died at Great Marlow in 1889. (R. A. S.)

**Clays, Paul Jean** (1819–1900), Belgian artist, was born at Bruges in 1819, and died at Brussels in 1900. He was one of the most esteemed marine painters of his time, and early in his career he substituted a sincere study of nature for the extravagant and artificial conventionality of most of his predecessors. When he began to paint, the sea was considered by Continental artists as worth representing only under its most tempestuous aspects. Artists cared only for the stirring drama of storm and wreck, and they clung still to the old-world tradition of the romantic school. Clays was the first to appreciate the beauty of calm waters reflecting the slow procession of clouds, the glories of sunset illuminating the sails of ships or gilding the tarred sides of heavy fishing-boats. He painted the peaceful life of rivers, the poetry of wide estuaries, the regulated stir of roadsteads and ports. And while he thus broke away from old traditions he also threw off the trammels imposed on him by his master, the marine painter Gudin. Endeavouring only to give truthful expression to the nature that delighted his eyes, he sought to render the limpid salt atmosphere, the weight of waters, the transparence of moist horizons, the gem-like sparkle of the sky. A Fleming in his feeling for colour, he set his palette with clean strong hues, and their powerful harmonies were in striking contrast with the rusty, smoky tones then in favour. If he was not a "luminist" in the modern use of the word, he deserves at any rate to be classed with the founders of the modern naturalistic school. This conscientious and healthy interpretation, to which the artist remained faithful, without any important change,

to the end of an unusually long and laborious career, attracted those minds which aspired to be bold, and won over those which were moderate. Clays soon took his place among the most famous Belgian painters of his generation, and his pictures, sold at high prices, are to be seen in most public and private galleries. We may mention, among others, "The Beach at Ault," "Boats in a Dutch Port," and "Dutch Boats in the Flushing Roads," the last-named in the National Gallery of London. In the Brussels Gallery are "The Port of Antwerp," "Coast near Ostend," and a "Calm on the Scheldt"; in the Antwerp Museum, "The Meuse at Dordrecht"; in the Pinakothek at Munich, "The Open North Sea"; in the New York Gallery, "The Festival of the Freedom of the Scheldt at Antwerp in 1863"; in the palace of the king of the Belgians, "Arrival of Queen Victoria at Ostend in 1857"; in the Bruges Academy, "Port of Feirugudo, Portugal." P. J. Clays was a member of several Academies, Belgian and foreign, and of the Order of Leopold, the Legion of Honour, &c.

See CAMILLE LEMONNIER. *Histoire des Beaux Arts.* Brussels. 1887. (O. M*.)

**Clayton-le-Moors,** a township and parish of Lancashire, England, 2 miles north-north-west of Accrington by rail, in the Accrington parliamentary division. In 1894 the parish was placed under an urban district council of twelve members. Besides the church of All Saints, restored in 1882, the parish has a Roman Catholic church (1819), a Primitive Methodist (1858), a Wesleyan (1862), and a Baptist (1882) chapel; there are also five schools, one of them Roman Catholic. Other buildings are the district council offices, a mechanics' institute, and a fire-station. The industries comprise cotton mills, calico printing, engineering, soap, brick, and tile works. Area of urban district, 1059 acres; population (1881), 6695; (1901), 8153.

**Clearfield,** capital of Clearfield county, Pennsylvania, U.S.A., on the western branch of the Susquehanna river, and on the Pennsylvania, the Beech Creek, and the Buffalo, Rochester, and Pittsburg Railways. Population (1890), 2248; (1900), 5081.

**Cleator Moor,** a town in the Egremont parliamentary division of Cumberland, England, 2½ miles north of Egremont by rail. There are public offices, a market hall, and a free library. The staple industry is the working of coal mines and of iron-ore mines, in connexion with which there are four blast furnaces. Area of urban district, 2947 acres; population (1881), 10,420; (1901), 8121.

**Cleburne,** capital town of Johnson county, Texas, U.S.A., 25 miles south of Fort Worth, at the intersection of two branches of the Gulf, Colorado, and Santa Fé Railway. Population (1890), 3278; (1900), 7493.

**Cleckheaton,** a township and parish in the Spen Valley parliamentary division of the West Riding of Yorkshire, England, 12 miles by rail south-west of Leeds. There are a town hall, a hospital for infectious diseases, a mechanics' institute, and a technical school. A chamber of commerce has held meetings here since 1878. The industries comprise the manufacture of woollens, blankets, flannel, wire-card, and machinery. Area of urban district, 1755 acres; population (1881), 10,653; (1901), 12,523.

**Clémenceau, Georges** (1841——), French politician, was born at Mouilleron-en-Pareds, La Vendée, 28th September 1841. Having adopted medicine as his profession, for which he had been educated at Nantes and Paris, he settled in 1869 in Montmartre; and after the revolution of 1870 he had become sufficiently well known to be nominated mayor of the 18th arrondissement of Paris (Montmartre)—an unruly district over which it was a difficult task to preside. In February 1871 he was elected as a Radical to the National Assembly for the department of the Seine, and voted against the peace preliminaries. The execution, or rather murder, of Generals Lecomte and Clément Thomas by the communists on 18th March, which he vainly tried to prevent, brought him into collision with the Central Committee sitting at the Hôtel de Ville, and they ordered his arrest, but he escaped; he was accused, however, by various witnesses, at the subsequent trial of the murderers (29th November), of not having intervened when he might have done, and though he was cleared of this charge it led to a duel, for his share in which he was prosecuted and sentenced to a fine and a fortnight's imprisonment. Meanwhile, on 20th March 1871, he had introduced in the National Assembly at Versailles, on behalf of his Radical colleagues, the bill establishing a Paris Municipal Council of eighty members; but he was not returned himself at the elections of 26th March. He tried with the other Paris mayors to mediate between Versailles and the Hôtel de Ville, but failed, and accordingly resigned his mayoralty and his seat in the Assembly, and temporarily gave up politics; but he was elected to the Paris Municipal Council on 23rd July 1871 for the Clignancourt *quartier*, and retained his seat till 1876, passing through the offices of secretary and vice-president, and becoming president in 1875. In 1876 he stood again for the Chamber of Deputies, and was elected for the 18th arrondissement. He joined the Extreme Left, and his energy and mordant eloquence speedily made him the leader of the Radical section. In 1877, after the *Seize Mai* (see FRANCE, *History*), he was one of the republican majority who denounced the Broglie ministry, and he took a leading part in resisting the anti-republican policy of which the *Seize Mai* incident was a symptom, his demand in 1879 for the indictment of the Broglie ministry bringing him into particular prominence. In 1880 he started his newspaper, *La Justice*, which became the principal organ of Parisian Radicalism; and from this time onwards throughout M. Grévy's presidency his reputation as a political critic, and as a destroyer of ministries who yet would not take office himself, rapidly grew. He was an active opponent of M. Jules Ferry's colonial policy and of the Opportunist party, and in 1885 it was his use of the Tongking disaster which principally determined the fall of the Ferry Cabinet. At the elections of 1885 he advocated a strong Radical programme, and was returned both for his old seat in Paris and for the Var, selecting the latter. Refusing to form or enter a ministry, he supported the Right in keeping M. Freycinet in power in 1886, and was responsible for the inclusion of General Boulanger in the Freycinet Cabinet as war minister. Boulanger, depending on the Radicals, and supported by them, inaugurated his career by measures congenial to them, but when he began to assert himself and to take advantage of Grévy's unpopularity to pose as a Pretender, with the help of some of the Extreme Left and of the Royalists, Clémenceau withdrew his own support and became a vigorous combatant against the Boulangist movement, though the Radical press and a section of the party continued to patronize the general. By his exposure of the Wilson scandal, and by his personal plain-speaking, M. Clémenceau contributed largely to M. Grévy's resignation of the presidency in 1887, having himself declined Grévy's request to form a Cabinet on the downfall of that of M. Rouvier; and he was primarily responsible, by advising his followers to vote neither for Floquet, Ferry, nor Freycinet, for the election of an "outsider" as president in M. Carnot. He had arrived, however, at the height

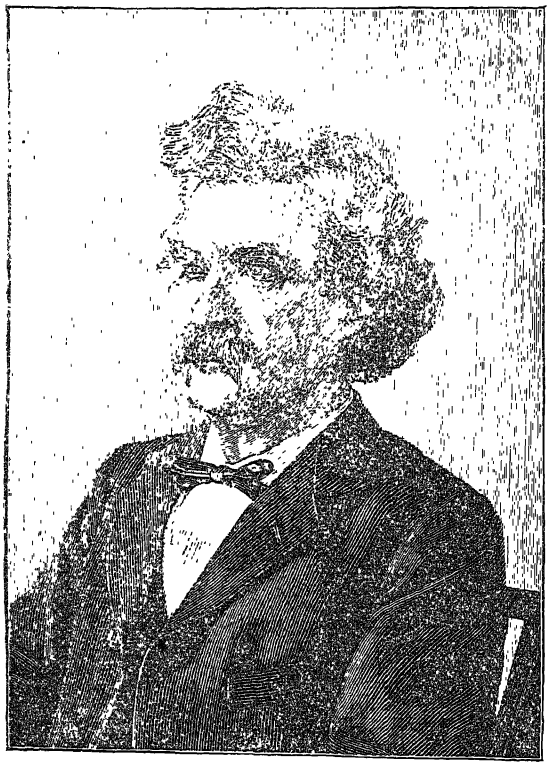
of his influence, and several factors now contributed to his decline. The split in the Radical party over Boulangism weakened his hands, and its collapse made his help unnecessary to the moderate republicans. A further misfortune occurred in the Panama affair, Clémenceau's relations with Cornelius Herz leading to his being involved in the general suspicion; and, though he remained the leading spokesman of French Radicalism, his hostility to the Russian alliance so increased his unpopularity that in the election for 1893 he was defeated for the Chamber, after having sat in it continuously since 1876. After his defeat for the Chamber, M. Clémenceau confined his political activities to journalism, his career being further overclouded—so far as any possibility of regaining his old ascendancy was concerned—by the long-drawn-out Dreyfus case, in which he took an active and honourable part as a supporter of M. Zola and an opponent of the anti-Semitic and Nationalist campaign. He was the founder of the newspaper *L'Aurore*, in which M. Zola published his famous open letter "J'accuse," and thus prepared the way for the revision of the first Dreyfus trial

**Clemens Romanus** (see *Ency. Brit.*, ninth ed., vol. ii. p. 195). Further knowledge requires a restatement of the facts concerning the Epistle of Clement of Rome to the Corinthians. This epistle was occasioned by a dispute in the Church of Corinth, which had led to the ejection of several presbyters from their office. It does not contain Clement's name, but is addressed by "the Church of God which sojourneth in Rome to the Church of God which sojourneth in Corinth." But there is no reason for doubting the universal tradition which ascribes it to Clement, or the generally accepted date, *c.* A.D. 96. No claim is made by the Roman Church to interfere on any ground of superior rank; yet it is noteworthy that in the earliest document outside the canon which we can securely date, the Church in the imperial city comes forward as a peacemaker to compose the troubles of a Church in Greece. Nothing is known of the cause of the discontent; no moral offence is charged against the presbyters, and their dismissal is regarded by Clement as high-handed and unjustifiable, and as a revolt of the younger members of the community against the elder. After a laudatory account of the past conduct of the Corinthian Church, he enters upon a denunciation of vices and a praise of virtues, and illustrates his various topics by copious citations from the Old Testament scriptures. Thus he paves the way for his tardy rebuke of present disorders, which he reserves until two-thirds of his epistle is completed. Clement is exceedingly discursive, and his letter reaches twice the length of the Epistle to the Hebrews. Many of his general exhortations are but very indirectly connected with the practical issue to which the epistle is directed. Indeed, his latest editor, Rudolf Knopf, is convinced that he was drawing largely upon the homiletical material with which he was accustomed to edify his Roman congregation. This view receives some support from the long liturgical prayer at the close, which almost certainly represents the intercession which he was wont to use in his Roman Eucharists. But we must not allow such a theory to blind us to the true wisdom with which the writer defers his censure. He knows that the roots of the quarrel lie in a wrong condition of the Church's life. His general exhortations, courteously expressed in the first person plural, are directed towards a wide reformation of manners. If the wrong spirit can be exorcised, there is hope that the quarrel will end in a general desire for reconciliation. The most permanent interest of the epistle lies in the conception of the grounds on which the Christian ministry rests according to the view of a prominent teacher before the first century has closed. The orderliness of Nature is appealed to as expressing the mind of its Creator. The orderliness of Old Testament worship bears a like witness; everything is duly fixed by God: high priests, priests and Levites, and the people in the people's place. Similarly in the Christian dispensation all is in order due. "The apostles preached the gospel to us from the Lord Jesus Christ; Jesus Christ was sent from God. Christ then is from God, and the apostles from Christ. . . . They appointed their first-fruits, having tested them by the Spirit, as bishops and deacons of those who should believe. . . . Our apostles knew through our Lord Jesus Christ that there would be strife about the name of the bishop's office. For this cause, therefore, having received perfect foreknowledge, they appointed the aforesaid, and afterwards gave a further injunction (ἐπινομήν has now the further evidence of the Latin *legem*) that, if these should fall asleep, other approved men should succeed to their ministry. . . . It will be no small sin in us if we eject from the bishop's office those who have offered the gifts blamelessly and holily" (cc. xlii. xliv.).

The epistle was published in 1633 by Patrick Young from Cod. Alexandrinus, in which a leaf near the end was missing, so that the great prayer (cc. lv.–lxiv.) remained unknown. In 1875 (six years after Lightfoot's first edition) Bryennius published a complete text from the MS. in Constantinople (dated 1055), from which in 1883 he gave us the *Didaché*. In 1876 Bensly found a complete Syriac text in a MS. recently obtained by the University Library at Cambridge. Lightfoot made use of these new materials in an Appendix (1877); his second edition, on which he had been at work at the time of his death, came out in 1890. This must remain the standard edition, notwithstanding Dom Morin's most interesting discovery of a Latin version (1894), which was probably made in the 3rd century, and is a valuable addition to the authorities for the text. Its evidence is used in a small edition of the epistle by R. Knopf, Leipzig, 1899 (J. A. R.)

**Clemens, Samuel Langhorne,** better known as MARK TWAIN (1835-——), the most widely popular of American humorists, and a writer of striking vigour and directness, was born 30th November 1835, at Florida, Missouri. His father was a country merchant from Tennessee, who moved soon after his son's birth to Hannibal, Missouri, a little town on the Mississippi. When the boy was only twelve his father died, and thereafter he had to get his education as best he could. Of actual schooling he had little. He learned how to set type, and as a journeyman printer he wandered widely, going even as far east as New York. At seventeen he went back to the Mississippi, determined to become a pilot on a river steamboat. In his *Life on the Mississippi* he has recorded graphically his experiences while "learning the river." But in 1861 the war broke out, and the pilot's occupation was gone. After a brief period of uncertainty the young man started west with his brother, who had just been appointed lieutenant-governor of Nevada. He went to the mines for a season, and there he began to write in the local newspapers, adopting the pen name of "Mark Twain." He drifted in time to San Francisco, and it was a newspaper of that city which in 1867 supplied the money for him to join a party going on a chartered steamer to the Mediterranean ports. The letters which he wrote during this voyage were gathered in 1869 into a volume, *The Innocents Abroad*, and the book immediately won a wide and enduring popularity. This popularity was of service to him when he appeared on the platform with a lecture—or rather with an apparently informal talk, rich in admirably-delivered anecdote. He edited a daily newspaper in Buffalo for a few months, and in 1870 he married Miss Olivia L. Langdon, removing a year later to Hartford, where he established his home. *Roughing It* was published in 1872, and in the year after he collaborated with Charles Dudley Warner in *The Gilded Age*

from which he made a play, acted many hundred times with John T. Raymond as "Colonel Sellers." In 1875 he published *Tom Sawyer*, the sequel to which, *Huckleberry Finn*, did not appear until 1884. The result of a second visit to Europe was humorously recorded in *A Tramp Abroad*, published in 1882, in which year he also issued a more or less historical romance, *The Prince and the Pauper;* and a year later came *Life on the Mississippi*. *Huckleberry Finn*, the next of his books, was published (in 1884) by a firm in which the author was chief partner. This firm prospered for a while, and issued in 1889 Mark Twain's own comic romance, *A Connecticut Yankee at King Arthur's Court*, and in 1892 a less successful novel, *The American Claimant*. But after a severe struggle the publishing house failed, leaving the author charged with its very heavy debts. Since this disaster he has issued



SAMUEL CLEMENS.
*(From a photo by Elliott and Fry, London.)*

a third Mississippi Valley novel, *Pudd'nhead Wilson*, in 1894, and in 1896 another historical romance, *Joan of Arc*, wherein the maid is treated with the utmost sympathy and reverence. He went on a tour round the world, partly to make money by lecturing and partly to get material for another book of travels, published in 1897, and called in America *Following the Equator*, and in England *More Tramps Abroad*. From time to time he had collected into volumes his scattered sketches; of these the first, *The Jumping Frog*, appeared in 1867, and the latest, *The Man that Corrupted Hadleyburg*, in 1900. To be recorded also is a volume of essays and literary criticisms, *How to Tell a Story*, printed in 1897. A complete edition of his works was published in twenty-two volumes in 1899–1900 by the American Publishing Company of Hartford. And in this last year, having paid off all his debts, he returned to America to be most cordially welcomed by his fellow-countrymen.

Mark Twain is commonly considered as a humorist, and no doubt he is a humorist of a remarkable comic force and of a refreshing fertility. But the books in which his humour is broadly displayed, the travels and the sketches, are not really so significant of his power as the three novels of the Mississippi, *Tom Sawyer*, *Huckleberry Finn*, and *Pudd'nhead Wilson*, wherein we have preserved a vanished civilization, peopled with typical figures, and presented with inexorable veracity. There is no lack of humour in them, and there is never a hint of affectation in the writing; indeed, the author, doing spontaneously the work nearest to his hand, was very likely unconscious that he was making a contribution to history. But such *Huckleberry Finn* is, beyond all question; it is a story of very varied interest, now comic, now almost tragic, frequently poetic, unfailingly truthful, although not always sustained at its highest level. And in these three works of fiction there are not only humour and pathos, character and truth, there is also the largeness of outlook on life such as we find only in the works of the masters. Beneath his fun-making we can discern a man who is fundamentally serious, and whose ethical standards are ever lofty. Like Cervantes at times, Mark Twain reveals a depth of melancholy beneath his playful humour, and like Molière always, he has a deep scorn and a burning detestation of all sorts of sham and pretence, a scorching hatred of humbug and hypocrisy. Like Cervantes and like Molière, he is always sincere and direct. (B. M.)

**Clermont-Ferrand,** chief town of department Puy-de-Dôme, 261 miles south of Paris by rail. It is the headquarters of the 13th army corps, and there are a commercial museum and a meteorological observatory. Amongst the principal manufactures are india-rubber goods and alimentary pastes; textile industries are no longer important. It has mineral waters in repute locally. Population (1881), 32,256; (1896), 38,913, (comm.) 43,688; (1901), 52,933.

**Clermont-Ganneau, Charles Simon** (1846–——), French orientalist, the son of a sculptor of some repute, was born in Paris, 19th February 1846. After an education at the École des Langues Orientales, he entered the diplomatic service as dragoman to the consulate at Jerusalem, and afterwards at Constantinople. He laid the foundation of his reputation by his discovery (in 1870) of the "stele" of Mesha, which bears the oldest Semitic inscription known. In 1874 he was employed by the British Government to take charge of an archæological expedition to Palestine, and was subsequently entrusted by his own Government with similar missions to Syria and the Red Sea. He was made Chevalier of the Legion of Honour in 1875. After serving as vice-consul at Jaffa from 1880 to 1882, he returned to Paris as "Secrétaire-Interprète" for oriental languages, and in 1886 was appointed consul of the first class. He subsequently accepted the post of director of the École des Langues Orientales and professor at the Collège de France. In 1889 he was elected a member of the Académie des Inscriptions et Belles Lettres, of which he had been a correspondent since 1880. His chief publications, besides a number of contributions to journals, are:—*Palestine Inconnue* (1886), *Études d'Archéologie Orientale* (1880, &c.), *Les Fraudes Archéologiques* (1885), *Recueil d'Archéologie Orientale* (1885, &c.), *Album d'Antiquités Orientales* (1897, &c.). He was principally instrumental in exposing the famous Shapira forgeries of Hebrew texts.

**Cleveland,** the seventh largest city in the United States, and the largest of the state of Ohio, situated at the mouth of the Cuyahoga river, on the southern shore of Lake Erie, in lat. 41° 30′ N. and long. 81° 47′ W. Divided unequally by the river, it stretches along the shore for 10 miles, with a maximum depth of 6 miles. It is connected by steamship lines with all the lake ports

from Duluth to Buffalo, Toronto, Ogdensburgh, and with those along the St Lawrence. It lies on or near all the trunk lines from New York to Chicago. The Lake Shore and Michigan Southern, the New York, Chicago, and St Louis (Nickel Plate) Railways pass through; the Erie, Pennsylvania, Baltimore, and Ohio have terminal facilities; while the Cleveland, Columbus, Cincinnati, and St Louis (Big Four), and several Ohio lines start from the city. The Ohio Canal, which gave Cleveland its original prosperity, is little used, and in 1879 its terminal facilities were granted to the Valley, now the Baltimore and Ohio Railway. Seven suburban electric railways, from 20 to 40 miles long, radiate from the Public Square, and carry package freight as well as passengers. There are 160 miles of streets, paved chiefly with Medina dressed stone. The improved public dock frontage on the river and lake amounts to 2500 feet, the unimproved to 3000 feet. Since 1879 the national Government has been building and improving a breakwater to create a harbour of refuge, which already affords a protected shore-line of over 2 miles. The widening of the river mouth from a minimum of 165 feet to a uniform width of 325 feet, and the widening and straightening of the lower course of the river, are also far advanced. These improvements were vital to the city, which is the greatest ore market in the world. At its own docks, not to mention the harbours within the customs district, the business of which is nearly all done in the city, were received in 1890, 1,945,432 tons of Lake Superior iron ore, and in 1900, 3,823,314 tons. The total tonnage in 1890 was 4,668,040; in 1900, 7,488,396. As a manufacturing town Cleveland owes its greatness to the facility with which iron can be brought from the Lake Superior district by water-route, and coal by rail from the Ohio and Pennsylvania mines. The capital invested in national banks in 1890 was $7,550,000; in 1900, $10,965,000. The deposits were for these years $15,037,606 and $48,780,227. For the same years capital in savings banks was $2,469,460 and $7,725,000; the deposits, $36,914,354 and $96,328,461. Of these deposits $34,632,732 were in one institution, the Society for Savings. The population in 1890 was 261,353. In 1900 it was 381,768, of whom 124,631 were foreign-born and 5988 were negroes. The death-rate in 1890 was 20·2; in 1900 it was 17·1. The water-supply from the old tunnel into the lake became unsatisfactory, and a new tunnel 26,000 feet in length was projected, of which 16,000 feet were completed in 1900. The school system was reorganized in 1892 by a law which placed the management of school affairs in the hands of a director and an elective council of seven members. The director was given power to appoint a superintendent of instruction, who was to receive authority to name the whole teaching force. Besides large private schools, among which is the University School for boys, with an eight years' course, emphasizing manual training and the supervision of athletic exercises, there are the Western Reserve University, with its medical school (opened 1843), the School of Law (1892), the Dental College (1893), the Adelbert College (until 1882 the Western Reserve College (1826) at Hudson, Ohio), the College for Women (1888); the Case School of Applied Sciences, the Cleveland College of Physicians (a part of Ohio Wesleyan University, Delaware, Ohio), and the Cleveland Homœopathic Medical College. There are 15 hospitals, including the United States Marine Hospital. The Public Library, the Case Library, the University Library, and the Western Reserve Historical Society possess about 300,000 volumes. There are over 245 churches, and the leading sects are the Roman Catholics with 39 churches, the Methodists with 24, the Baptists with 24, and the Congregationalists with 24. By the Municipal Reform Bill, 16th March 1891, a new city charter embodying the federal plan was granted The mayor appoints as his cabinet six directors—law, public works, police, fire, accounts, and charities and corrections. In order that responsibility might be fixed these directors were to appoint their subordinates. At first the system worked well, but in course of time interested officials, to serve their own ends, constructed a dangerous "machine," the ramifications of which reached into the council, the courts, and the state legislature. At length the independent voters organized a revolt, and overthrew the "boss" in the April elections of 1899. The total valuation of property in the city in 1880 was $73,647,194; in 1890, $99,614,055; in 1900, $142,768,280. The tax-rate for all purposes, city, county (Cuyahoga), and state, was in 1890, $29.30, and in 1900, $30.00. The total indebtedness in 1890 was $8,330,035, and in 1900, $14,121,530. The park system includes 22 parks and drives, with an extent of 1326·19 acres. There are 27·94 miles of roads. Since much of the land was presented to the city the money expended ($3,032,944 from 1st January 1894 to 1st January 1900) on the system has largely gone for improvements. In recent history the most notable events were the elaborate celebration of the centennial of the city in 1896 and the street railway strike of 1899, in which the workers attempted to force a redress of grievances and a recognition of their union. Mobs attacked the cars, and cars were blown up by dynamite. The strikers were beaten, but certain abuses were corrected.

CHARLES WHITTLESEY. *Early History of Cleveland*, 1867.—J. H. KENNEDY. *History of the City of Cleveland*, 1896.

(H. E. B.)

**Cleveland, Grover** (1837——), President of the United States from 1885 to 1889, and again from 1893 to 1897, was born in the village of Caldwell, New Jersey, 18th March 1837. His father was a clergyman of the Presbyterian Church. The Clevelands were of good colonial stock, descendants of Moses Cleveland who emigrated from Ipswich, England, in 1635. Grover was the fifth in a family of nine children. They removed to Fayetteville, and afterwards to Clinton, New York. It was intended that Grover should be educated at Hamilton College, but this was prevented by his father's death in 1852. A few years later he drifted westward with twenty-five dollars in his pocket. The autumn of 1855 found him in a law office in the city of Buffalo, where he was privileged to use the books in the library and pick up knowledge by observing what was going on around him. This was the customary way at that time for a young man to equip himself for the legal profession. At the end of four years he passed the required examination for admission to the bar. During these years he had made a place for himself by force of character in the office where he had studied. Industry, intellectual integrity, and calm courage were then, as in after life, his marked traits. It cost him no effort to stand firmly by any principle which he deemed right or to defend any opinion which he had espoused. In 1863 he was appointed assistant district attorney, or public prosecutor, of Erie county, of which Buffalo is the chief city. This was his first public office, and it came to him, like all later preferments, without any solicitation of his own. He was a member of the Democratic party, and Erie county was usually Republican by a decisive majority. In 1869 Mr Cleveland was named by his party for the office of sheriff and was elected. In 1881 he was elected mayor of Buffalo, and in the following year governor of New York, receiving a majority of nearly 200,000 votes. As governor Mr Cleveland's course was marked by the sterling qualities that he had displayed in his other public

positions. His appointees were chosen for their business qualifications. The demands of party leaders were made subordinate to public interests. He promoted the passage of a good civil service law. All bills passed by the legislature were subjected to the governor's laborious personal scrutiny, and the veto power was used without fear or favour.

The Democratic party had been out of power in national affairs more than twenty years. In the interval a great civil war had been fought, slavery had been abolished, and the Union reconstructed. New subjects of national concern had begun to awaken attention. Serious abuses had crept into the civil service, and some scandals of considerable magnitude had been exposed from time to time, pointing to the necessity of radical measures of reform. While the public mind was in a sensitive state on this subject (1884), the Republican party nominated

GROVER CLEVELAND.
(*From a photo by B. J. Falk, Waldorf-Astoria, N. Y.*)

James G. Blaine for president, and the Democrats nominated Mr Cleveland. The latter was elected, gaining the vote of the state of New York by a plurality of 1047 in a total of 1,171,263. He took the oath of office and delivered the usual address 4th March 1885. He had never been in Washington City in a public capacity before. He had been known to the country at large only two years. He was a stranger to most of the men who stood around him at the ceremony of inauguration. Yet it was noticed that he entered upon his new duties with the same equipoise that he had shown in the humbler stations he had filled. When his brief inaugural address was finished, the older statesmen present felt that no apologies were needed for his being there, and that the executive branch of the Government was in safe hands.

Mr Cleveland's first term of four years was uneventful, but was marked by firmness, justice, and steady adherence on his part to the principles which he deemed salutary to the nation. He was especially concerned in promoting a non-partisan civil service. Congress had passed a law in 1883 to classify the subordinate places in the service, and to make entrance to it, and promotion therein, depend upon competitive examination of applicants, instead of mere political influence. The first test of the efficiency and permanence of this law came with the shifting of political power at Washington. The new president stood firmly by the new law. It applied only to places of the rank of clerkships, but the president was authorized to add others to the classified service from time to time. He added 11,757 during his first term.

President Cleveland made large use of the veto power upon bills passed by Congress. The most important one vetoed was the Dependent Pension Bill, a measure of extreme profligacy opening the door, by the vagueness of its terms, to enormous frauds upon the Treasury. In 1887 there was a large and growing surplus in the Treasury. As this money was drawn from the channels of business and locked up in the public vaults, the president looked upon the condition as fraught with danger to the commercial community, and he addressed himself to the task of reducing taxation. About two-thirds of the public revenue was derived from duties on imports, in the adjustment of which the doctrine of protection to native industry had a large place. Mr Cleveland attacked the system with great vigour in his annual message of 1887. He did not propose the adoption of free trade. Yet he alarmed and exasperated the protected classes, among whom were many Democrats, and spurred them to extraordinary efforts to prevent his re-election.

In the following year (1888) the Democrats re-nominated Mr Cleveland, and the Republicans nominated Benjamin Harrison of Indiana. The latter received a majority of the electoral votes and accordingly became president. Mr Cleveland retired to private life and resumed the practice of the legal profession in the city of New York. He had married, 2nd June 1886, Miss Frances Folsom, a daughter of a former law partner in Buffalo.

Congress had passed a law in 1878 requiring the Treasury department to purchase a certain amount of silver bullion each month and coin it into silver dollars to be full legal tender. As no time had been fixed for this operation to cease, it amounted to an unlimited increase of a kind of currency that circulated at a nominal value much above its real value. Both political parties were committed to this policy, and strong passions were aroused whenever it was called in question. Mr Cleveland had written a letter for publication before he became president, saying that a financial crisis of great severity must result if this coinage were continued, and expressing the hope that Congress would speedily put an end to it. In 1890 Congress, which was now controlled by the Republican party, passed the McKinley Tariff Act, which repealed the duties on sugar, from which about $60,000,000 of revenue was derived. Simultaneously it passed a new Pension Bill that added $50,000,000 to the public disbursements. Another measure was enacted which nearly doubled the Government's purchases of silver, to be added to the already vitiated currency. Steps had thus been taken which would change an annual surplus of $100,000,000 into a deficit of $70,000,000 as soon as the new laws should take full effect.

In 1892 Mr Cleveland was nominated for president a third time in succession. The only other man in the nation's history thus distinguished was General Jackson. Mr Cleveland was nominated against the unanimous vote and protest of the delegates in the Democratic National Convention from his own state, New York. This was something quite unprecedented. Mr Harrison was the opposing candidate. Mr Cleveland received 277 electoral

votes and Mr Harrison 145. Mr Cleveland's second term embraced some notable events. The most important was the repeal of the silver legislation, which had been a growing menace for fifteen years. Nearly $600,000,000 of "fiat money" (currency circulating on the faith of the Government) had been thrust into the channels of commerce in addition to $346,000,000 of legal tender notes that had been issued during the civil war. A reserve of $100,000,000 of gold had been accumulated for the redemption of these notes. In April 1893 the reserve fell below this sum. A panic ensued. President Cleveland called an extra session of Congress to repeal the silver law. The House promptly passed the repealing act. In the Senate there was a protracted struggle. The Democrats now had a majority of that body and they were more decidedly pro-silver than the Republicans. The president had undertaken to coerce his own party to do something against its will. This was perhaps his greatest public service. The repealing bill passed the Senate 30th October. The mischief, however, was not ended. The deficit in the Treasury made it inevitable that the gold reserve should be used to meet current expenses. Holders of the Government's legal tender notes anticipating this fact presented them for redemption. Borrowing was resorted to by the Government. Bonds were issued and sold to the amount of $162,000,000. The business world was in a state of constant agitation. Bank failures were numerous and commercial distress widespread. The Republican party, which had laid the train for this disaster, escaped unhurt, because the final explosion took place during a Democratic administration. The underlying causes were too involved and intricate for popular understanding. Among the consequences of the panic was a reduction of wages in many employments, accompanied by labour troubles more or less serious. The centre of disturbance was at Chicago where one Debs, a labour agitator, undertook to compel the Pullman Palace Car Company to raise the wages of its workmen, by boycotting its cars. Twenty-three railways were disabled at one time by the refusal of their employees to operate trains containing Pullman cars, or allow others to do so. The disorder extended to the Pacific coast, causing riot and bloodshed in several places. President Cleveland waited a reasonable time, as he conceived, for the governor of Illinois to put an end to the disorder in that state. On 6th July 1894 he directed the military forces of the United States to clear the way for trains carrying the mails. The rioters in and around Chicago were dispersed in a single day, and within a week the boycott was everywhere broken. No act of his career gave Mr Cleveland more éclat than the suppression of the Debs riots.

On 17th December 1895 President Cleveland astounded the country and the civilized world by sending a special message to Congress virtually recommending war against Great Britain unless she should accept his views respecting an undetermined boundary line between Venezuela and British Guiana. Mr Cleveland's foreign policy hitherto had been marked by prudence, conservatism, and a scrupulous regard for the rights of other peoples. He had put a strong curb on Cuban filibustering. He had withdrawn a treaty negotiated by his predecessor to annex Hawaii, because, as he said, its lawful government had been overthrown by the diplomatic and naval representatives of the United States. In short, he had won almost unbounded confidence, and now when his voice was for war he carried the country with him as no other man could have done. Yet a large body of sober-minded people throughout the country, who had been Mr Cleveland's firm supporters and his chief reliance in all previous emergencies, were now detached from him, more in sorrow than in anger. In the money market the Venezuela message came as "a bolt from the blue." A panic of great severity ensued, a run on the Treasury began, and the president was compelled to make a fresh loan, in time of peace, of $100,000,000. On 12th November 1896 an agreement was made for arbitration of the Venezuelan controversy, in which the contention of Great Britain was safeguarded by a clause that adverse holding during a period of fifty years should make a good title. It has been said that Mr Cleveland was vindicated by the result, but this view overlooks two facts of importance, viz., that war was avoided only by the calmness of the British ministry and the British public; and that Mr Cleveland gave the greatest spur and impetus to the war spirit among his countrymen that the present generation has known. On 8th January 1897 Mr Cleveland transmitted to the Senate a treaty for the arbitration of all future differences between the United States and Great Britain, earnestly recommending its approval. The Senate did not ratify this treaty, but its aims have been partially accomplished on a larger scale by the agreements of the Hague Conference.

During his second term Mr Cleveland added 44,004 places in the civil service to the classified list, bringing them within the rules of the merit system. This was a greater number than all that had been placed in the list before, and brought the whole number up to 86,932.

Mr Cleveland's second term expired 4th March 1897, and he then retired into private life in the university town of Princeton, New Jersey. (H. WH*.)

**Cleves,** in German *Kleve*, a town and watering-place of Prussia, in the Rhine province, between the Rhine and the frontier of Holland, 40 miles by rail north-north-west from Crefeld. It has a monument to the legendary Knights of the Swan (1882); a collection of antiquities, preserved in the town hall; and an agricultural school: also, manufactures of cheese, tobacco, agricultural implements, &c. Population (1885), 10,170; (1895), 10,986; (1900), 14,678.

**Clichy,** or CLICHY LA GARENNE, a town of France, department of Seine, in the arrondissement of St Denis, and immediately north of the outer circle of Paris, of which it is a suburb. Its manufactures include oil and starch. It was a residence of the Merovingian kings, and was then known as *Clippiacum*. Population (1881), 24,223; (1891), 30,561; (1901), 39,521.

**Clifford, William Kingdon** (1845–1879), English mathematician and philosopher, was born 4th May 1845 at Exeter, where his father was a prominent citizen. He was educated at a private school in his native town, at King's College, London, and at Trinity College, Cambridge, where he was elected fellow in 1868, after being second wrangler in 1867 and second Smith's prizeman. In 1871 he was appointed professor of mathematics at University College, London, and in 1874 became fellow of the Royal Society. In 1875 he married Lucy, daughter of John Lane of Barbados, a lady who has since won distinction as a novelist. In 1876 Clifford, a man of high-strung and athletic, but not robust, physique, began to fall into ill-health, and after two voyages to the South died during the third of pulmonary consumption at Madeira, 3rd March 1879. His works, published wholly or in part since his death, are *Elements of Dynamic* (1879–87), *Seeing and Thinking*, popular science lectures (1879), *Lectures and Essays*, with an introduction by Sir F. Pollock (1879), *Mathematical Papers*, with an introduction by Henry J. S. Smith (1882), and *The Common Sense of the Exact Sciences*, completed by Professor Karl Pearson (1885). Owing to his early death, Clifford's abilities and achievements cannot be fairly judged without reference to the opinion formed of

him by his contemporaries. He impressed every one as a man of extraordinary acuteness and originality; and these solid gifts were set off to the highest advantage by quickness of thought and speech, a lucid style, wit and poetic fancy, and a social warmth which made him delightful as a friend and companion. His powers as a mathematician were of the highest order. It harmonizes with the concrete visualizing turn of his mind that, to quote Professor Henry Smith, "Clifford was above all and before all a geometer." In this he was an innovator against the excessively analytic tendency of Cambridge mathematicians. Among his best papers are those "On the Theory of Distances" and "On the Classification of Loci." In his theory of graphs, or geometrical representations of algebraic formulæ, there are valuable suggestions which have been worked out by others. He was much interested too in those curious investigations into imaginary kinds of space by Gauss, Riemann, and Lobatschewsky, which suggest thoughts upon the ultimate nature and source of mathematical truth. As a philosopher Clifford's name is chiefly associated with two phrases of his coining, "mind-stuff" and the "tribal self." The former symbolizes his metaphysical conception, which was suggested to him by his reading of Spinoza. "Briefly put," says Sir F. Pollock, "the conception is that mind is the one ultimate reality; not mind as we know it in the complex forms of conscious feeling and thought, but the simpler elements out of which thought and feeling are built up. The hypothetical ultimate element of mind, or atom of mind-stuff, precisely corresponds to the hypothetical atom of matter, being the ultimate fact of which the material atom is the phenomenon. Matter and the sensible universe are the relations between particular organisms, that is, mind organized into consciousness, and the rest of the world. This leads to results which would in a loose and popular sense be called materialist. But the theory must, as a metaphysical theory, be reckoned on the idealist side. To speak technically, it is an idealist monism." The other phrase, "tribal self," gives the key to Clifford's ethical view, which explains conscience and the moral law by the development in each individual of a "self," which prescribes the conduct conducive to the welfare of the "tribe." Much of Clifford's contemporary prominence was due to his attitude towards religion. Animated by an intense love of truth and devotion to public duty, he waged war on such ecclesiastical systems as seemed to him to favour obscurantism, and to put the claims of sect above those of human society. The alarm was greater, as theology was still unreconciled with the Darwinian theory; and Clifford was regarded as a dangerous champion of the anti-spiritual tendencies then imputed to modern science. (H. ST.)

**Clifton.** See BRISTOL.

**Clinton,** capital of Clinton county, Iowa, U.S.A., situated in 41° 51′ N. lat. and 90° 11′ W. long., on the west bank of the Mississippi river, at an altitude of 589 feet. It is entered by four great railway systems, the Burlington, Cedar Rapids, and Northern, the Chicago, Burlington, and Quincy, the Chicago and North-Western, and the Chicago, Milwaukee, and St Paul Railways, and it is in the main a commercial city. The Mississippi is here crossed by a fine iron bridge, some 4000 feet in length. Clinton is the site of Wartburg College, a Lutheran institution. Population (1880), 9052; (1890), 13,619. By the addition of the city of Lyons in 1895 the population was increased to 23,377, and in 1900 it was 22,698.

**Clinton,** capital of Henry county, Missouri, U.S.A., situated in 38° 23′ N. lat. and 93° 46′ W. long., in the western part of the state, at an altitude of 800 feet. It has three railways, the Missouri, Kansas, and Texas, the Kansas City, Fort Scott, and Memphis, and the Kansas City, Osceola, and Southern. Population (1880), 2868; (1890), 4737; (1900), 5061.

**Clinton,** a town of Worcester county, Massachusetts, U.S.A., situated near the centre of the state, on branches of the Boston and Maine, and the New York, New Haven, and Hartford Railways, at an altitude of 308 feet. It is small in area, containing but 7 square miles of hilly surface. The village of Clinton is on Nashua river, and has extensive manufactures of cotton and woollen goods, wire-cloth, and iron and steel. Population (1880), 8029; (1900), 13,667.

**Clitheroe,** a municipal borough and market town in the Clitheroe parliamentary division (since 1885) of Lancashire, England, on the Ribble, 20 miles south-west of Burnley by rail and 12 miles by road. A public hall has been erected, and in 1895 Clitheroe Castle, formerly extra-parochial, became part of Clitheroe borough. Area, 2381 acres; population (1881), 10,177; (1901), 11,414.

**Clonmel,** an inland town, in the province of Munster, Ireland, on the river Suir, 104 miles south-west of Dublin, on the Waterford, Limerick, and Western Railway. It ceased to be a parliamentary borough in 1885, and in 1898 the portion situated in Waterford was added to Tipperary. By the Local Government Act, 1898, the borough retains its mayor and corporation, which, however, has now practically the status of an urban district council. It is an agricultural centre, and there are frequent fairs. Population (1881), 9325; (1891), 8480; (1901), 10,163. The area of the borough was recently extended and now comprises 1301 acres.

**Closure.** See PARLIAMENT.

**Clovelly,** a fishing village of Devonshire, England, which climbs up the sides of a rocky cleft of the steep (400 feet) south coast of Barnstaple Bay, 11 miles west from Bideford. Its quaintness and the charm of its surroundings make it a favourite excursion from Ilfracombe. Dickens describes the place in *A Message from the Sea*. Population (1901), 621.

**Clyde, The,** a river and firth of Scotland. The river rises as the Daer water in the parish of Crawford, Lanarkshire, 1600 feet above sea-level. Its length from that point to Dumbarton, where the firth may be taken to begin, is 106 miles, and the drainage area is estimated at 1481 square miles. At Lanark (61 miles) it is broken by four falls, which occur within a distance of $3\frac{3}{4}$ miles, the river descending in that space 230 feet, or about 61 feet in the mile. Thence to the sea the fall is about 4 feet and a $\frac{1}{2}$ inch in the mile. The firth measures about 64 miles from Dumbarton to Ailsa Craig, an island lying between Girvan on the Ayrshire coast and the Mull of Kintyre in Argyllshire, and its breadth varies from a mile at Dumbarton to 37 miles on a line drawn through Ailsa Craig. In depth it varies from a minimum of 22 feet (in the navigable channel) at Dumbarton to 99 fathoms between Ardlamont and Kintyre. The tide ascends above Glasgow, to which its rise is to be limited by the construction of a weir, replacing an older one which was destroyed in 1884. Head ports are Glasgow, Port-Glasgow, Greenock, Ardrossan, Irvine, Troon, Ayr, and Campbeltown.

**Clydebank,** a police burgh of Dumbartonshire, Scotland, on the right bank of the Clyde, $6\frac{3}{4}$ miles from Glasgow by road. There are eight stations. Shipbuilding works were planted in 1875 in a purely rural district, and were followed by a large sewing-machine factory. In 1886 the villages of Dalmuir and Yoker and Kilbowie were formed into a burgh, and the municipality is one of the most enterprising in Scotland. The works and factory each

employ about 7000 hands. There are various other works, including the building and repairing yards of the Clyde Navigation Trust. Municipal buildings, including baths, are being erected at a cost of £40,000. Population (1891), 9998; (1901), 18,654.

**Coahuila,** a state of Mexico, bounded on the N. by the United States, on the E. by the state of Nuevo León, on the S. by those of San Luis Potosí and Zacatecas, on the W. and S.W. by Durango, and on the N.W. and W. by Sonora, has an area of 62,376 square miles. In 1879 the population was 130,026, and in 1895 it was 241,026. The flora comprises over sixty varieties of trees of the cold and temperate zones, and fifty belonging to the hot lands. Agriculture is the principal industry, cotton, maize, wheat, beans, sugar-cane, linseed, and about thirty species of leguminous plants being the chief products. Cattle-raising is also extensively followed. The mines are being rapidly developed, especially in the Sierra Mojada, Sierra del Carmen, and in the valley of Santa Rosa. The state, which is divided into five districts and thirty-three municipalities, is one of the most prosperous commercial regions of the Republic, due principally to its excellent railway system. The capital, Saltillo (population, 26,801), is 615 miles from Mexico City by rail. It has good public buildings, a State college, public library, &c., and is noted for its manufacture of shawls (*sarapes*), cotton cloth, knit goods, and flour. Amongst other towns are Parras (8326), Monclova, Ciudad Porfirio Díaz, Viesca, Matamoros.

**Coal.**—During the period that has elapsed since the publication of the article contained in the ninth edition of this Encyclopædia, the development in the methods of winning and working coal has been very considerable, especially in the direction of increasing the output from individual centres of production concurrently with a general diminution in the length of the working day. This has been attended, at any rate in the older coal-fields, with a rapid increase in the depth of workings and greatly increased cost and difficulty in opening new mines, with the result that the comparatively rough methods and appliances of earlier times have given way to more economical methods of working underground, and machinery of more refined construction. The main winding engines, especially, are now constructed upon the most improved types, in order to save fuel in working. Similar improvements have been introduced in the methods of underground haulage, and horses on underground lines have been largely replaced by mechanical traction, the substitution of electric for steam driven motors, and the use of electric locomotives being specially noticeable. In the main operation of getting or removing the coal, machine-cutting has to some extent taken the place of hand labour, although the progress in this direction has been more marked in America than in Europe, and even there the proportion of the output obtained with the use of such mechanical aids is only small when compared with that due to hand labour. This, however, is rapidly changing, owing to the increased flexibility in working of electric motors, which will in the near future probably take the first place in this as in other branches of coal-mining. To enter, however, into the details of these and other changes would involve discussion of mechanical and other technical matters beyond the scope of the present work, which is to be regarded as supplementary to the article in the ninth edition, the additional matter being noticed somewhat in the same order as that previously adopted.

During the past few years the question of the origin and mode of formation of coal has received considerable attention from geologists, but it cannot be said that any authoritative new solution of the problem has been propounded. Speaking generally, the tendency is towards a modification of the view of which Logan, De la Beche, Dawson, and Newberry may be taken as the principal exponents, that coal seams are essentially the remains of forests upon the sites of their original growth, a detrital origin being supposed for a part, if not the whole, of the carbonaceous material, which may have been derived from adjacent higher-lying land by the action of river currents. This view, known as the delta hypothesis, has found considerable favour in France, especially from study of the coal-field of Saint Étienne, where the seams vary very irregularly in thickness and character, in a way which seems to be incompatible with the hypothesis of a tranquil accumulation *in situ*. As regards the changes involved in the actual transformation of plant structures into lignite and coal, one of the most important series of researches is due to M. B. Renault (*Bulletin de la Société de l'Industrie Minérale*, 3 Ser., vol. xiii. p. 865), who, starting from the study of peat, finds that the chief agents in the transformation of cellulose into peaty substances are saprophytic fungi and bacterial ferments. As the former are only active in the presence of air, while the latter are anærobic, the greater or less activity of either agent is conditioned by variation in the water-level of the bog. The destructive agency of bacteria seems to be limited by the production of ulmic acid of the composition, carbon 65·31, hydrogen 3·85 per cent., which is a powerful antiseptic. By the progressive elimination of oxygen and hydrogen, partly as water and partly as carbon dioxide and marsh gas, the ratio of carbon to oxygen and hydrogen in the residual product increases in the following manner:—

*Origin and composition of coal.*

| | C : H. | C : O. |
|---|---|---|
| Cellulose | 7·2 | 0·9 |
| Peat | 9·8 | 1·8 |
| Lignite, imperfect | 12·2 | 2·4 |
| ,, perfect | 12·6 | 3·6 |

The constituents of lignite are generally similar to those of peat, with the addition of some animal (infusorial) remains, the degraded vegetable tissues forming a paste originally plastic, which has converted the more resisting parts of the plants into a compact mass. From the figures given above it will be seen that oxygen is less rapidly eliminated than hydrogen, the change to lignite being similar to that obtaining in the case of peat, but further advanced.

Bituminous shale and Boghead or Torbane Hill coal are considered by Renault to be mainly alteration-products of masses of gelatinous fresh-water algæ, which by an almost complete elimination of oxygen have been transformed into substances approximating to the formulæ $C_2H_3$ and $C_3H_5$, where $C:H = 7{\cdot}98$ and $C:O+N = 46{\cdot}3$. In cannel coals the prevailing vegetable constituents are spores of cryptogamic plants, algæ being rare and in many cases absent. The detection of bacilli in coal is a difficult matter, owing to its opacity; but by making very thin sections and employing high magnification, 1000 to 1200 diameters, Renault has been enabled to detect numerous forms in the woody parts included in coal. One of these, named *Micrococcus carbo*, in many respects resembles the living *Cladothryx* found in the wood of trees buried in peat-bogs in process of formation. Clearer evidence has been obtained from wood partially mineralized by silica or carbonate of lime included in the coal.

The transformation of woody fibre into coal is attended with considerable contraction, which may be from $\frac{1}{12}$ to $\frac{1}{13}$ of the original volume, but this is unequally distributed; it is mainly in the direction of the thickness, so that minute objects seen on the flat may keep nearly their

original dimensions. The evidence for this is to be seen in the large number of microphotographs in the memoir just referred to, which represents the result of twenty-one years' work. Approximately the change of wood into coal, and the proportion of the valuable product eliminated, may be represented as follows:—

$$\underset{\text{Cellulose.}}{4(C_6H_{10}O_5)} = \underset{\text{Coal.}}{C_9H_6O} + \underset{\text{Methane.}}{7CH_4} + \underset{\text{Carbon dioxide.}}{8CO_2} + \underset{\text{Water.}}{3H_2O}.$$

The solid product $C_9H_6O$ corresponds to an average bituminous coal of the composition, carbon 83·1, hydrogen 4·6, oxygen 12·3 per cent., and represents about 20 per cent. of the original weight of cellulose and 45 per cent. of its heating power. Another aid to the study of the structure of coal has been found by H. M. Couriot (*Annales de la Société Géologique de Belgique*, vol. xxiii. p. 105) in Rontgen photography, the carbonaceous or combustible portion being readily permeable by X-rays, while the mineral matter is comparatively opaque. In this way photographs showing the arrangement of the ash in parallel thin bands may be obtained from a piece of coal about an inch thick when exposed perpendicularly to the planes of bedding; included masses of iron pyrites appear as dark spots. The suggestion has also been made to use this agent as a means of determining the proportion of incombustible matter in coal, the sample being ground to powder and enclosed in a wooden box of a long, tapered wedge form, with a fluorescent screen along one side, which becomes sensitive to the rays passing through a greater or less thickness of the coal wedge in proportion to its freedom from mineral matter. According to Kotte (*Stahl u. Eisen*, vol. xx. p. 392), however, this method is unreliable for quantitative purposes, since for equal contents of ash the permeability varies with the nature of the mineral matter, a small proportion of iron being more effective in increasing the opacity than much larger amounts of the ordinary ash constituents, silica, alumina, &c. Thus for equal total amounts of ash, that containing the least amount of iron, 0·07 per cent., gave the clearest photograph, and that with 5·4 per cent. the worst.

**Development of coal-fields.**

The existence of coal-fields below the secondary strata in the south-east of England, along the line joining the South Wales and Westphalian basins, as inferred by the late Mr Godwin Austen, has of late years been verified by the discovery of carboniferous strata with workable coal seams below the chalk and other secondary formations in the vicinity of Dover, where in 1890 a borehole reached coal at a depth of 1180 feet from the surface, and in a further depth of 1042 feet several seams were subsequently proved of various thicknesses up to 4 feet. In another boring at Ropersole, between Dover and Canterbury, 1774 feet deep, the last 197 feet are in carboniferous strata with two coal seams. In the Dover sinking a bed of oolitic brown iron ore, resembling that of Cleveland and Luxemburg, has been discovered at a depth of 600 feet. Most extensive developments have also been made on the eastern side of the great Midland coal-field, and numerous pits have been sunk through the magnesian limestone and other overlying strata along the whole length of the basin, from Yorkshire to Nottinghamshire. At South Carr, near Gainsborough, in Lincolnshire, the regular succession of the seams in the coal-field has been proved under 1700 feet of New Red Sandstone rocks down to the Barnsley hard coal at 3186 feet, the greatest depth at which coal has as yet been proved in the United Kingdom. It has been suggested that the coal brought up by the trawlers on the fishing bank known as the Coal Pit in the North Sea, 65 miles east of the mouth of the Humber, may be derived from the eastern outcrop of the seams in this basin, which, if this be the case, would be the largest coal-field in Europe.

In the Rhenish Westphalian coal basin, the most important one in Continental Europe, great activity prevails both in exploration and opening of new mines. This is in many respects similar in structure to that of South Wales, a large number of seams, none very thick, being distributed through a great thickness of strata. These are folded transversely into three principal troughs whose axes have a general north-westerly strike, but with the important difference that the carboniferous strata are exposed for only a short distance along the southern margin, the greater part being covered by secondary and tertiary rocks, which increase in thickness rapidly to the north. The newer sinkings have therefore to pass through constantly increasing depths of water-bearing measures, with the result that special methods of overcoming such difficulties have been brought to a high degree of perfection in this region. According to Schultz (*Mittheilungen über den Niederrheinisch-Westfälischen Steinkohlen-Bergbau*, 1901, p. 28) the proved area in 1900 was 1157 square miles, estimated to contain in workable seams:—

| | Tons. |
|---|---|
| Down to 700 metres (2300 feet) | 11,000,000,000 |
| 700 to 1000 metres (3280 feet) | 18,300,000,000 |
| 1000 to 1500 metres (4920 feet) | 25,000,000,000 |
| Total within maximum working depth | 54,300,000,000 |
| At greater depths | 75,000,000,000 |

The development of the coal-fields of the newer mining regions can be best appreciated by the statistical table compiled by Mr B. H. Brough in the *Journal of the Iron and Steel Institute*:—

**Shaft-sinking.**

In putting down new pits, while the methods formerly described are generally followed, much has been done towards accelerating the rate of work. In hard ground for instance, boring machines, supported on radial arms attached to a central pillar, are

substituted for hand labour. Twelve or more holes are bored and charged, and after the removal of the machines and their support to a safe height, are fired either simultaneously or in groups, the boring frame being replaced after the removal of the broken stuff. Much time can also be saved when sinking and walling are carried on simultaneously by the method used in several deep sinkings in South Wales by Professor W. Galloway, where the bricklayers work upon a suspended platform with hinged flaps which completely fill the hollow of the shaft when in use, but can be rapidly shifted by the engine at the surface as the top of the wall rises. One or more central holes are provided with wire-rope guides, to allow of the passage of the bucket bringing up the débris broken by the sinkers. In sinking through soft or water-bearing strata within moderate depths, excavation by hand is practised, the ground being secured with segmented cast-iron tubbing and pumps or water tubs used to keep the bottom dry when the inflow does not exceed 6 or 8 tons of water per minute. Beyond this, the water-cost becomes so great that the Kind and Chaudron system of boring, which has of late years been considerably improved in detail, particularly by the addition of methods for continuously removing the boring detritus, is usually to be preferred. With increase in depth, however, the thickness and weight of the cast-iron tubbing in a large shaft become almost unmanageable; in one instance, at a depth of 1215 feet, the bottom rings in a shaft 14½ feet in diameter are about 4 inches thick, which is about the limit for sound castings. It has therefore been proposed, for greater depths, to put four columns of tubbings of smaller diameters, 8½ and 5½ feet, in the shaft, and fill up the remainder of the boring with concrete, so that with thinner and lighter castings a greater depth may be reached. This, however, has not as yet been tried. Another extremely useful method of sinking through water-bearing ground, introduced by Messrs A. & H. T. Poetsch in 1883, and originally applied to shafts passing through quicksands above brown coal seams, has of late years been applied with advantage in opening new pits through the secondary and tertiary strata above the Coal Measures in the north of France and Belgium, some of the most successful examples being those at Lens, Anzin and Vicq, in the north of France basin. In this system the soft ground or fissured water-bearing rock is rendered temporarily solid by freezing the contained water within a surface a few feet larger in diameter than the size of the finished shaft, so that the ground may be broken either by hand tools or blasting in the same manner as hard rock. The miners are protected by the frozen wall, which may be 4 or 5 feet thick. The freezing is effected by circulating brine (calcium chloride solution) cooled to 5° F. through a series of vertical pipes closed at the bottom, contained in boreholes arranged at equal distances apart around the space to be frozen, and carried down to a short distance below the bottom of the ground to be secured. The chilled brine enters through a central tube of small diameter, passes to the bottom of the outer one and rises through the latter to the surface, each system of tubes being connected above by a ring main with the circulating pumps. The brine is cooled in a tank filled with spiral pipes, in which anhydrous ammonia, previously liquefied by compression, is vaporized *in vacuo* at the atmospheric temperature by the sensible heat of the return-current of brine, whose temperature has been slightly raised in its passage through the circulating tubes. When hard ground is reached, a seat is formed for the cast-iron tubbing, which is built up in the usual way and concreted at the back, a small quantity of caustic soda being sometimes used in mixing the concrete, to prevent freezing. In a recent application of this method at Vicq, near Anzin, two shafts of 12 and 16·4 feet diameter, in a covering of cretaceous strata, were frozen to a depth of 300 feet in fifty days, the actual sinking and lining operations requiring ninety days more. The freezing machines were kept at work for 200 days, and 2191 tons of coal were consumed in supplying steam for the compressors and circulating pumps. In some cases cement concrete has been usefully employed in lining shafts instead of brickwork, a layer about 10 inches thick being much stronger than an equal thickness of brickwork. This is especially applicable to the repair of old shafts, and also to the lining of the excavations for underground pumping engines. Some excellent examples of this method were shown at Paris in 1901 by the Cockerill Company of Seraing. The cement used, as well as the ballast in the concrete, was produced from blast-furnace slags.

***Coal-working at great depths.***

With the increased activity of working characteristic of modern coal mining, the depth of the mines has rapidly increased, and at the present time the level of 4000 feet, formerly assumed as the possible limit for working, has been nearly attained. The following list gives the depths reached in the deepest collieries in Europe in 1900, from which it will be seen that the larger number, as well as the deepest, are in Belgium:—

| | | Metres. | Feet. |
|---|---|---|---|
| Saint Henriette, Cie des Produits, Flenu, | Belgium | 1150 | 3773 |
| Viviers Gilly . . . . . . . | ,, | 1143 | 3750 |
| Marcinelle, No. 11, Charleroi . . . | ,, | 1075 | 3527 |
| Marchienne, No. 2 ,, . . . | ,, | 1065 | 3494 |
| Agrappe, Mons . . . . . . | ,, | 1060 | 3478 |
| Pendleton dip workings . . . | Lancashire | 1059 | 3474 |
| Sacré Madame, Charleroi . . . | Belgium | 1055 | 3461 |
| Ashton Moss dip workings . . . | Lancashire | 1024 | 3360 |
| Ronchamp, No. 11 pit . . . . | France | 1015 | 3330 |
| Viernoy, Anderlues . . . . . | Belgium | 1006 | 3301 |
| Astley Pit, Dukinfield, dip workings . | Cheshire | 960 | 3150 |
| Saint André, Poirier, Charleroi . . | Belgium | 950 | 3117 |

The greatest depth attained in the Westphalian coal at the present time is at East Recklinghausen, where there are two shafts 841 metres (2759 feet) deep.

The subject of the limiting depth of working has been very fully studied in Belgium by Professor Stassart of Mons ("Les Conditions d'exploitation à grande profondeur en Belgique," *Bulletin de la Société de l'Industrie Minérale*, 3 Ser., vol. xiv.), who finds that no special difficulty has been met with in workings above 1100 metres deep from increased temperature or atmospheric pressure. The extreme temperatures in the working faces at 1150 metres were 79 degrees and 86 degrees F., and the maximum in the end of a drift, 100 degrees; and these were quite bearable on account of the energetic ventilation maintained, and the dryness of the air. The yield per man on the working faces was 4·5 tons, and for the whole of the working force underground, 0·846 tons, which is not less than that realized in shallower mines. From the experience of such workings it is considered that 1500 metres would be a possible workable depth, the rock temperature being 132 degrees, and those of the intake and return galleries, 92 degrees and 108 degrees respectively. Under such conditions work would be practically impossible except with very energetic ventilation and dry air. It would be scarcely possible to circulate more than 120,000 to 130,000 cubic feet per minute under such conditions, and the number of working places would thus be restricted, and consequently the output reduced to about 500 tons per shift of ten hours, which could be raised by a single engine at the surface without requiring any very different appliances from those in current use.

Except in modifications of details, no great alterations in the methods of working away coal seams are to be noted, the pillar-and-stall system of removal by two stages and the long-wall or continuous method being representative of all the systems in use. In Europe the tendency is toward the substitution of the latter method wherever possible, but in America pillar-and-stall work in some form is most prevalent. In France and Germany the method of filling the space left by the removal of the coal with waste rock, quarried underground or sent down from the surface, which was originally used in connexion with the working of thick inclined seams by the method of horizontal slices, is now largely extended to long-wall workings on thin seams, and in Westphalia is made compulsory where workings extend below surface buildings, and safety pillars of unwrought coal are found to be insufficient. With careful packing it is estimated that the surface subsidence will not exceed 40 per cent. of the thickness of the seam removed, and will usually be considerably less. The material for filling may be the waste from earlier workings stored in the spoil banks at the surface; where there are blast furnaces in the neighbourhood, granulated slag mixed with earth affords excellent packing. In thick seams packing adds about 5d. per ton to the cost of the coal, but in thinner seams the advantage is on the other side. In America culm and waste are washed into the workings by water, giving a compact mass when the water has drained away.

***Methods of working.***

In securing the roof and sides of coal workings, malleable iron and steel are now used to some extent instead of timber, although the consumption of the latter material is extremely large, the forest areas of Northern Europe and Russia and other countries being laid under contribution, in addition to native woods, to furnish the ever-increasing quantities of pit wood required. As a substitute for timber props at the face, pieces of steel joists, with the web cut out for a short distance on either end, with the flanges turned back to give a square-bearing surface, have been introduced by Mr Firth. In large levels only the cap pieces for the roof are made of steel joists, but in smaller ones complete arches made of pieces of rails fish-jointed at the crown are used. For shaft linings steel rings of H or channel section supported by intermediate struts are also used, and cross-bearers or buntons of steel joists and rail guides are now generally substituted for wood.

***Coal-cutting machines.***

The substitution of machinery for hand labour has been comparatively slow as compared with the changes in other directions, and is by no means general in Europe, although in America the progress has been considerable, especially since the systematic introduction of electric power underground. Of the earlier types, those with a swinging pick, imitating the action of a miner in undercutting, represented by the machines of Firth & Donisthorpe and Jones & Levick, have been superseded by those of the circular or chain saw types, to which have been added others with percussive and rotatory drill cutters. In the North of England and Midland districts the circular-saw type, cutting in a horizontal plane at or near the ground-level, is largely used, one of the best known being the Diamond coal-cutter of Mr W. Garforth, which is similar in construction to Winstanly & Barker's machine (vol. vi. Fig. 14, p. 68), but cuts to a depth of 5½ or 6 feet. The Baird type of chain-saw machine, working round a fixed over-hanging frame, is still used in Scotland, and a modified form adapted for electric driving has been lately proposed by Mr E. K. Scott (*Proc. Inst. Civ. Eng.* vol. cxliv. p. 247). In the United States percussive and chain-saw machines are used almost exclusively. The former of these are represented by the Harrison, Sullivan, & Ingersoll-Sergeant machines, which are essentially large rock-drills without turning gear for the cutting tool, and mounted upon a pair of wheels placed so as to allow the tool to work on a forward slope. When in use the machine is placed upon a wooden platform inclining towards the face, upon which the miner lies and controls the direction of the blow by a pair of handles at the back of the machine, which is kept stationary by wedging the wheels against a stop on the platform. These machines, which are driven by compressed air, are very handy in use, as the height and direction of the cut may be readily varied; but the work is rather severe to the driver on account of the recoil shock of the piston, and an assistant is necessary to clear out the small coal from the cut, which limits the rate of cutting to about 125 square feet per hour. The chain machines represented by the Jeffrey, Link-Belt, and Morgan-Gardner coal-cutters are similar in principle to the Baird machine, the cutting agent being a flat link chain carrying a double set of chisel points, which are drawn across the coal face at the rate of about 5 feet per second; but, unlike the older machines, in which the cutting is done in a fixed plane, the chain with its motor is made movable, and is fed forward by a rack-and-pinion motion as the cutting advances, so that the cut is limited in breadth (3½ to 4 feet), while its depth may be varied up to the maximum travel (8 feet) of the cutting frame. The carrying frame, while the work is going on, is fixed in position by jack-screws bearing against the roof of the seam, which, when the cut is completed, are withdrawn, and the machine shifted laterally through a distance equal to the breadth of the cut and fixed in position again. The whole operation requires from 8 to 10 minutes, giving a cutting speed of 120 to 150 square feet per hour. These machines weigh from 20 to 22 cwt., and are mostly driven by electric motors of 25 up to 35 H.P. as a maximum. By reason of their intermittent action they are only suited for use in driving galleries or in pillar-and-stall workings. The saving effected by the substitution of machines for hand coal-cutting in English Midland collieries varies from about 9·75d. to 21d. per ton, about two-thirds of this being due to the smaller fall of slack as compared with that produced in hand driving. In America the saving is less apparent, owing to the increased wages demanded by the drivers and assistants, and the principal advantage is in the increased rate of production, which is from 6 to 7 tons daily per man underground, instead of 3 to 4 tons with hand work. In 1898, 25·3 per cent. of the output of Pennsylvania (15 out of 59 million tons) was obtained by machine cutting, which was exclusively confined to the bituminous coal district; the coal in the anthracite districts is too hard and the seams too much disturbed to allow the cutting to be done except by hand.

***Ventilation and lighting.***

In new mines the ventilation is now generally effected by an exhausting fan, the old system of ventilating furnaces being almost obsolete. The large slow-going fan of the Guibal type still maintains its character for efficiency, although the tendency is towards using smaller and more rapidly-driven machines; and the heavy casings and chimneys in brickwork are generally giving way to lighter structures in sheet-iron. Fans with curved instead of flat blades, and with spiral diffusers resembling turbines, are now largely used, that of M. Rateau being specially popular with Continental colliery engineers, on account of its high mechanical efficiency. The use of small auxiliary blowing ventilators underground, for carrying air into workings away from the main circuits, which was largely advocated a few years since, has lost its popularity, but a useful substitute has

been found in the induced draught produced by jets of compressed air or high-pressure water blowing into ejectors. With a jet of $\frac{1}{200}$-inch area, a pipe discharging $1\frac{2}{3}$ gallon of water per minute at 165 ℔ pressure per square inch, a circulation of 850 cubic feet of air per minute was produced at the end of a level, or about five times that obtained from an equal volume of air at 60 ℔ pressure. The increased resistance, due to the large extension of workings from single pairs of shafts, the ventilating currents having often to travel several miles to the upcast, has led to great increase in the size and power of ventilating fans, and engines from 250 to 500 H.P. are not uncommonly used for such purposes. Electric driving from central-power stations has been found to be well suited for this particular use.

The numerous forms of safety-lamps employed in fiery mines have received several additions in late years, and old forms have been improved and modified to meet the requirements of safety in air-currents travelling at a high velocity. Prominent among the new forms is the Hepplewhite-Gray lamp, which has a conical glass surrounding the light, with a gauze chimney, protected by an outer metal cylinder; the air supply to the flame is carried downwards through three tubes forming the standards of the cage. This, in addition to giving a good light overhead owing to the shape of the glass, is peculiarly sensitive to gas, and therefore valuable in testing for fire-damp. Other approved lamps are the Deflector and those of Marsaut & Mueseler when specially bonneted to resist extra high-speed currents. The illuminant now generally used in Great Britain is a mixture of rape oil with half its volume of petroleum, which is more suitable than vegetable or animal oil alone. In Germany Wolf's lamp, burning benzoline or petroleum spirit upon an asbestos wick, is very popular, as giving a much better light than oil. Special care is, however, required in filling, so that no free liquid may be left in the holder; the spirit must be entirely absorbed by a filling of sponge, and any superfluous quantity poured off. Portable electric lamps, supplied by accumulators or dry batteries, have been introduced into coal-mines; but owing to the weight and cost, their use is as yet very restricted. For the use of exploring parties after explosions, where irrespirable gases are encountered and compressed air or oxygen must be carried, they are especially valuable, as light is obtained without any demand on the air supply. Fire-damp, when present in the air, lengthens the flame of an ordinary safety-lamp, but the effect is not apparent with less than about $2\frac{1}{2}$ per cent. of gas; and for more delicate testing, special lamps with non-luminous flames are adopted. In Pieler's lamp, which is of the ordinary Davy form, alcohol is burned on a silk wick, and a screen is provided so that the flame can be hidden. When exposed in air containing $\frac{1}{4}$ per cent., a cap of $1\frac{1}{8}$ inch is formed, which increases to 2 inches with $\frac{1}{2}$ per cent., and with $1\frac{1}{4}$ per cent. the lamp is filled with a deep blue glow. Another and more useful method is that of Dr. F. Clowes, who uses a hydrogen flame 0·4 inch long, obtained by attaching a cylinder containing compressed hydrogen to an ordinary safety-lamp; the gas is turned into the oil flame, which is for the time extinguished, and relighted when the observation is finished. As little as 0·2 per cent. of gas can be detected by this method.

*Coal dust.*

The danger arising from the presence of coal dust in the air of dry mines, with or without the addition of fire-damp, has, since it was first pointed out by Professor W. Galloway, been made the subject of special inquiries in the principal European countries interested in coal mining; and although certain points are still debatable, the fact is generally admitted as one calling for special precautions. The conclusions arrived at by the Royal Commission of 1891, which may be taken as generally representative of the views of British colliery engineers, are as follows:—

1. The danger of explosion when gas exists in very small quantities is greatly increased by the presence of coal dust.
2. A gas explosion in a fiery mine may be intensified or indefinitely propagated by the dust raised by the explosion itself.
3. Coal dust alone, without any gas, may cause a dangerous explosion if ignited by a blown-out shot; but such cases are likely to be exceptional.
4. The inflammability of coal dust varies with different coals, but none can be said to be entirely free from risk.
5. There is no probability of a dangerous explosion being produced by the ignition of coal dust by a naked light or ordinary flame.

Danger arising from coal dust is best guarded against by systematically sprinkling or watering the main roads leading from the working faces to the shaft, where the dust falling from the trams in transit is liable to accumulate. This may be done by water-carts or hose and jet, but preferably by finely divided water and compressed air distributed from a network of pipes carried through the workings. This is now generally done, and in some countries is compulsory, when the rocks are deficient in natural moisture. According to Behrens, the quantity of water required to keep down the dust in a mine raising 850 tons of coal in a single shift was 28·8 tons, apart from that required by the jets and motors. The distributing network extended to more than 30 miles of pipes, varying from $3\frac{1}{2}$ inches to 1 inch in diameter.

*Safety explosives.*

In all British coal-mines, when gas in dangerous quantities has appeared within three months, and in all places that are dry and dusty, blasting is prohibited, except with permitted explosives, whose composition and properties have been examined at the testing station at the Royal Arsenal, Woolwich. A list of those sanctioned is published by the Home Office. They are mostly distinguished by special trade names, and are mainly of two classes—those containing ammonium nitrate and nitro-benzole or nitro-naphthalene, and those containing nitro-glycerine and nitro-cellulose, which are essentially weak dynamites. The safety property attributed to them is due to the depression of the temperature of the flame or products of explosion to a point below that necessary to ignite fire-damp or coal dust in air from a blown-out shot. New explosives that are found to be satisfactory when tested are added to the list from time to time, the composition being stated in all cases.

*Pumping.*

The most noticeable feature in the arrangements for draining modern collieries is the general abandonment of surface engines, with heavy wooden or iron rods in the shaft, in favour of high-speed engines placed underground, and supplied with power either by steam sent down from the surface, or in a less direct manner by water circulating under high pressure or by electric transmission. Compressed air may also be used, but is mostly restricted to small installations, on account of its low mechanical efficiency. The earlier underground steam-pumps were very wasteful machines, on account of the low steam pressures available and the loss by condensation in the steam conduit pipes, but with improvements in construction and the adoption of multiple expansion in several cylinders with high initial steam pressure, the fuel consumption has been reduced nearly to the level of that of good surface or marine engines. Several engines of this class of considerable size have been erected in the deep Westphalian pits, *e.g.*, one of 1900 to 2000 H.P., lifting a maximum quantity of 17 tons of water per minute 1300 feet high, with an expenditure of

$10\frac{1}{2}$ to 11 tons of steam at 180 ℔ pressure per hour, the loss by condensation in the steam supply pipe, which is rather more than a quarter of a mile long, being only 12 cwt. per hour. The engines are of the four-cylinder triple expansion class in twin tandem form. A still larger example of the same kind, now under construction for the Harpen Collieries, is intended for a maximum duty of 25 tons of water raised 1640 feet per minute, representing about 3500 H.P. Probably the heaviest existing colliery pumping plant is that at the Miike Colliery in Japan, which has a capacity of 40·3 tons per minute lifted 900 feet. This is done by four Davy compound engines placed side by side at the surface, each working two lines of rods in the shaft, which is of the unusual size of 40 by 12 feet. In the indirect system of hydraulic transmission a steam-engine at the surface pumps water continuously into a system of pipes against a resistance of 2500 to 3000 ℔ per square inch, and the pressure so obtained drives a pump underground through a pipe carried down the shaft, the water returning by another pipe to the surface engine in a continuous circuit. This system, originally used as a method of transmitting small power underground by Messrs West & Darlington in Cornwall, and since developed to a high degree by Mr R. Moore, Mr H. Davey, Messrs Kaselowsky & Prott, and other hydraulic engineers, has many advantages, particularly in the small dimension of the engines, which require much smaller walled chambers in the mine than steam-engines of similar power; but great care is required to keep the driving water perfectly clean, to prevent wear on the valves, as on account of the high pressure employed a very small leakage gives rise to a large waste of power. Engines of this class are made in a great variety of forms, both reciprocating with long stroke, and rotating with short stroke high speed pumps. The largest class in use forces 7 tons per minute 2000 to 2300 feet high. Pumping by electric transmission, although of comparatively recent introduction, has taken up a leading position in deep mining, and probably will be almost exclusively used at no very distant date. At first it was mainly applied to small special purposes, such us raising feeders of water from isolated workings to a main pumping engine, but now large self-contained installations, with generating dynamos from 800 to 1000 H.P., are in use. In the largest plant of this class, intended for a maximum duty of 15 tons per minute lifted 1260 feet, three compound engines of 750 H.P. are provided, each driving its pump by a separate generator and motor by an alternating current of 2000 volts. Under ordinary conditions the water charge in coal mining is considerable, and in old mines with a large extent of open workings it becomes very burdensome, the weight of water to be lifted being often many times that of the coal produced. In the Westphalian coal-field in 1899, 169·5 million tons of water were lifted for an output of 55 million tons of coal, or rather more than 3 tons to 1 ton of coal. In the older and partly worked-out districts the proportion rises to as much as 8 to 1. In South Staffordshire, where the ground is honeycombed with old thick coal workings, from 24 to $28\frac{1}{2}$ tons of water per ton of coal raised were pumped in 1898.

***Winding from deep mines.***

The principal improvements in the hoisting arrangements of modern colliery plants have been in the direction of larger engine power, and arrangements for loading and discharging the cages with the smallest loss of time. Where deep cages, carrying from four to six tiers of tubs superposed, are employed, Fowler's hydraulic arrangement, using auxiliary cages upon hydraulic lifts at the surface and pit bottom (*Ency. Brit.* vol. vi. p. 76), is one of the best devices for the latter purpose. It has been lately extended by Tomson to six- and eight-decked cages. In another arrangement by Darphin the cage is received at the surface by hydraulic keeps, which support it at its highest level and progressively lower it to bring each deck in succession down to the landing place, when the loaded tubs are run out and replaced by empty ones without moving the main engine. The time occupied in landing and changing the load of twelve tubs is from 20 to 25 seconds. Many improvements have been made in the construction of winding engines of late years, in order to reduce the consumption of steam, by the adoption of variable expansion gear, and the substitution of compound for single engines. The two-cylinder compound engine has been used in some cases, but a preferable form is the twin tandem compound adopted by Mr W. Galloway at Llanbradach in 1894, and since introduced into many of the deep pits in France and Germany. The steam is exhausted into a central condenser, where a permanent vacuum is maintained, as the intermittent nature of the work prevents the use of a separate condenser.

In very deep mines the moment of the load at different points of the lift varies considerably when a cylindrical drum is used, and becomes negative during the last part of the lift, owing to the excess weight of the rope on the descending side. In order to keep the work of the engines more nearly constant, various systems of counterbalancing by auxiliary chains, &c., have been adopted, as previously described. In addition to these, Koepe's method of winding has of late years obtained some favour. In this system the drum is replaced by a disc with a grooved rim for the rope, which passes from the top of one cage over the guide pulley, round the disc, and back over the second guide to the second cage, and a tail rope, passing round a pulley at the bottom of the shaft, connects the bottoms of the cages, so that the dead weight of cage, tubs, and rope is completely counterbalanced at all positions of the cages, and the work of the engine is confined to the useful weight of coal raised. Motion is communicated to the rope by frictional contact with the drum, which is covered through about one-half of the circumference. This system was used for some time at Bestwood, in Nottinghamshire, and is still employed at Sneyd, in North Staffordshire. In Belgium it was tried in a pit 940 metres deep, but has since been replaced by flat hempen ropes, and is now restricted to shallower workings at 250 metres. In Westphalia it is applied in about thirty different pits to a maximum depth of 761 metres. The system of counterbalancing by the use of spiral drums is limited by their excessive size and weight when both ropes wind on the same drum. This has to some extent been met by Tomson's modification, where a separate conical drum is used for each rope. They are mounted upon parallel axes, but turned in opposite directions, the base of one towards the point of the other. In this way the weight and breadth of the drum is notably diminished, but the engine is complicated by the addition of a rocking beam and additional coupling rod for working the second drum. An engine of this kind has been in use since 1896 at Preussen Colliery, Westphalia, and has also been adopted for the 1015-metre pits at Ronchamp, in France.

As regards the form and material of winding ropes, while round ropes of steel wire of high tensile strength and tapered in thickness for great depths are generally preferred in England and Germany, opinion in Belgium, and to some extent in the north of France, favours the use of flat ropes made of "aloes" or Manilla hemp, really plantain fibre. Those in deep pits are of considerable size and weight, *e.g.*, tapering from 15·6 inches to 9 inches in breadth and 2 inches to $1\frac{1}{8}$ inch in thickness, and weighing 14·3

tons per 1200 metres. Stassart (*loc. cit.* p. 465) considers that they should be used in preference to flat steel wire ropes down to 1500 metres. The new large engine of the Anzi Company, to lift a gross load of 15 tons from 750 metres, is also fitted with flat ropes. These are 3 inches thick and $22\frac{1}{2}$ inches broad at the drum end, weigh 18 tons each, and coil upon a diameter increasing from 14 to 26·3 feet.

The continuous change in direction experienced by the rope between the head-gear pulley and the drum in coiling on or off (the so-called "angling" of the rope) is a source of wear when the depth becomes considerable. This is to some extent diminished by placing the engine at some distance from the pit, up to 50 or 60 yards; but a complete remedy has been proposed by Mr W. Morgan, who uses a winding engine upon a frame carried upon two lines of railway, which is shifted laterally though a distance equal to the thickness of the rope at each revolution of the drum, so that the end of the coil is always in the same vertical plane with the guide pulley and the cage. The first engine of this class has just been erected at Dolcoath tin mine in Cornwall, at a shaft which is to be carried down to 3000 feet in depth.

In the United Kingdom the drawing of coal is generally confined to the day shift of eight or ten hours, with an output of 100 to 150 tons per hour, according to the depth, capacity of coal tubs, and facilities for landing and changing tubs. With Fowler's hydraulic arrangement 2000 tons are raised 600 yards in eight hours. In the deeper German pits, where great thicknesses of water-bearing strata have to be traversed, the first establishment expenses are so great that in order to increase output the shaft is sometimes provided with a complete double equipment of cages and engines. In such cases the engines may be placed in line on opposite sides of the pit, or at right angles to each other. According to Köhne, the output of single shafts has been raised by this method to 3500 and 4500 tons in the double shift of sixteen hours. It is particularly well suited to mines where groups of seams at different depths are worked simultaneously. Some characteristic figures of the yield for British collieries in 1898 are given below:—

| | |
|---|---|
| Albion Colliery, South Wales | 551,000 tons in a year for one shaft and one engine. |
| Silksworth Colliery, Northumberland | 535,000 tons in a year for shaft 580 yards deep, two engines. |
| Bolsover Colliery, Derby | 598,798 tons in 279 days, shaft 365 yards deep. |
| Denaby Main Colliery, Yorkshire | 629,947 tons in 281 days, maximum per day 2673 tons. |

***Surface arrangements.***

Coal as raised from the pit is now generally subjected to some final process of classification and cleaning before being despatched to the consumer. The nature and extent of these operations vary with the character of the coal, which if hard and free from shale partings may be finished by simple screening into large and nut sizes and smaller slack or duff, with a final hand-picking to remove shale and dust from the larger sizes. But when there is much small duff, with intermixed shale, more elaborate sizing and washing plant becomes necessary. Where hand-picking is done, the larger-sized coal, separated by 3-inch bar screens, is spread out on a travelling band, which may be 300 feet long and from 3 to 5 wide, and carried past a line of pickers stationed along one side, who take out and remove the waste as it passes by, leaving the clean coal on the belt. The smaller duff is separated by vibrating or rotating screens into a great number of sizes, which are cleaned by washing in continuous-current or pulsating jigging machines, where the lighter coal rises to the surface and is removed by a stream of water, while the heavier waste falls and is discharged at a lower level, or through a valve at the bottom of the machine. The larger or "nut" sizes, from $\frac{1}{4}$ inch upwards, are washed on plain sieve plates, but for finer-grained duff the sieve is covered with a bed of broken felspar lumps about 3 inches thick, forming a kind of filter, through which the fine dirt passes to the bottom of the hutch. The cleaned coal is carried by a stream of water to a bucket elevator and delivered to the storage bunkers, or both water and coal may be lifted by a centrifugal pump into a large cylindrical tank, where the water drains away, leaving the coal sufficiently dry for use. Modern screening and washing plants, especially when the small coal forms a considerable proportion of the output, are large and costly, requiring machinery of a capacity of 100 to 150 tons per hour, which absorbs 350 to 400 horse-power. In this, as in many other cases, electric motors supplied from a central station are now preferred to separate steam-engines.

***Briquettes.***

In addition to its use as fuel, there are two principal outlets for small coal, namely, as briquettes, or patent fuel, and coke, the former being adopted for non-caking and the latter for caking coals. For briquettes the small coal, if previously washed, is dried to reduce the moisture to at most 4 per cent., and, if necessary, crushed in a disintegrator and incorporated in a pug mill with from 8 to 10 per cent. of gas pitch, softened by heating to between 70° and 90° C. to a plastic mass, which is then moulded into blocks and compacted by a pressure of $\frac{1}{2}$ to 2 tons per square inch in a machine with a rotating die plate somewhat like that used in making semi-plastic clay bricks. When cold, the briquettes, usually weighing from 7 to 20 ℔ each, although smaller sizes are made for domestic use, become quite hard, and can be handled with less breakage than the original coal. Their principal use is as fuel for marine and locomotive boilers, the evaporative value being about the same or somewhat more than that of coal. The principal seat of the manufacture in Great Britain is in South Wales, where the dust and smalls resulting from the handling of the best steam coals (which are very brittle) is obtainable in large quantities and finds no other use. Some varieties of lignite, when crushed and pressed at a steam heat, soften sufficiently to furnish compact briquettes without requiring any cementing material. These are now made to a very large extent from the tertiary lignites in the vicinity of Cologne, and are used mainly for house fuel on the Lower Rhine and in Holland.

***Coke-making.***

The principal novelty of interest in connexion with coke-making is the development of the so-called by-product ovens, where, in addition to the carbonized fuel, volatile products, such as tar, benzol, and ammonia, are recovered by condensation from the gases evolved in the oven before the latter are burnt to supply the necessary heat for the coking process. The first successful application of this principle was made by Mr Carvès at Besseges, in France, and it was introduced into Great Britain, with some modifications in details, by the late Mr H. Simon, under the name of the Simon-Carvès system. Other and subsequent developments were those of Semet-Solvay and Hüssener. The whole of these have a common feature in the narrow ∩-shaped oven, which is heated by a series of parallel horizontal flues in the side walls, while in the Otto-Hoffmann system, which has been most largely adopted, the Coppée oven with vertical heating flues is used. The condensing arrangements, which are generally similar for all the systems, resemble those of an ordinary gas-works, somewhat simplified. The gas given off by the coal is led by one or two openings in the roof, through water-sealed dip pipes, to a collecting main leading to a system of atmospheric condensers, pipes cooled by exposure

to the air, where its temperature is reduced, and the tar is condensed and removed. The flow of gas is maintained by rotating exhausters, which force it forward through a series of scrubber towers, where the ammonia vapour is separated by a graduated system of washing with water and ammoniacal liquor. The final removal of benzol is effected by washing the partially purified gas with creosote oil. When the condensible products are removed, the gas is returned by a common supply pipe for distribution to the heating flues of the ovens. In the Otto-Hoffmann oven of the earlier and most generally used form, the gas is fired with heated air in a horizontal flue running along the bottom of the coking chamber; this is divided into two parts by a partition in the middle of its length, and the flame rises through the vertical side passages of the first half of the oven to two horizontal collectors at the top, where the direction being reversed, it passes downwards along the second half to the chimney, after giving up some of the surplus heat to a Siemens regenerator, in which the air for combustion is heated after the next reversal. The gas supply is introduced alternately from the front and back of the oven, there being a regenerator for air-heating at either end. In the newer form of this oven the air regenerators and reversal of the flame have been abandoned in favour of a system of continuous heating, the gas distributed by pipes in a chamber below the bottom of the oven supplying a series of large Bunsen burners at equal distances apart along the bottom, whose flames pass continuously upward through the side flues. There is some difference of opinion as to the merits of the two forms, but the new system is generally held to give more uniform heating, as well as being simpler in construction. In the horizontally-heated ovens the flues are arranged as parallel superposed passages along the length of the wall. The gas entering the lowest one is fired, and passes four times backwards and forwards to the chimney flue. This is usually of thin brickwork, so that a portion of the waste heat is transmitted to the air supplied for combustion, which passes in the opposite direction through adjacent parallel flues in the brickwork of the foundation, forming a continuous "recuperator," as distinguished from the intermittent Siemens regenerator.

The time of coking in retort ovens varies with the quality of the coal and size of the charge, which may be from $5\frac{1}{2}$ to 7 tons, about thirty-six hours being required in the newer kinds. The coke produced is not so dense or brilliant as that made in beehive ovens, but the waste being less, there is a decided saving, apart from the value of the condensed products. In one instance the coke was found to be about 5 per cent. less efficient in the blast furnace, while the yield was increased 10 per cent. In the further treatment of the condensed products by distillation the tar gives burning oil and pitch, the benzol is separated from the creosote oil by steam-heated stills, and the ammoniacal liquor, after some lime has been added to decompose fixed ammonium compounds, is heated to vaporize the ammonia, which is condensed in lead or copper lined tanks containing strong sulphuric acid to produce a crystalline powder of ammonium sulphate, which accumulates in the receiver and is fished out from time to time. The yield of by-products averages about 1 per cent. of sulphate of ammonium, about $3\frac{1}{2}$ per cent. of tar, and 0·6 to 0·9 per cent. of benzol of the weight of the coal carbonized. Besides heating the ovens and supplying steam for the machinery of the condensing plant and the coke ovens, there is usually a considerable surplus of gas, which may be used for lighting or driving gas-engines. For the latter purpose, however, it is necessary to remove the last traces of tar, which acts very prejudicially in fouling the valves when the gas is not completely purified.

REFERENCES.—Most of the detailed information concerning improvements in the practice of coal mining and the improvement in plant and machinery is contained in the published proceedings of the different professional societies, including the *Transactions* of the Institution of Mining Engineers, the South Wales Institute of Engineers, the British Society of Mining Students, and the American Institute of Mining Engineers. Among special works dealing with modern practice, Professor Galloway's lectures (published by the South Wales Institute, Cardiff, 1900), and the larger *Text-Book on Coal Mining*, by Mr H. W. Hughes (fourth edition, London, 1901), are the most notable, the latter being especially valuable for the detailed classified list of original authorities given at the end of each chapter. Very complete references are also given in the systematic abstracts published in the half-yearly volumes of the *Journal of the Iron and Steel Institute*. (H. B.)

**Coaling Stations.**—Maritime war in all ages has required that the ships of the belligerents should have the use of sheltered waters for repairs and for replenishment of supplies. The operations of commerce from the earliest days demanded natural harbours, round which, as in the conspicuous instance of Syracuse, large populations gathered. Such points, where wealth and resources of all kinds accumulated, became objects of attack, and great efforts were expended upon their capture. As maritime operations extended, the importance of a seaboard increased, and the possession of good natural harbours became more and more advantageous. At the same time, the growing size of ships and the complexity of fitments caused by the development of the sailing art, imposed new demands upon the equipment of ports alike for purposes of construction and for repairs; while the differentiation between warships and the commercial marine led to the establishment of naval bases and dockyards provided with special resources. From the days when the great sailors of Elizabeth carried war into distant seas, remote harbours began to assume naval importance. Expeditionary forces required temporary bases, such as Guantanamo Bay, in Cuba, which was so utilized by Admiral Vernon in 1741. As outlying territories began to be occupied, and jurisdiction to be exercised over their ports, the harbours available for the free use of a belligerent were gradually reduced in number, and it became occasionally necessary to take them by force. Thus, in 1782, the capture of Trincomalee was an object of sufficient importance to justify special effort, and Suffren gained a much-needed refuge for his ships, at the same time compelling his opponent to depend upon the open roadstead of Madras, and even to send ships to Bombay. In this case a distant harbour acquired strategic importance, mainly because sheltered waters, in the seas where Hughes and Suffren strove for naval supremacy, were few and far between. A sailing man-of-war usually carried from five to six months' provisions and water for 100 to 120 days. Other needs required to be met, and during the wars of the French Revolution it was usual, when possible, to allow ships engaged in blockade to return to port every five or six weeks "to refresh." For a sailing fleet acting on the offensive, a port from which it could easily get to sea was a great advantage. Thus Raleigh protested against the use of closely landlocked harbours. "Certain it is," he wrote, "that these ships are purposely to serve His Majesty and to defend the kingdom from danger, and not to to be so penned up from casualitie as that they should be less able or serviceable in times of need." Nelson for this reason made great use of Maddalena Bay, in Sardinia, and was not greatly impressed with the strategic value of Malta in spite of its fine natural harbour. The introduction of steam gave rise to a new naval requirement—coal—which soon became vital. Commerce under steam quickly settled down upon fixed routes, and depots of coal were established to meet its needs. Coaling stations thus came into existence by a natural process, arising from the exi-

gencies of trade, and began later to supply the needs of navies.

For many years there was no inquiry into the war requirements of the British fleet as regards coal, and no attempt to regularize or to fortify the ports at which it was stored. Successful naval war had won for Great Britain many points of vantage throughout the world, and in some cases the strategic value of ports had been proved by actual experience. The extreme importance of the Cape of Good Hope, obscured for a time after the opening of the Suez Canal, was fully realized in sailing days, and the naval conditions of those days to some extent determined the choice of islands and harbours for occupation. There does not, however, appear to have been any careful study of relative strategic values. Treaties were occasionally drafted by persons whose geographical knowledge was at fault, and positions were, in some cases, abandoned which ought to have been retained, or tenaciously held when they might have been abandoned. It was left to the personal exertions of Sir Stamford Raffles to secure such a supremely important roadstead as that of Singapore for the empire. Although, therefore, the relative values of positions was not always recognized, Great Britain obtained as a legacy from sailing days a large number of harbours admirably adapted for use as coaling stations. Since the dawn of the era of steam, she has acquired Aden, Perim, Hong Kong, North Borneo, Fiji, part of New Guinea, Fanning Island, and many other islands in the Pacific, while the striking development of Australia and New Zealand has added to the long roll of British ports. The coaling stations, actual and potential, of the empire are unrivalled in number, in convenience of geographical distribution, and in resources. Of the numerous British ports abroad which contained coal stores, only the four so-called "fortresses"—Gibraltar, Malta, Halifax, and Bermuda—were at first fortified as naval stations after the introduction of rifled ordnance. The term fortress is a misnomer in every case except Gibraltar, which, being a peninsula separated only by a neck of neutral ground from the territory of a foreign Power, exists under fortress conditions. Large sums were expended on these places with little regard to principles, and the defences of Bermuda, which were very slowly constructed, are monuments of misapplied ingenuity.

***British coaling stations.***

In 1878 great alarm arose from strained relations with Russia. Rumours of the presence of Russian cruisers in many waters, and of hostile projects, were readily believed, although the Russian navy, which had just shown itself unable to face that of Turkey, would at this period have been practically powerless. Widespread fears for the security of coaling stations led to the appointment of a strong royal commission, under the presidency of the earl of Carnarvon, which was instructed to inquire into and report upon the protection of British commerce at sea. This was the first attempt to formulate any principles, or to determine which of the many ports where coal was stored should be treated as coaling stations essential for the purposes of war. The terms of the reference to the commission were ill-conceived. The basis of all defence of sea-borne commerce is a mobile navy. It is the movement of commerce upon the sea during war, not its security in port, that is essential to the British Empire, and a navy able to protect commerce at sea must evidently protect ports and coaling stations. The first object of inquiry should, therefore, have been to lay down the necessary standard of naval force. The vital question of the navy was not referred to the royal commission, and the four fortresses were also strangely excluded from its purview. It followed inevitably that the protection of commerce was approached at the wrong end, and that the labours of the commission were to a great extent vitiated by the elimination of the principal factor. Voluminous and important evidence, which has not been made public, was, however, accumulated, and the final report was completed in 1881. The commissioners recalled attention to the extreme importance of the Cape route to the East; they carefully examined the main maritime communications of the empire, and the distribution of trade upon each; they selected certain harbours for defence, and they obtained from the War Office and endorsed projects of fortification in every case; lastly, they condemned the great dispersion of troops in the West Indies, which had arisen in days when it was a political object to keep the standing army out of sight of the British people, and had since been maintained by pure inadvertence. Although the principal outcome of the careful inquiries of the commission was to initiate a great system of passive defence, the able reports were a distinct gain. Some principles were at last formulated by authority, and the information collected, if it had been rendered accessible to the public, would have exercised a beneficial influence upon opinion. Moreover, the commissioners, overstepping the bounds of their charter, delivered a wise and statesmanlike warning as to the position of the navy.

***Carnarvon Commission.***

Meanwhile, the impulse of the fears of 1878 caused indifferent armaments to be sent to Cape Town, Singapore, and Hong Kong, there to be mounted after much delay in roughly designed works. At the same time, the great colonies of Australasia began to set about the defence of their ports with commendable earnestness. There is no machinery for giving effect to the recommendations of a royal commission, and until 1887, when extracts were laid before the first colonial Conference, the valuable report was veiled in secrecy. After several years, during which Lord Carnarvon persistently endeavoured to direct attention to the coaling stations, the work was begun. In 1885 a fresh panic arose out of the Panjdeh difficulty, which supplied an impetus to the belated proceedings. Little had then been accomplished, and the works were scarcely completed before the introduction of long breech-loading guns rendered their armaments obsolete.

The fortification of the coaling stations for the British Empire is still proceeding on a scale which, in some cases, cannot easily be reconciled with the principles laid down by the president of the Cabinet committee of defence. At the Guildhall, London, on 3rd December 1896, the duke of Devonshire stated that "The maintenance of sea supremacy has been assumed as the basis of the system of imperial defence against attack from over the sea. This is the determining factor in fixing the whole defensive policy of the empire." It was, however, he added, necessary to provide against "the predatory raids of cruisers"; but "it is in the highest degree improbable that this raiding attack would be made by more than a few ships, nor could it be of any permanent effect unless troops were landed." This is an unexceptionable statement of the requirements of passive defence in the case of the coaling stations of the British Empire. Their protection must depend primarily on the navy. Their immobile armaments are needed to ward off a raiding attack, and a few effective guns, well mounted, manned by well-trained men, and kept in full readiness, will amply suffice.

If the command of the sea is lost, large expeditionary forces can be brought to bear upon coaling stations, and their security will thus depend upon their mobile garrisons, not upon their passive defences. In any case, where coal is stored on shore, it cannot be destroyed by the fire of a ship, and it can only be appropriated by landing men. A small force, well armed and well handled, can effectually prevent a raid of this nature without any assistance from heavy guns. In war, the possession of secure coal stores in distant ports may be a great advantage, but it will rarely suffice for the needs of a fleet engaged in offensive operations, and requiring to be accompanied or met at prearranged rendezvous by colliers from which coal can be transferred in any sheltered waters. In the British naval manœuvres of 1892, Admiral Sir Michael Seymour succeeded in coaling his squadron at sea, and by the aid of mechanical appliances this is frequently possible. In the Spanish-American war of 1898 some coaling was thus accomplished; but Guantanamo Bay served the purpose of a coaling station during the operations against Santiago. Watering at sea was usually carried out by means of casks in sailing days, and must have been almost as difficult as coaling. As, however, it is certainty of coaling in a given time that is of primary importance, the utilization of sheltered waters as improvised coaling stations is sure to be a marked feature of future naval wars. Although coaling stations are now eagerly sought for by all Powers which cherish naval ambitions, the annexation of the Sandwich Islands by the United States being a case in point, it is probable that they will play a somewhat less important part than has been assumed. A fleet which is able to assert and to maintain the command of the sea, will not find great difficulty in its coal supply. Moreover, the increased coal endurance of ships of war tends to make their necessary replenishment less frequent. On the other hand, the modern warship, being entirely dependent upon a mass of complex machinery, requires the assistance of workshops to maintain her continuous efficiency, and unless docked at intervals suffers a material reduction of speed. Prolonged operations in waters far distant from home bases will therefore be greatly facilitated in the case of the Power which possesses local docks and means of

***Modern conditions.***

executing repairs. Injuries received in action, which might otherwise disable a ship during a campaign, may thus be remedied. During the hostilities between France and China in 1884 the French ship *La Galissonnière* was struck by a shell from one of the Min forts, which, though failing to burst, inflicted serious damage. As, by a technical fiction, a state of war was not considered to exist, the *La Galissonnière* was repaired at Hong Kong and enabled again to take the sea. Local stores of reserve ammunition and of spare armaments confer evident advantages. Thus, independently of the question of coal supply, modern fleets employed at great distances from their bases require the assistance of ports furnished with special resources, and a Power like Japan with well-equipped naval bases in the China Sea, and possessing large sources of coal, occupies, for that reason, a favoured position in regard to naval operations in the Far East. As the term "coaling station" refers only to a naval need which can often be satisfied without a visit to any port, it appears less suitable to modern conditions than "secondary base." Secondary bases, or coaling stations, when associated with a powerful mobile navy, are sources of maritime strength in proportion to the services they can render, and to their convenience of geographical position. In the hands of an inferior naval Power, they may be used, as was Mauritius in 1809–10, as points from which to carry on operations against commerce; but unless situated near to trade routes, which must be followed in war, they are probably less useful for this purpose than in sailing days, since convoys can now be more effectively protected, and steamers have considerable latitude of courses. Isolated ports dependent on sea-borne resources, and without strong bodies of organized fighting men at their backs are now, as always, hostages offered to the Power which obtains command of the sea. (G. S. C.)

*Secondary bases.*

**Coatbridge,** a municipal burgh (since 1885) of Lanarkshire, Scotland, about 9 miles east of Glasgow by rail. The surrounding coal and iron field is the most important in the country. There are some 20 active collieries, and the iron and steel industry of the town is very important. Modern erections are a theatre, three churches, a technical school and mining college (1891, under parish school board), and municipal buildings (at a cost of £40,000). There are two public parks, one opened in 1887. Population (1881), 24,812; (1891), 30,034; (1901), 36,981. The parish of Old Monkland contains ten villages in addition to Coatbridge.

**Coatesville,** a borough of Chester county, Pennsylvania, U.S.A., on Brandywine Creek, 40 miles west of Philadelphia. It contains rolling-mills and boiler-works. Population (1890), 3680; (1900), 5721.

**Coban,** a city of Guatemala, Central America, has greatly increased in prosperity, owing partly to the fertility of the district, but chiefly to the amazing industry of the Quecchi Indians, who are its main inhabitants. The chief trade is in coffee and Peruvian bark. An exceptionally large number of foreigners, especially Germans, have settled in the city, but it consists mainly of native cottages embosomed in gardens of flowering shrubs. It is divided into eleven "barrios" or wards, each named after a particular saint. In the plaza is the great church, with the *convento*. The population is about 18,000.

**Cobar,** a town in New South Wales, Australia, 459 miles west of Sydney, in the county of Robinson, with a terminal station on the railway line from Nyngan. Large quantities of copper ore are raised in the district, and gold-bearing reefs have been discovered and worked successfully of late years. The Great Cobar copper mine is the most important in the state. Population (1881), 1859; (1901), about 5500.

**Cobet, Carel Gabriel** (1813–1889), one of the most famous classical scholars of the 19th century, was born at Paris on 28th November 1813, of a Dutch father and French mother. It has often been said that the twofold origin is apparent in his work, which shows traces of Gallic brilliancy along with Dutch erudition. Cobet was educated in Holland at the Hague Gymnasium, where he was fortunate enough to have as his master a man of remarkable teaching power and genuine love of learning, Kappeyne van de Capello. In 1832 Cobet entered the University of Leyden, and devoted himself exclusively to classical scholarship. In 1836 he won a gold medal for an essay entitled "Prosopographia Xenophontea," a brilliant characterization of all the persons introduced into the "Memorabilia," "Symposium," and "Œconomicus" of Xenophon. In 1840 he published and defended a thesis entitled *Observationes criticæ in Platonis comici reliquias*, which first revealed his remarkable critical faculty. The university now conferred on him an honorary degree, since he had declined to follow the course that led to the ordinary one, and recommended him to the Government for a travelling pension, to enable him to study manuscripts in foreign libraries. The ostensible purpose of his journey was to collate the texts of Simplicius, but the Aristotelian commentator seems to have engaged but little of Cobet's time, and he never even published an edition of Simplicius. Instead, he contrived to make a careful study of almost every Greek manuscript in the Italian libraries, and returned after five years with an intimate knowledge of the peculiarities of copyists and the history of manuscripts. In 1846 he married, and in the same year he was appointed to a professorship at Leyden. His inaugural address, *De arte interpretandi grammatices et critices fundamentis innixa*, has been called the most perfect piece of Latin prose written in the century. The rest of his life was passed uneventfully at Leyden in study and work. In 1856 he became joint editor of *Mnemosyne*, a philological review, which he soon raised to a leading position among classical journals. In it appeared from time to time critical notes and suggested emendations from Cobet's pen, dealing with a great variety of Greek authors. These were afterwards collected in book form under the titles *Novæ Lectiones*, *Variæ Lectiones*, and *Miscellanea Critica*. In 1875 he took a prominent part at the Leyden Tercentenary, and impressed all hearers by his wonderful facility in Latin improvisation. In 1884, when his health was failing, he retired as emeritus professor. He died on 26th October 1889. Cobet's special weapon as a critic was his consummate knowledge of palæography, but he was no less distinguished for his rare acumen and the extensive command of classical literature with which he illustrated and defended his criticisms. He has been sometimes blamed for rashness in attempting to emend difficult passages, and for neglecting the comments of other scholars. He had little sympathy for the German school of criticism, and maintained that the best combination for a scholar was English good sense with French taste. He always expressed his obligation to the English, saying that his masters were three Richards—Bentley, Porson, and Dawes. (A. Z.)

**Coblenz,** or Coblentz, a town of Prussia, capital of the Rhine province, on the left bank of the Rhine, 57 miles south-south-east from Cologne by rail, headquarters of the Eighth German Army Corps. About a mile above the town the river is crossed by an iron bridge of double span (completed in 1879), carrying the Berlin-Metz Railway.

In 1890 the demolition of the landward defences was begun, and since then a great alteration has taken place on that side of the town. In 1897 a magnificent monument by Bruno Schmitz and Hundrieser to the Emperor William I. was erected at the point where the Moselle meets the Rhine. Coblenz also boasts of a museum (1891) of antiquities; monuments to General von Goeben (died here in 1880), the physiologist Johannes Müller (born here in 1801), the poet Max von Schenkendorf (died here in 1817), and the Empress Augusta (1896), who loved to reside at Coblenz; a new Roman Catholic church, St Joseph's (1896–98); a handsome promenade by the Rhine, 1½ miles long; a theatre and a musical institute. Coblenz is a principal seat of the Rhenish and Moselle wine trade, and its manufactures include pianos, paper, cardboard, machinery, and boats and barges. It is an important transit centre for the Rhine railways and those of the Lahn and Moselle, and for the Rhine navigation. Population (1885), 31,669; (1900), 45,039.

**Cobourg,** the capital of Northumberland county, Ontario, Canada, 70 miles east of Toronto by rail, on Lake Ontario. It has a safe and commodious harbour, and has steamboat communication with St Lawrence and Lake Ontario ports. It contains car-works, carpet and woollen factories, and foundries. Population (1881), 4957; (1900), 4239.

**Coburg,** a town of Germany, capital (alternating with Gotha) of the duchy of Saxe-Coburg-Gotha, 72 miles by rail north from Nuremberg. The most notable addition to the public buildings is the Edinburgh palace (1881). The old castle of Coburg now contains a museum of art and antiquities; the town also possesses an anthropological museum. A bronze statue of Prince Albert (consort of Queen Victoria), by Theed, adorns the market-place (1865); and there is a monument of the 1870–71 war in Ernest Square. Both trade and industry are flourishing, the chief branches of the latter being brewing, manufactures of machinery, colours, and porcelain, iron-founding, and saw-milling. Population (1885), 16,210; (1895), 18,688.

**Cocanada** or **Coconada,** a town of British India, in the Godavari district of Madras, on the seacoast in the extreme north of the Godavari delta, about 315 miles north of Madras. It had in 1881 a population of 28,856, in 1891 of 40,068, and in 1901 of 47,866, showing an increase of 18 per cent. The municipal revenue in 1897–98 was Rs.2,09,460. As the administrative headquarters of the district, and the chief port on the eastern coast after Madras, Cocanada is steadily growing in importance. It is connected by navigable channels with the canal system of the Godavari delta, and by a branch line with Samalkot on the East Coast Railway. The anchorage is an open roadstead, with two lighthouses. In 1897–98 the total sea-borne trade amounted to Rs.2,07,82,027, of which just one-half was conducted with foreign countries; 25 vessels entered and cleared for foreign trade, with an aggregate burthen of 23,367 tons. The chief exports are rice, cotton, sugar, and oilseeds. Mills have been established for cleaning rice. It contains a college, a high school with 408 pupils, a literary association, and five printing-presses.

**Cochabamba,** a department of Bolivia, bounded on the N. by that of La Paz, on the E. by Santa Cruz, on the S. by Chuquisaca and Potosi, and by Oruro and La Paz on the W., has an area of 21,420 square miles. In 1893 the population numbered 360,220, and was estimated in 1898 at 375,800. The capital, Cochabamba, has 40,000 inhabitants. The department is divided into nine provinces. It had in 1878, 120 schools, attended by 8337 pupils.

**Cochin,** a feudatory state of Southern India, in political subordination to Madras, with an area of 1362 square miles. The population in 1891 was 722,906, being 531 persons per square mile; in 1901 the population was 815,218, showing an increase of 13 per cent. More than one-fifth are Christians, mostly Syrians and Roman Catholics. The revenue is estimated at Rs.20,00,000, subject to a tribute of Rs.2,00,000. During recent years a balance has been accumulated of Rs.44,00,000, most of which is invested in securities of the Indian Government. The principal products are rice, coconuts, timber, cardamoms, pepper, and a little coffee. Salt is manufactured along the coast. The capital is Ernakolam, but the raja resides at Tripunthora. Apart from the British town of Cochin, the principal seaport is Malipuram. The chief means of communication is by boat along the backwaters; but a metre gauge line is being constructed at the cost of the state across the hills, from Ernakolam to Shoranur on the Madras Railway. The length will be 65 miles, and the estimated cost is £337,000. In 1897–98 the total number of schools was 1020, attended by 30,550 pupils.

The town of Cochin is comprised within the British district of Malabar. Its population in 1891 was 16,147; the municipal income in 1897–98 was Rs.21,530. Considerable sea-borne trade is still carried on. In 1897–98 the number of vessels that entered and cleared for foreign trade was 58, with an aggregate burthen of 99,775 tons. A lighthouse stands on the ruins of the old fort. The chief exports are coconut products, for the preparation of which there are factories. There are a missionary high school, three printing-presses, and a library

**Cochin-China.**—This term formerly included the whole Annamese Empire—Tongking, Annam, and Lower Cochin-China, but it now comprises only the French colony of Lower Cochin-China; this consists of the six southern provinces of the Annamese Empire which were taken possession of by France after a war with the Emperor Tu Duc. It lies between 8° and 11° 30′ N. lat. and 104° 25′ 55″ and 107° 29′ 55″ E. long., and is bounded on the N. by Annam and Cambodia, on the W. by Cambodia, on the E. by the China Sea, and on the S. and W. by the Gulf of Siam. It embraces almost the whole of the Mekong delta, which is intermingled with the mouths of the Saigon river and of the two rivers Vaico, and consists mainly of a vast plain, almost entirely flooded. In the east, however, lies a mountain group of moderate altitude (extending from Cape St Jacques to the frontier of Annam), from which descend the rivers Donnai and Saigon. This region is inhabited by the Mois. The Mekong enters the sea by numerous mouths, which shift position under the varying effects of flood currents. Canals from Chaudoc to Hatien (Cancao) and from Long-Xuyen to Rash-Gia unite it with the Gulf of Siam. Several canals connect the Saigon river with the eastern arm of the Mekong. The ports of Saigon and Mytho are accessible to the largest vessels, and are connected by a railway. The roadsteads of Rash-Gia, Camao, and Hatien can accommodate only vessels of low tonnage. The climate, which is hot and damp, is divided into two very regular seasons by the north-east and south-west monsoons, the former prevailing from October 15th to April 15th, the latter from April 15th to October 15th. The temperature varies from 60°·8 to 86° F. during the former, to 82°·4 to 95° F., or even higher, during the latter. Rains and tornadoes occur daily from

May to July, and from the middle of August to the end of September.

The area of Cochin-China is returned at 23,160 square miles, and in 1899 the inhabitants numbered 2,323,499, of whom 4451 were Europeans, 1601 being officials, and 1023 the members of their families. The Annamese number 2,054,831; the Cambodians, 182,659; the Mois, 6374; the Chams, 2656; the Chinese, 65,801; the Malays, 4130. The remainder consists of Tagals, Indians, Japanese, &c. Saigon, which in 1882 numbered only 13,000 inhabitants, has now a population of 44,764, and is the capital not only of Cochin-China, but also of French Indo-China. In 1899 there were in the colony 232 schools, with 115 European and 1183 native teachers, and 28,000 pupils. The Roman Catholic population numbered 73,234; and the Buddhists, 1,688,270. Cochin-China was autonomous until 1887, when it was divided into six provinces under the authority of a governor, assisted by a Colonial Council. The prosperity of the colony grew rapidly, and when Tongking and Annam were conquered, Cochin-China contributed 5,000,000 piastres to the Tongking budget. This contribution fell in 1892 to 4,000,000

SKETCH MAP OF COCHIN-CHINA.

piastres, and on the unification of Indo-China it ceased, Cochin-China furnishing, as do the other countries, its share to the general budget. The local budget for 1900 was estimated at 4,439,500 piastres for revenue and expenditure; for 1901 it was estimated at 4,204,244 piastres, revenue and expenditure. According to official accounts, the actual receipts to August 31, 1899, amounted to 4,253,192 piastres. The local government is now administered by a lieutenant-governor, who has a seat on the Superior Council of Indo-China, and is assisted by a Colonial Council composed of fifteen members, of whom eight are Europeans and seven Asiatics. Four of the European members are elected by universal suffrage, two are delegated by the Chamber of Commerce, and two by the Privy Council, which assists the governor-general. Cochin-China is divided into six provinces, Saigon, Mytho, Vinh-Long, Bassac, Saigon, and Cholon; and twenty districts, each having at its head an administrator of native affairs, who presides over all civil service not undertaken by the general government. The self-administering municipalities of Saigon and Cholon districts used to be, but by a recent decision these *arrondissements* were made provinces, to secure uniformity of nomenclature of administrative areas. Cochin-China is represented in the French Chamber by a deputy. Asiatic foreigners are subjected to a *déclaration de séjour*, and also pay a capitation fee. Besides French troops maintained by France, there are 2405 native soldiers maintained by the budget of Indo-China.

*Commerce.*—About one-sixth of the total area is cultivated, the chief crop being rice. The imports of merchandise in 1898 amounted to 54,964,222 francs; the exports to 108,010,322 francs. The chief exports in 1898 were rice, 772,789 tons (of which 296,845 tons were cargo rice, and 286,841 tons white rice), of a total value, according to the customs returns, of £3,557,525; fish, value £233,440; cotton, £64,928; silk, £77,225; hides, isinglass, pepper, cardamom. Coffee culture is increasing, the number of coffee plants in 1899 being 429,228, mostly belonging to Europeans. Cochin-China and Cambodia now forms a single customs district, and the commercial statistics for both are included under one head. The total trade for 1889 amounted to 177,238,958 francs, of which 66,234,008 francs represented imports and 111,004,950 francs exports. At Saigon, in 1899, 669 vessels of 811,157 tons entered; of these, 234 of 333,714 tons were French, and 435 of 477,443 tons foreign. There are 51 miles of railway, Saigon to Mytho, and 2676 miles of telegraph line, and 85 telegraph offices. There are 79 post offices. The construction of 850 miles of new railway is proposed.

See also Indo-China. (J. M. A. de L.)

**Cock, Edward** (1805–1892), British surgeon, was born in 1805. He was a nephew of Sir Astley Cooper, and through him became at an early age a member of the staff of the Borough Hospital in London, where he worked in the dissecting room for thirteen years. Afterwards he became in 1838 assistant surgeon at Guy's, where from 1849 to 1871 he was surgeon, and from 1871 to 1892 consulting surgeon. He rose to be president of the College of Surgeons in 1869. He was an excellent anatomist, a bold operator, and a clear and incisive writer, and though in lecturing he was afflicted with a stutter, he frequently utilized it with humorous effect and emphasis. From 1843 to 1849 he was editor of *Guy's Hospital Reports*, which contain many of his papers, particularly on stricture of the urethra, puncture of the bladder, injuries to the head, and hernia. He was the first English surgeon to perform pharyngotomy with success, and also one of the first to succeed in trephining for middle meningeal hæmorrhage; but the operation by which his name is known is that of opening the urethra through the perinæum (see *Guy's Hospital Reports*, 1866). He died at Kingston in 1892.

**Cockburn, Sir Alexander James Edmund,** Bart. (1802–1880), Lord Chief Justice of England, was born on 24th December 1802, and came of ancient Scottish stock. An ancestor, Alexander de Cockburn (descended from Petrus de Cockburn of Berwickshire, A.D. 1214), was granted in 1358 the barony of Carriden, county Linlithgow, and was appointed with his heirs for ever Ostiarius Parliamenti (usher of the White Rod) by King David II. A subsequent ancestor, Sir William Cockburn, who was created a baronet of Nova Scotia in 1627, had some difficulty in asserting his right to this office, but ultimately succeeded, and afterwards alienated a moiety of it, becoming a joint usher with Colonel Cunningham. His son, Archibald, however, in 1674, bought back the half-right so disposed of, and obtained a fresh grant. The fifth baronet fell at Fontenoy in 1745, and his cousin, James Cockburn, at one time M.P. for Peebles, succeeded him as sixth

baronet. This gentleman, who in 1757 sold Langton, which had been the seat of the family since the fourteenth century, had a large family. His three elder sons held the title in succession, while the future Lord Chief Justice of England was the only son of the fourth son, Alexander, and eventually in 1858 followed his uncle, Sir William Cockburn, dean of York, as tenth baronet. Mr Alexander Cockburn, the father of Sir Alexander, was British Envoy Extraordinary and Minister Plenipotentiary to the State of Columbia, and married Yolande, daughter of the Vicomte de Vignier. Young Alexander was at one time intended for the diplomatic service, and frequently during the legal career which he ultimately adopted he was able to make considerable use of the knowledge of foreign languages, especially French, with which birth and early education had equipped him. He went eventually to Trinity Hall, Cambridge, where he did well, winning prizes for Latin and English composition, and appearing second in the first class of the law-tripos in 1825, although he does not seem to have proceeded to his degree until 1829. He was elected a fellow, and afterwards an honorary fellow of his college, and having entered at the Middle Temple in 1825, was called to the Bar in 1829; but though he had shown himself a young man of considerable gifts, he had not exhibited promise of the industry and energy which, in spite of a pleasure-loving temperament, ultimately won for him success. He joined the Western Circuit, and for some time such practice as he was able to obtain lay at the Devon Sessions, Quarter Sessions at that time affording an opening and a school of advocacy to young counsel not to be found anywhere fifty years later. In London he had so little to do that only the persuasion of friends induced him to keep his London Chambers open. Three years after his call to the Bar, however, the Reform Bill was passed, and the petitions which followed the ensuing general election gave rise to a large number of new questions for the decision of Election Committees, and afforded an opening of which he promptly availed himself. The decisions of the Committees had not been reported since 1821, and with Mr Rowe, another member of the Western Circuit, Cockburn undertook a new series of Reports. They only published one volume, but the work was well done, and in 1833 Cockburn had his first parliamentary brief on behalf of Mr Henry Lytton Bulwer, and Mr Ellice, Secretary to the Treasury, the sitting members for Coventry. In 1834 Cockburn was well enough thought of to be made a member of the Commission to inquire into the state of the corporations of England and Wales. Other parliamentary work followed; but he had ambition to be more than a parliamentary counsel, and he attended diligently on his Circuit, besides appearing before Committees. In 1841 he was in a position to take silk; and in that year a charge of simony, brought against his uncle, the dean of York, enabled him to appear conspicuously in a case which attracted considerable public attention, the proceedings taking the form of a motion for prohibition duly obtained against the Ecclesiastical Court, which had deprived Dr Cockburn of his office. Not long after this, Sir Robert Peel's secretary, Mr Drummond, was shot by the crazy Scotchman, M'Naughten, and Cockburn, briefed on behalf of the assassin, not only made a very brilliant speech, which established the defence of insanity, but also secured the full publicity of a long report in the *Morning Chronicle* of the 6th of March 1843. Another well-known trial in which he appeared a year later was that of Wood *v.* Peel (*Times*, 2nd and 3rd July 1844), the issue being in form to determine the winner of a bet (the Gaming Act was passed in the following year) as to the age of the Derby winner Running Rein — in substance to determine, if possible, the vexed question whether Running Rein was a four-year-old or a three-year-old when he was racing as the latter. Running Rein could not be produced by Mr Wood, and Baron Alderson took a strong view of this circumstance, so that Cockburn found himself on the losing side, while his strenuous advocacy of his client's cause had led him into making, in his opening speech, strictures on Lord George Bentinck's conduct in the case which had better have been reserved to a later stage. He was, however, a hard fighter, but not an unfair one,—a little irritable at times, but on the whole a courteous gentleman, and his practice went on increasing. In 1847 he decided to stand for Parliament, and was elected without a contest at Southampton, standing as a Liberal and a reformer. During his first year or two in Parliament he showed himself to be a useful speaker on topics of legal reform, and gained the respect of his fellow members; and in 1850 he had a chance, of which he availed himself to the utmost. The "Pacifico" dispute with Greece related, it will be remembered, to the treatment of a M. Pacifico, and other persons said to be British subjects, by a Greek mob, and to the forcible methods of Lord Palmerston in causing a British fleet to blockade the Piræus in order to enforce attention to his demands for compensation. The Government was defeated in the House of Lords on this question, and in the House of Commons had a hard fight to carry the vote of confidence proposed by Mr Roebuck, member for Sheffield. A lawyer was wanted to bring out the legal position of the Government. Mr Crowder, afterwards a judge, was not equal to the task; but on the third night of the debate Cockburn moved the adjournment of the House after Mr Gladstone had spoken, and on the following night made a speech, of which Lord Palmerston wrote to Lord Normanby:—"As to Cockburn's, I do not know that I ever in the course of my life heard a better speech from anybody, without any exception." Cockburn made another excellent speech very soon after this on the question of the treatment by Austria of the Magyar rebels; and when, less than a month later, Sir John Jervis retired, and Sir John Romilly was promoted to be Attorney-General, he became Solicitor-General and was knighted. He succeeded to the Attorney-Generalship in 1851, on the appointment of Romilly as Master of the Rolls.

In February 1852 the Ministry resigned, and Cockburn vacated his post. During the short administration of Lord Derby which followed, Thesiger was Attorney-General, and Cockburn was engaged against him in the case of R. *v.* Newman, on the prosecution of Achilli. This was the trial of a criminal information for libel filed against John Henry Newman, who had denounced a scandalous and profligate friar named Achilli, then lecturing on Roman Catholicism in England. Newman pleaded justification; but the jury who heard the case in the Queen's Bench, with Lord Campbell presiding, found that the justification was not proved except in one particular: a verdict which, together with the methods of the judge and the conduct of the audience, attracted considerable comment. The verdict was set aside, and a new trial ordered, but none ever took place. In December 1852, under Lord Aberdeen's Ministry, Cockburn became again Attorney-General, with Bethell as Solicitor-General, and so remained until 1856, taking part in many celebrated trials, such as the Hopwood Will Case in 1855, and the Swynfen Will Case, but notably leading for the Crown in the trial of William Palmer of Rugeley in Staffordshire,—an ex-medical man who had taken to the turf, and who had poisoned a friend of similar pursuits named Cook with strychnine, in order to obtain money from his estate by forgery and

otherwise. Sir Alexander Cockburn made an exhaustive study of the medical aspects of the case, and the prisoner's comment when convicted after a twelve days' trial was, alluding to the Attorney-General's advocacy, "It was the riding that did it." In 1854 Cockburn was made recorder of Bristol. In 1856 Sir John Jervis died, and Cockburn became Chief Justice of the Common Pleas. In 1859 Lord Campbell became Chancellor, and Cockburn became Chief Justice of the Queen's Bench, continuing as a judge for twenty-four years, and dying in harness. On Friday, the 19th of November 1880, he tried causes with special juries at Westminster; on Saturday, the 20th, he presided over a Court for the consideration of Crown Cases Reserved; he walked home, and on that night he died of *angina pectoris* at his house in Hertford Street. It is characteristic of the man that when he learnt that he was dying, his comment to his doctor was, "Well, I have had a good time."

Sir Alexander Cockburn earned and deserved a high reputation as a judge. He was a man of brilliant cleverness and rapid intuition, rather than of profound and laboriously cultivated intellect. He had been a great advocate at the Bar, with a great charm of voice and manner, as well as a fluent and persuasive tongue, rather than a learned lawyer, but he was considered to be a good lawyer before he died, some assigning his unquestioned improvement in this respect to his frequent association on the bench with Blackburn. He had notoriously little sympathy with the Judicature Acts. Many were of opinion that he was inclined to take an advocate's view of the cases before him, making up his mind as to their merits prematurely and, in consequence, wrongly, as well as giving undue prominence to the views which he so formed; but he was beyond doubt always in intention, and generally in fact, scrupulously fair. Lord Russell of Killowen, L.C.J., writing of his immediate predecessor Lord Coleridge in 1894, gave his opinion that the beauty of Lord Coleridge's voice was unsurpassed in his experience, except perhaps by Sir Alexander Cockburn, Mr Gladstone, Sir Robert Peel, and Father Burke of the Dominican Order. Coleridge, he further says, "could not have made the great Don Pacifico speech of Sir Alexander Cockburn; but then, who could?" Commenting on the case of Saurin *v.* Starr (Feb. 1869), in which Coleridge led for the plaintiff, Lord Russell also wrote: "Sir Alexander Cockburn tried the case, and it afforded a strong illustration of a peculiarity in that remarkable man which those who practised before him will recognize. He began by being breast-high for the plaintiff, and so continued during the earlier stages of the trial; but as the trial progressed, and especially after Mr Mellish's opening speech, he speedily turned round, and did all he could to secure a verdict for the defendants. But it was too late. The case was of a kind, not unnaturally, to excite prejudice against them, and the minds of the jury could not be turned back from the direction which the earlier action of the Chief Justice had given them." This criticism is interesting as coming from so great an advocate and so masterful a Lord Chief Justice, himself by no means given to concealing his prejudices. It will further be remembered, however, that in this case Lord Russell, then Mr Charles Russell, was counsel on the losing side, that the case involved charges against a Roman Catholic religious establishment, and that he was himself a staunch Roman Catholic. Mr Justin M'Carthy calls Cockburn "one of the few great advocates who ever made a political figure in the House of Commons." Disraeli, in a characteristic speech, once said of him in the House: "He is a man of transcendent abilities; . . . he sustained the reputation which he had attained here and in the Courts of his country with learning and majesty . . . He has shown himself a jurist and a publicist of the highest character" (*Times*, 24th April 1875). This was on the occasion of an attack upon him by Dr Kenealy, M.P., the Tichborne claimant's counsel in the trial at Bar which consigned the claimant to penal servitude for perjury. Sir Alexander Cockburn, with Mr Justice Mellor and Mr Justice Lush, had tried him, the case lasting one hundred and eighty-eight days, of which the Lord Chief Justice's summing up occupied eighteen. It is not necessary to enumerate the many *causes célèbres* at which Sir Alexander Cockburn presided as a judge. It was thought that he went out of his way to arrange that they should come before him, and his successor, Lord Coleridge, writing in 1881 to Lord Bramwell, to make the offer that he should try the murderer Lefroy as a last judicial act before retiring, added, "Poor dear Cockburn would hardly have given you such a chance." Be this as it may, Cockburn tried all cases which came before him, whether great or small, with the same thoroughness and with great courtesy and dignity, so that no counsel or suitor could complain that he had not been fully heard in a matter in which the issues were seemingly trivial; while he certainly gave great attention to the elaboration of his judgments and charges to juries.

The greatest public occasion on which Sir Alexander Cockburn acted, outside his usual judicial functions, was that of the *Alabama* Arbitration, held at Geneva in 1872, in which he represented the British Government, and dissented from the view taken by the majority of the arbitrators, without being able to convince them. He prepared, with Mr C. F. Adams, the representative of the United States, the English translation of the award of the arbitrators, and published his reasons for dissenting in a vigorously worded document which did not meet with universal commendation. He admitted in substance the liability of England for the acts of the *Alabama*, but not on the grounds on which the decision of the majority was based, and he held England not to be liable in respect of the *Florida* and the *Shenandoah*. His opposition to the appointment of Sir Robert Collier to the Judicial Committee of the Privy Council had, shortly before the arbitration, so embroiled him with the Government that, stung by a speech of the duke of Argyll, he had threatened to resign his position as arbitrator. His views on the Collier controversy were chiefly expressed in letters to Lord Westbury; he was at all times fond of controversy and controversial writing.

In personal appearance Sir Alexander Cockburn was of small stature, but his dignity of deportment caused this to be forgotten. His courtesy and polish of manner have been referred to. In private life he was fond of sport, and he was engaged in writing a series of articles on the "History of the Chase in the Nineteenth Century" at the time of his death. He took his relaxation during his last years in his yacht the *Zouave*, and he was also fond of music. He was fond, too, of society; and in the interesting debate on the Tichborne trial, to which reference has been made, some aid was lent to Kenealy's attack by a jocular, but somewhat imprudent, remark of Cockburn's to a lady at a dinner-party, which she was foolish enough to repeat. He was also throughout his life addicted to frivolities not altogether consistent with advancement in a learned profession, or with the positions of dignity which he successively occupied. Shooting once at Hinton with Lord Westbury, when a high rocketing pheasant was nearly dropped on his head by another gun, Sir Alexander Cockburn, who had not seen the bird, called out, "Fire high, fire high." Whereupon Lord Westbury said, "Don't be alarmed, Chief Justice: you are quite safe. You are not as near heaven as that bird was when it was shot, and I am sadly afraid, after those stories of yours at luncheon, that you never will be." At the same time he showed no lack of dignity in his public capacity. He had a high sense of what was due to, and expected from, his profession; and his utterance upon the limitations of advocacy, in his speech at the banquet given in the Middle Temple Hall to Mons. Berryer, the celebrated French advocate, may be called the classical authority on the subject. Lord Brougham, replying for the guests other than Berryer, had spoken of "the first great duty of an advocate to reckon everything subordinate to the interests of his client." The Lord Chief Justice, replying to the toast of "the Judges of England," dissented from this sweeping statement, saying, amid loud cheers from a distinguished assembly of lawyers, "The arms which an advocate wields he ought to use as a warrior, not as an assassin. He ought to uphold the interests of his clients *per fas*, not *per nefas*. He ought to know how to reconcile the interests of his clients with the eternal interests of truth and justice" (*Times*, 9th Nov. 1864). Sir Alexander Cockburn was never married, and the baronetcy became extinct at his death.

(E. A. AR.)

**Cockermouth,** a market-town in the Cockermouth parliamentary division (since 1885) of Cumberland, England, on the Derwent, 27 miles south-west of Carlisle by rail. A statue was erected in 1875 to the sixth earl of Mayo, who represented the borough in parliament and was subsequently viceroy of India. Ironworks, tanneries, and confectionery works have been established. Area of township (an urban district), 2425 acres. Population (1881), 5353; (1901), 5355.

**Cocos Islands.** See KEELING ISLANDS.

**Codex Bezæ.**—The MS. which is known by the name of Codex Bezæ, after the great Reformer, and which is marked amongst the MSS. of the New Testament by the sign D (or rather by the two signs D, d, according as its Greek or Latin side is under discussion), is a bilingual [Græco-Latin] codex, containing, with some lacunæ, the text of the Four Gospels and the Acts, in an uncial hand which is commonly ascribed to the sixth century. From the fact that a fragment of the 3rd Epistle of John precedes the Acts, it has been inferred that it at one time contained the Catholic Epistles, though not in the common order, and from a study of the ancient numbering of the quires, it appears that the missing matter was not confined to the Catholic Epistles, and that some other book was also included, but no satisfactory conjecture has yet been made as to the character of the missing portion. The order of the Gospels is that which was once common in the West, in which the Apostolic Evangelists come first, namely, Mt, Joh, Lu, Mc, the whole book being denoted by

Mt + Joh + Lu + Mc + X + Cath + Acts,

where X stands for the unknown missing matter, and *Cath* for the portions of the Catholic Epistles which it once contained (the three epistles of John, at the least).

The MS. was presented by Beza to the University of Cambridge, in whose public library it has since been preserved, in the year 1582. If Beza's own account can be trusted, it was brought to him from the monastery of St Irenæus at Lyons, where it had been lying mutilated and covered with dust, the time of its discovery being the sack of Lyons in 1562. Some superficial grounds for doubting the exactness of this statement are found in the facts (1) that Beza in his latest Greek Testament (1598) calls it Claromontanus, and not Lugdunensis (a term he never seems to apply, using instead the colourless *vetustissimus*); (2) that it was in Italy shortly before 1550, for this is undoubtedly the MS. marked β′ from which readings are given on the margin of Robert Stephen's edition of the N.T. in that year, and which is expressly stated by him to have been collated by "our friends in Italy." But these statements can be reconciled by adding the further evidence of Marianus Victorius as to the production at the Council of Trent (in 1546?) of an ancient Greek MS. confirming the Latin reading of John 21²². This MS. was produced by William à Prato, bishop of Clermont in the Auvergne, and the neighbourhood of Clermont Ferrand to Lyons may be thought sufficient to explain at once the presence of the book in Italy and the fluctuation as to its title in the last Bezan N.T. It should be remarked, however, that there has recently been a recrudescence of suspicions as to the accuracy of Beza's statements concerning the Codex, and that some modern scholars, becoming sceptical as to its connexion with Lyons at all, are looking for a home for the Codex in Italy, previous to its passing into Beza's hands.

Whatever may be the outcome of this demand for re-examination of the Bezan statements, it should be noted that Beza had not the slightest suspicion that his beloved *vetustissimus* was the same as the β′ of Stephen; for he quotes them as if they were two separate authorities, even in places where the Bezan Codex is most singular. Perhaps we must not be too severe on him in this, for the very same doubling of the authorities is found in Bianchini, *Ev. Quadruplex*, p. 483 ("Lucæ, c. 6, v. 4, extat hic et in Steph. β′ insignis pericope de homine operante die sabbati"), where the reading discussed is the most conspicuous singularity in the whole MS., the passage at which the MS. usually stands open in the University Library at Cambridge. If Bianchini fell into the same trap, we must not judge Beza too hardly. In any case he cannot have known that his MS. had been collated for Robert Stephen in Italy. One would like to know something more about this collation. Who were the friends that collated? The term seems too vague for his son Henry, who probably was in Italy just at the right time for making the collation. Was there another hand? Perhaps that of Vatablus? And was the collating done at Trent? On these points some further information may be accessible. Meanwhile we adhere provisionally, but with some hesitation, to the belief that it is a Lyons MS.

We have already alluded, in passing, to two singular readings of the MS. in which it appears to be unique, namely, the reading in Joh 21²², εαν αυτον θελω μενειν ουτως εως ερχομαι ("if I wish him to remain thus until I come"), and the unique interpolation in Lu 6⁴ (τη αυτη ημερα θεασαμενος τινα εργαζομενον τω σαββατω ειπεν αυτω, ανθρωπε, ει μεν οιδας τι ποιεις, μακαριος ει· ει δε μη οιδας, επικαταρατος και παραβατης ει του νομου = "on the same day having observed one working on the Sabbath he said to him, Man, if thou knowest what thou dost, blessed art thou; but if thou knowest not, thou art accursed and a transgressor of the law"). These singular readings and interpolations are characteristic of the Codex Bezæ, and apparently Beza himself, though he quotes many of the most surprising readings, felt some alarm at them, for he explained to the University of Cambridge that the MS. ought not to be published, for fear of giving offence (*asservandum potius quam publicandum*). At the same time he was alive to its critical value, and appears to have recognized its relation to the old Latin and Syriac texts of the New Testament.

The MS. was not long in the possession of the university before its text was transcribed, more or less completely. It was transcribed in 1583 for Archbishop Whitgift, and partly collated by Patrick Young. Archbishop Usher collated it for Walton's Polyglot (1657), and Wetstein studied it closely in 1716. In 1732 it was collated by John Dickinson, with a view to remedy the errors in the critical apparatus of Mill. However imperfect these and other collations may be, they have an occasional scientific value at the present day in cases where the MS. has become illegible or damaged, *e.g.*, Ac 21¹⁶, where Whitgift's transcript should be consulted, along with the other early readers and collators. Whitgift's copy is in the Trinity College Library, Dickinson's in Jesus College Library, the others are to be consulted in the several New Testaments to which they belong. In 1793 the first great attempt was made by the University of Cambridge to publish an accurate transcript of the whole text. The work was entrusted to Dr Thomas Kipling, and splendidly issued in two folio volumes. The prolegomena were poor, but the transcript was fairly accurate; the work was, however, fiercely attacked on two sides on which it was singularly vulnerable, the Latin of the preface and its logic. Thomas Edwards, of Clare Hall, produced a tract on Kipling's work, which was written in the liveliest style of 18th century polemic. The tract is, however, hardly intelligible without a knowledge of contemporary university politics into which Edwards frequently diverges, and which have little interest at the present day. A more serious defect was the use of a single fount of type, both for the text and the marginal annotations, which are centuries later than the body of the text, a fault which led Credner, and in our own time Resch, into serious errors with regard to the origin of the text. The next great step in the knowledge of the text was taken when the MS. was edited by the Rev. F. H. Scrivener, in 1864, with a very complete series of annotations and prolegomena, in which everything was done, or almost everything that an editor could do, to furnish the student with an exact representation, in ordinary type, of the contents of the MS., and to supply at the same time criteria for discriminating the various hands by which the MS. had experienced correction or annotation, and generally recording the fortunes and the history both of the MS. and the peculiar text which it transmits. Facsimiles were engraved of two corresponding pages of the Greek and Latin, and of a number of places where correcting or annotating hands had been at work; and, on the whole, a notable advance was made in the materials for the history of the Codex. In 1900 the whole MS. was photographically reproduced for the university by the hands of Dujardin of Paris, the very fragile and much worn book being thus rendered the secure possession of scholars everywhere. The use of the photolithograph may sometimes mislead the reader, in cases where the shades of colour of the inks employed are no longer discriminated, and where the extreme tenuity of the vellum has allowed both the obverse and reverse of a leaf to appear at once in the transcript.

A word should be said at this point with regard to the text and its annotators and correctors. Naturally, after Kipling and Scrivener there is not much to be added in the way of readings to the text; but it should be observed that Blass (to whom we shall presently refer) has read several places in the text where Scrivener had to resort to conjecture, *e.g.*, the reading of Scrivener in

Acts 18⁷ is μεταβας [δε απο ακυ] λα
[εισ]ηλθεν εις τον [ο]ι[κ]ον τινος,

where Blass reads

μεταβας [απο του] ακυλα in the first line,

and Harris reads

και ηλθεν εις τον [ο]ι[κ]ον τινος

in the second line.

The importance of the correction lies in the explanation

that Paul left, not Aquila, but Aquila's house; and in the restoration of a curious syntactical construction which is peculiar to Codex Bezæ. Other corrections may be made. But it is in the annotations that the student will, by the aid of the facsimile, add most to the Scrivener transcript, and where he will make many corrections both as to the matters deciphered and the dates to which the hands are assigned. Of publications which in recent times have dealt with the Codex Bezæ, and the peculiar Western text of which it is the chief representative, the following should be noted:—(1) J. Rendel Harris, *Study of Codex Bezæ* (1891), in which the problem of the Bezan text was reopened, and an attempt was made to explain the peculiarities by the hypothesis of Latin reactions upon a Greek text, accompanied in a lesser degree by some Syriac reactions, the additional matter being largely due to a glossator who was probably under the influence of the Montanist movement. (2) F. H. Chase, *Old Syriac Element in the Codex Bezæ* (1893) and *The Sylo-Latin Text of the Gospels* (1895), in which substantially the whole of the Bezan peculiarities were referred to Syriac influence, and an attempt was made to find the original home of the text in Antioch. (3) The reply by Harris in *Four Lectures on the Western Text* (1894) should be studied, both for what it contradicts and what it concedes, and especially for the proof it contains of the early diffusion of the Bezan accretions to the Acts in Mesopotamia and other parts of the East. (4) But these and other attempts to explain the genesis of the Bezan text were cast into the shade by a brilliant hypothesis of Professor Blass of Halle, who maintained that the Lucan writings (St Luke and the Acts) in which the deviation of the Codex Bezæ from canonical form is most conspicuous, were in reality extant in two separate editions produced by St Luke himself, one of which he calls Antiochian, and the other Roman, a hypothesis which Blass defends with astonishing learning and skill, and in which he enlisted, almost at once, a body of sympathizers such as Nestle, Hilgenfeld, Belser, Salmon, and others, whose writings must be referred to. Blass himself not only published the Acts in what he supposed to be the original double edition, but defended himself against all attacks with amazing vigour, so that even Harnack has hardly succeeded in demolishing his theory. Whether, however, this theory can be finally sustained is still *in lite*. What is certain is that the Western text, as represented in the Codex Bezæ and cognate authorities, is older and more widely diffused than had been generally recognized; that it was extant in Greek, Latin, and Syriac in the earliest times; and that no single series of linguistic reactions can explain it away. And whatever be the exact value of the Blass demonstrations and reconstructions, it is evident that a great increase of critical weight has accrued to the Western readings generally in consequence of them; so that, even if it be conceded, as it must be, that the Codex Bezæ is subject to all kinds of corrupting influences, such as lectionary prefaces, harmonizations, and bad transcriptions, the nucleus of the text is as old as anything which we have in evidence for the text of the New Testament. A striking instance of this may be found in a far-reaching observation of a pupil of Professor Blass, named Lippelt, who found on examining the spelling of the name Ἰωάννης in the Codex Bezæ, that the name was almost uniformly spelt with one ν in the two Lucan books, although in the rest of the Codex the conventional spelling has prevailed. This striking testimony to the fact that the Bezan Luke and Acts once circulated together in a separate volume, though they are not now side by side, may be further extended by examining the Latin version, from which it appears that the spelling with one *n* prevails in Luke, but not in Acts, the inference being that the combined Lucan volume was not translated all at once, but at two different times and by two different hands. The Bezan text, therefore, retains traces of the history and collection of the books of the N.T. and of their translation which are not to be found in any other MS., and to be faithful thus *in minimis* renders it certain that it is also trustworthy in greater matters. The ultimate discrimination of the various elements in the Bezan (Western) text has yet to be made, and the suspicion is that the problem has not yet found its Newton. (J. R. HA.)

**Cœlentera** form a Group or Grade of the Animal Kingdom, the zoological importance of which has risen considerably since the time (1887) of the publication of the original article in the *Ency. Brit.*, even though their numbers have been reduced by the elevation of the Sponges or Porifera to the rank of an independent Phylum under the title Parazoa (Sollas, 1884). For the Cœlentera thus restricted, the term Enterocœla, in contrast to Cœlomocœla (the old Cœlomata), was suggested by Lankester (1900). From the more complex colonial Protozoa the Cœlentera are readily separated by their possession of two distinct sets of cells, with diverse functions, arranged in two definite layers,—a condition found in no Protozoan. The old criterion by which they and other Metazoa were once distinguished from Protozoa, namely, the differentiation of large and small sexual cells from each other and from the remaining cells of the body, has been broken down by the discovery of numerous cases of such differentiation among Protozoa. The Cœlentera, as contrasted with other Metazoa (but not Parazoa), consist of two layers of cells only, an outer layer or ectoderm, an inner layer or endoderm. They have hence been described as Diploblastica. In the remaining Metazoa certain cells are budded off at an early stage of development from one or both of the two original layers, to form later a third layer, the mesoderm, which lies between the ectoderm and endoderm; such forms have therefore received the name Triploblastica. At the same time it is necessary to observe that it is by no means certain that the mesoderm found in various groups of Metazoa is a similar or homologous formation in all cases. A second essential difference between Cœlentera and other Metazoa (except Parazoa) is that in the former all spaces in the interior of the body are referable to a single cavity of endodermal origin, the "gastro-vascular cavity," often termed the cœlenteron: the spaces are always originally continuous with one another, and are in almost every case permanently so. This single cavity and its lining serve apparently for all those functions (digestion, excretion, circulation, and often reproduction) which in more complex organisms are distributed among various cavities of independent and often very diverse origin.

In the Cœlentera the ectoderm and endoderm are set apart from one another at a very early period in the life-history; generally either by delamination or invagination, processes described in the article EMBRYOLOGY. Between these two cell-layers a mesoglœa (Bourne, 1887) is always intercalated as a secretion by one or both of them; this is a gelatinoid, primitively structureless lamella, which in the first instance serves merely as a basal support for the cells. In many cases, as, for example, in the Medusæ or jelly-fish, the mesoglœa may be so thick as to constitute the chief part of the body in bulk and weight. The ectoderm rarely consists of more than one layer of cells: these are divisible by structure and function into nervous, muscular, and secretory cells, supported by interstitial cells. The endoderm is generally also an epithelium one cell in thickness, the cells being digestive, secretory, and sometimes muscular. Reproductive sexual cells may be found in either of these two layers, according to the class and

sub-class in question. The mesoglœa is in itself an inert non-cellular secretion, but the immigration of muscular and other cells into its substance, both from ectoderm and endoderm, gives it in many cases a strong resemblance to the mesoderm of Triploblastica,—a resemblance which, while probably superficial, may yet serve to indicate the path of evolution of the mesoderm.

The Cœlentera may thus be briefly defined as Metazoa which exhibit two embryonic cell-layers only,—the ectoderm and endoderm,—their body-cavities being referable to a single cavity or cœlenteron in the endoderm. Their position in the Animal Kingdom and their main subdivisions may be expressed in the following table :—

I. PROTOZOA.
II. PARAZOA.
III. METAZOA.

Cœlentera = Diploblastica. | Triploblastica (including Cœlomata).

Hydromedusæ. | Scyphozoa. | Ctenophora.

Scyphomedusæ. | Anthozoa.

On a comparison of these subdivisions with those adopted by Professor Lankester in the article Hydrozoa (*Ency. Brit.* vol. xii.), it will be noticed that the Scyphomedusæ then included with the Hydromedusæ as Hydrozoa are here placed nearer to the Anthozoa than to their old pendants. The reasons for this may be stated briefly.

The HYDROMEDUSÆ are distinguished from the Scyphozoa chiefly by negative characters; they have no stomodæum, that is, no ingrowth of ectoderm at the mouth to form an œsophagus; they have no mesenteries (radiating partitions) which incompletely subdivide the cœlenteron; and they have no concentration of digestive cells into special organs. Their ectodermal muscles are mainly longitudinal, their endodermal muscles are circularly arranged on the body-wall. Their sexual cells are (probably in all cases) produced from the ectoderm, and lie in those radii which are first accentuated in development. They typically present two structural forms, the non-sexual hydroid, and the sexual medusoid; in such a case there is an alternation of generations (metagensis), the hydroid giving rise to the medusoid by a sexual gemmation, the medusoid bearing sexual cells which develop into a hydroid. In some other cases medusoid develops directly from medusoid (hypogenesis), whether by sexual cells or by gemmation. The medusoids have a muscular velum of ectoderm and mesogloea only.

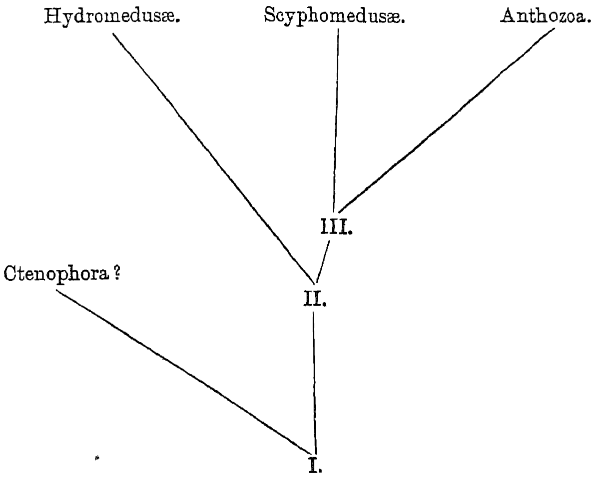
The SCYPHOZOA have the following features in common:—They typically exhibit an ectodermal stomodæum; partitions or mesenteries project into their cœlenteron from the body-wall, and on these are generally concentrated digestive cells (to form mesenterial filaments, phaceuæ, etc.); the external musculature of the body-wall is circular (except in *Cerianthus*); the internal, longitudinal; and the sexual cells probably always arise in the endoderm.

The SCYPHOMEDUSÆ, like the Hydromedusæ, typically present a metagenesis, the non-sexual scyphistomoid (corresponding to the hydroid) alternating with the sexual medusoid. In other cases the medusoid is hypogenetic, medusoid producing medusoid. The sexual cells of the medusoid lie in the endoderm on interradii, that is, on the second set of radii accentuated in the course of development. The medusoids have no true velum; in some cases a structure more or less resembling this organ, termed a velarium, is present, permeated by endodermal canals.

The ANTHOZOA differ from the Scyphomedusæ in having no medusoid form; they all more or less resemble a sea-anemone, and may be termed actinioid. They are (with rare exceptions, probably secondarily acquired) hypogenetic, the offspring resembling the parent, and both being sexual. The sexual cells are borne on the mesenteries in positions irrespective of obvious developmental radii.

The CTENOPHORA are so aberrant in structure that it has been proposed to separate them from the Cœlentera altogether: they are, however, theoretically deducible from an ancestor common to other Cœlentera, but their extreme specialization precludes the idea of any close relationship with the rest (see CTENOPHORA).

As regards the other three groups, however, it is easy to conceive of them as derived from an ancestor, represented to-day to some extent by the planula-larva (*Ency. Brit.*, HYDROZOA, vol. xii. p. 548), which was Cœlenterate in so far as it was composed of an ectoderm and endoderm, and had an internal digestive cavity (I. of the table).



At the point of divergence between Scyphozoa and Hydromedusæ (II. of the table of hypothetical descent), we may conceive of its descendant as tentaculate, capable of either floating (swimming) or fixation at will like Lucernaria to-day; and exhibiting incipient differentiation of myoepithial cells (neuro-muscular cells of HYDROZOA, *loc. cit.* p. 549). At the parting of the ways which led, on the one hand, to modern Scyphomedusæ, on the other to Anthozoa (III.), it is probable that the common ancestor was marked by incipient mesenteries and by the limitation of the sexual cells to endoderm. The lines of descent—II. to Hydromedusæ, and III. to Scyphomedusæ—represent periods during which the hypothetical ancestors II. and III., capable of either locomotion or fixation at will, were either differentiated into alternating generations of fixed sterile nutritive hydroids (scyphistomoids) and locomotor sexual medusoids, or abandoned the power of fixation in hypogenetic cases. During the period represented by the line of descent—III. to Anthozoa—this group abandoned its power of adult locomotion by swimming. During these periods were also attained those less important structural characters which these three groups present to-day. (G. H. FO.)

**Cognac,** chief town of arrondissement, department of Charente, France, 32 miles west by north of Angoulême, by rail. Large quantities of brandy and wine are exported to England, America, and Australia, and the total trade in alcoholic liquors of Cognac alone has a mean annual value of £1,200,000. Population (1881), 13,096; (1896), 18,932.

**Cohn, Ferdinand** (1828–1898), German botanist, was born on 24th January 1828 at Breslau. He was educated at Breslau and Berlin, subsequently being Professor of Botany at Breslau University. He had a remarkable career owing to his Jewish origin. He was contemporary with Pringsheim, and worked with Goeppert, Nees von Esenbeck, Ehrenberg, and Johannes Muller. At an early date he exhibited astonishing ability with the microscope, which he did much to improve, and his researches on cell-walls and the growth and contents of plant-cells soon attracted attention, especially as he made remarkable advances in the establishment of an improved cell-theory, discovered the cilia in, and analysed the movements of, zoospores, and pointed out that the protoplasm of the plant-cell and the sarcode of the zoologists were one and the same physical vehicle of life. Although these early researches were especially on the Algæ, in which group he instituted marked reforms of the rigid system due to Kutzing, Cohn had already displayed that activity in various departments which made him so famous as an all-round naturalist, his attention at various times being turned to such varied subjects as *Aldorovanda*, torsion in trees, the nature of waterspouts, the effects of lightning, physiology of seeds, the proteid crystals in the potato, which he discovered, the formation of travertin, the rotatoria, luminous worms, &c. &c., the mere notice of which would carry us too far.

It is, however, in the introduction of the strict biological and philosophical analysis of the life-histories of the lower and most minute forms of life that Cohn's greatest achievements consist, for he applied to these organisms the principle that we can only know the phases of growth of microscopic plants by watching every stage of development under the microscope, just as we learn how different are the youthful and adult appearances of an oak or a fern by direct observation. The success with which he attempted and carried out the application of cultural and developmental methods on the Algæ, Fungi, and Bacteria can only be fully appreciated by those familiar with the minute size and elusive evolutions of these organisms, and with the limited appliances at Cohn's command. Nevertheless his account of the life-histories of *Protococcus* (1850), *Stephanosphæra* (1852), *Volvox* (1856 and 1875), *Hydrodictyon* (1861), and *Sphæroplea* (1855–57) among the Algæ have never been put aside. The first is a model of what a study in development should be; the last shares with Thuret's studies on *Fucus* and Pringsheim's on *Vaucheria* the merit of establishing the existence of a sexual process in Algæ. Among the Fungi Cohn contributed important researches on *Pilobolus* (1851), *Empusa* (1855), *Tarichium* (1869), as well as valuable work on the nature of parasitism of Algæ and Fungi.

It is as the founder of bacteriology that Cohn's most striking claims to recognition will be established. He seems to have been always attracted particularly by curious problems of fermentation and coloration due to the most minute forms of life, as evinced by his papers on *Monas prodigiosa* (1850) and "Ueber blutähnliche Färbungen" (1850), on infusoria (1851 and 1852), on organisms in drinking-water (1853), "Die Wunder des Blutes" (1854), and had already published several works on insect epidemics (1869–70) and on plant diseases, when his first specially bacteriological memoir (*Crenothrix*) appeared in the journal (*Beiträge zur Biologie*) which he then started (1870–71), and which has since become so renowned. Investigations on other branches of bacteriology soon followed, among which "Organismen der Pockenlymphe" (1872), "Untersuchungen über Bacterien," I. (1872), II. (1875), IV. (1876), are most important, and laid the foundations of the new department of science which has now its own laboratories, literature, and votaries specially devoted to its extension in all directions. When it is remembered that Cohn brought out and helped Koch in publishing his celebrated paper on *Anthrax* (1876), the first clearly worked out case of a bacterial disease, the significance of his influence on bacteriology becomes apparent.

Among his most striking discoveries during his studies of the forms and movements of the Bacteria may be mentioned the nature of *Zooglœa*, the formation and germination of true spores,—which he observed for the first time, and which he himself discovered[1] in *Bacillus subtilis*,—and their resistance to high temperatures, and the bearing of this on the fallacious experiments supposed to support abiogenesis; as well as works on the bacteria of air and water, the significance of the bright sulphur-granules in sulphur bacteria, and of the iron-oxide deposited in the walls of *Crenothrix*. His discoveries in these and in other departments all stand forth as mementoes of his acute observation and reasoning powers, and the thoughtful (in every sense of the word) consideration of the work of others, and suggestive ideas attached to his principal papers, bear the same characteristics. If we overcome the always difficult task of bridging in imagination the interval between our present platform of knowledge and that on which bacteriologists stood in, say, 1870, we shall not undervalue the important contributions of Cohn to the overthrow of the then formidable bugbear known as the doctrine of "*Spontaneous Generation*," a dogma of despair calculated to impede progress as much in its day as that of "*Vitalism*" did in other periods. Cohn had also clear perceptions of the important bearings of Mycology and Bacteriology in infective diseases, as shown by his studies in insect-killing fungi, microscopic analysis of water, &c. He was a foreign member of the Royal Society and of the Linnean Society, and received the gold medal of the latter in 1895. He died in 1898. Lists of his papers will be found in the *Catalogue of Scientific Papers of the Royal Society*, and in *Ber. d. d. bot. Gesellsch.*, 1899, vol. xvii. p. (196). The latter also contains (p. (172)) a full memoir by F. Rosen. (H. M. W.)

**Cohoes,** a city of Albany county, New York, U.S.A., situated in 42° 46′ N. lat. and 73° 42′ W. long., in the eastern part of the state. Two railways enter the city—the Delaware and Hudson and the New York Central and Hudson River. It was built for manufacturing purposes at the Falls of the Mohawk, which furnish power. In 1890 there was an invested capital of $11,275,137, employing 8939 persons, with a product amounting to $10,836,260. Of this amount one-half was represented by hosiery and knit goods, for which the place is famous. Population (1880), 19,416; (1890), 22,509; (1900), 23,910.

**Coimbatore,** a town and district of British India, in the Madras Presidency. The town is situated on the left bank of the Noyil river, 304 miles by rail from Madras. In 1881 it had a population of 38,967, in 1891 of 46,383, and in 1901 of 52,931, showing an increase of 14 per cent. The municipal income in 1896–97 was Rs.55,730. The town stands 1437 feet above sea-level, and is well laid out and healthy. It has a station on the Nilgiri branch of the Madras Railway. It has two aided colleges, three high schools with 1185 pupils, several

[1] In August 1872 Cohn wrote: "So hat sich bei den Bakterien überhaupt keine eigentliche Fortpflanzung (Ei- oder Sporen- bildung) bis jetzt nachweisen lassen" (Beitr. B. i. H. 2, p. 179). In 1876 (Beitr. B. ii. H. 2, p. 263) he described the spores and their formation in *B. subtilis*.

missionary bodies and literary institutions, and four printing-presses. There is one cotton mill, with 20,384 spindles, employing 1000 hands.

The DISTRICT OF COIMBATORE has an area of 7860 square miles. The population in 1891 was 2,004,839, being 255 persons per square mile. In 1901 the population was 2,202,312, showing an increase of 10 per cent. The land revenue and rates were Rs.33,82,127, the incident of assessment being R. 1-2-5 per acre; the number of police was 906. In 1897–98, out of a total cultivated area of 2,266,851 acres, 390,262 were irrigated, including 74,973 from Government canals. The principal crops are millet, rice, other food grain, pulse, oilseeds, cotton, and tobacco, with a little coffee. Forests cover nearly $1\frac{1}{2}$ million acres, yielding valuable timber (teak, sandal-wood, &c.), and affording grazing ground for cattle. There are eight factories for pressing cotton, and two for cleaning coffee, two oilcake presses, three tanneries with an outturn valued at Rs.50,00,000, a sugar refinery, and 822 saltpetre refineries. The south-west line of the Madras Railway runs through the district. In 1896–97 the number of schools was 1242, attended by 35,477 pupils, being one pupil to every 57 of the total population. The registered death-rate in 1897 was 20·1 per thousand.

**Coimbra,** a city and episcopal see of Portugal, capital of district Coimbra, on the right bank of the Mondego, about 24 miles above its mouth. It has a scientific and literary institute. The average attendance at the university is 1350 students annually. There are manufactures of earthenware, hats, and leather; and lamprey fishing is important. Population (1900), 18,424. The district of Coimbra has an area of 1499 square miles, and a population of 333,505, giving a density of 211 inhabitants to the square mile. It has a fertile soil, and produces millet and wine, and possesses large herds of cattle. At Cape Mondego coal is mined.

**Coinage.** See NUMISMATICS.

**Coire,** or CHUR (often now spelt "Cur"), the capital of the Swiss canton of the Grisons or Graubunden. It is 1952 feet above the level of the sea. The new Raetian Museum has many antiquities, books, &c., relating to ancient Raetia, and includes also the geological collection of the monk Placidus à Spescha, who about 100 years ago thoroughly explored his native country. Father Theodosius, the founder of the hospital, died in 1865, and has a monument in front of the cathedral. Population, 9259 in 1888, and 11,513 in 1900. In 1888 Coire contained 6518 Romanists and 2729 Protestants, while 7799 spoke German and 1158 Romonsch. The see of Coire dates probably from the second half of the 4th century, and the first known bishop, Asimo, is mentioned in 455. In the troubled times of the 8th century the bishops were also great temporal lords, while in 831 Louis the Pious granted the bishop "immunity" for his territories, so that henceforth he was dependent simply on the empire. In 1170 he became a prince of the holy Roman Empire, and later extended his power over many of the neighbouring regions. In 1392 he became the chief of the "League of the House of God," originally formed in 1367 against him by his chapter, the city of Coire, &c. In 1526, by the "articles of Ilanz," the bishop lost all his temporal possessions and rights, having, so to speak, fulfilled his historical rôle of bringing together the elements of one of the three Raetian leagues that in 1803 formed the canton of the Grisons. The guild constitution of the city of Coire lasted from 1465 to 1839.

**Colchester,** a municipal and parliamentary borough (coextensive; since 1885 returning only one member) and seaport of Essex, England, on the Colne and the Great Eastern Railway. The ancient church of the Holy Trinity has been restored, and St Runwald's removed. Recent erections are a new bridge over the Colne, assembly rooms, a corn exchange, a town-hall, a technical and university extension college, a drill-hall, a reading-room, a library, a dozen almshouses, and a new cattle market. The Essex and Colchester general hospital has been enlarged. Castle Park, of 9 acres, containing Colchester Castle, was opened in 1892. The harbour was taken over by the corporation in 1898. The oyster fisheries belonging to the corporation are held on a ninety-nine years' lease by the Colne Fishery Company, incorporated under an Act of 1870. The registered shipping at the end of 1900 consisted of 157 vessels of 4717 tons. In 1900, 537 vessels of 38,731 tons entered, and 505 of 34,338 tons cleared. These entrances and clearances do not include those of vessels trading between Colchester and London or other ports on the estuary of the Thames. Area, 11,331 acres. Population (1881), 28,374; (1891), 34,559; (1901), 38,351.

**Colchester,** a town of Chittenden county, Vermont, U.S.A., on the Lake Champlain. The principal village of the town is Winooski, on Onion river, a few miles above its mouth, and on the Central Vermont Railway, at an altitude of 326 feet. Population (1880), 4421; (1890), 5143; (1900), 5352.

**Cold Harbor,** a village of Hanover county, Virginia, U.S.A., 10 miles north-east of Richmond. It was the scene of a succession of battles, June 1, 2, and 3, 1864, between the Union army under Grant and the Confederate forces under Lee. The Union troops, who took the offensive in most of the fighting, lost heavily, the total number being reported at 12,738.

**Cold Storage.** See REFRIGERATING MACHINERY.

**Coldwater,** capital of Branch county, Michigan, U.S.A., situated in the south of the lower peninsula, on the east branch of Coldwater river, and on the Lake Shore and Michigan Southern Railroad, at an altitude of 982 feet. Population (1880), 4681; (1900), 6216.

**Cole, Sir Henry** (1808–1882), the English public servant whose name will always be associated with the early organization of "South Kensington," was born at Bath on 15th July 1808, and was the son of an officer in the army. At the age of fifteen he became clerk to Sir Francis Palgrave, then a subordinate officer in the Record Office, and, helped by Charles Buller, to whom he had been introduced by Thomas Love Peacock, and who became chairman of a Royal Commission for inquiry into the condition of the public records, worked his way up until he became an assistant keeper. He largely assisted in influencing public opinion in support of Sir Rowland Hill's reforms at the Post Office. A connexion with the Society of Arts caused him to drift gradually out of the Record Office: he was a leading member of the Commission that organized the great Exhibition of 1851, and upon the conclusion of its labours was made secretary to

the School of Design, which by a series of transformations became in 1853 the Department of Science and Art. Under its auspices the South Kensington Museum was founded in 1855 upon land purchased out of the surplus of the Exhibition, and Cole practically became its director, retiring in 1873. His proceedings were frequently criticized, but the Museum owes everything to his energy. Indefatigable, genial, and masterful, he drove everything before him, and by all sorts of schemes and devices built up a great institution, whose variety and inequality of composition seemed imaged in the anomalous structure in which it was temporarily housed. He also, though to the financial disappointment of many, conferred a great benefit upon the metropolis by originating the scheme for the erection of the Royal Albert Hall. He was active in founding the national training schools for cookery and music, the latter the germ of the Royal College of Music. He edited the works of his benefactor Peacock; and was in his younger days largely connected with the press, and the author of many useful topographical handbooks published under the pseudonym of "Felix Summerly." He died on 18th April 1882. (R. G.)

**Cole, Vicat** (1833–1893), English painter, born at Portsmouth on 17th April 1833, was the son of the landscape painter, George Cole, and in his practice followed his father's lead with marked success. He exhibited at the British Institution at the age of nineteen, and was first represented at the Royal Academy in 1853. His election as an Associate of this institution took place in 1870, and he became an Academician ten years later. He died in London on 6th April 1893. The wide popularity of his work was due partly to the simple directness of his technical method, and partly to his habitual choice of attractive material. Most of his subjects were found in the counties of Surrey and Sussex, and along the banks of the Thames. One of his largest pictures, "The Pool of London," was bought by the Chantrey Fund Trustees in 1888, and is now in the National Gallery of British Art.

See Robert Chignell. *The Life and Paintings of Vicat Cole, R.A.* London, 1899.

**Colenso, John William** (1814–1883), Bishop of Natal, was born at St Austell, Cornwall, on 24th January 1814. His family were in embarrassed circumstances, and he was indebted to relatives for the means of university education. Second Wrangler at Cambridge, and Fellow of St John's College, his mathematical distinction led him to be invited to Harrow in 1837, but the step proved an unfortunate one. The school was just then at the lowest ebb under an unpopular headmaster, and Colenso not only got few pupils, but lost most of his property by a fire which destroyed his house. He went back to Cambridge, and in a short time paid off heavy debts by diligent tutoring, and the proceeds of his marvellously successful series of manuals of algebra and arithmetic, which were adopted all over England. In 1846 he became rector of Forncett St Mary, Norfolk, and in 1853 was appointed Bishop of Natal. Full of zeal, he devoted himself on his arrival to acquiring the native language, of which he compiled a grammar and dictionary, and into which he translated the New Testament and other portions of Scripture. His ardour, however, was soon diverted into another channel by the puzzling objections of natives, who convinced him that the verbal inspiration and Mosaic authorship of the Pentateuch could not be maintained. Colenso brought his arithmetical attainments to bear upon the question, and published his conclusions, positive and negative, in a series of treatises on the Pentateuch, extending from 1862 to 1879. His conclusions were naturally disputed with a fervour of conviction equal to his own. While controversy raged in England, the South African bishops, whose suspicions Colenso had already incurred by the liberality of his views respecting polygamy among native converts and a commentary upon Romans alleged to savour of heresy, met in conclave to condemn him, and pronounced his deposition (December 1863). Colenso, who had refused to appear before their tribunal otherwise than as sending a protest by proxy, appealed to the Privy Council, which pronounced that the Cape Town Metropolitan had no coercive jurisdiction and no authority to interfere with the Bishop of Natal. No decision, therefore, was given upon the merits of the case; but it is significant that although many eminent clergymen have since expressed views agreeing in essentials with Bishop Colenso's, no prosecution has been instituted against any of them. His adversaries, though unable to obtain his condemnation, succeeded in causing him to be generally inhibited from preaching in England, and set up a rival bishop in Natal, who, however, assumed a different title. The contributions of the missionary societies were withdrawn, but an attempt to deprive him of his episcopal income was frustrated by a decision of the Courts. Colenso, encouraged by a handsome testimonial raised in England, to which many clergymen subscribed, returned to his diocese, and devoted the latter years of his life to further labours as Biblical commentator and translator, and especially to the defence of the natives against what he considered oppression and wrong. By this course he made more enemies among the colonists than he had ever made among the clergy. He died at Durban on 20th June 1883. The character of the man and of his works are summed up in ten words of Jowett: "He has made an epoch in criticism by his straightforwardness." (R. G.)

**Coleraine,** a maritime town and urban sanitary district, in the county of Londonderry, Ireland, on the river Bann and the Belfast and Northern Counties Railway, 145 miles north of Dublin. It ceased to be a parliamentary borough in 1885. The harbour has been much improved from grants by the Irish Society of London and from a loan under the River Bann Navigation Act, 1879. In all 420 vessels of 46,526 tons entered in 1899, and 256 of 32,631 tons cleared. The number of persons employed in the salmon fishery district in 1899 was 731. Population (1881), 6694; (1891), 6845; (1901), 6929.

**Coleridge, John Duke Coleridge,** 1st Baron (1820–1894), Lord Chief Justice of England, was the eldest son of Sir John Taylor Coleridge (see *Ency. Brit.*, 9th edition, vol. vi. p. 135). He was born at Heath's Court, Ottery St Mary, on the 3rd of December 1820. He was educated at Eton, an institution which, as managed in the 'thirties, sent most of its pupils into the world slenderly enough equipped for the battle of life. It was otherwise in the case of Coleridge, the system then prevailing, with its worship of Latin verses and the elegancies of classic scholarship in general, being just suited to bring out the rhetorical talents which did so much to make his fame; but he owed even more to his innate love of letters than he did to any formal teaching. He gained a scholarship at Balliol, and entered that college at a very auspicious moment, for the scholars' table there has never been occupied by a more brilliant company. The late Principal Shairp of St Andrews published in the year 1873 a poem called "The Balliol Scholars from 1840–43," which well described it.

Here is the sketch of Coleridge as he appeared to a contemporary:—

Fair-haired and tall, slim but of stately mien,
  Inheritor of a high poetic name,
Another, in the bright bloom of nineteen,
  Fresh from the pleasant fields of Eton came:
Whate'er of beautiful or poet sung
Or statesman uttered, round his memory clung;
  Before him shone resplendent heights of fame.

With friends around the board, no wit so fine
  To wing the jest, the sparkling tale to tell;
Yet ofttimes listening in St. Mary's shrine,
  Profounder moods upon his spirit fell:
We heard him then, England has heard him since,
Uphold the fallen, make the guilty wince,
  And the hushed Senate have confessed the spell.

The other Balliol scholars celebrated in the same poem were Clough, Pritchard, Archbishop Temple of Canterbury, Riddell, Matthew Arnold, and Seymour. The last of these, a man of very great promise, died early at Laibach in Carniola. His sister was Coleridge's first wife; they were married when Coleridge was only five and twenty, and just about the same time he was called to the Bar. Coleridge used to say that the difference between his father and himself was that the former had started in life with a thousand pounds he had borrowed, while, with better fortune, he had started with a thousand pounds of his own. He was called to the Bar on 6th November 1846, and went the Western Circuit, rising steadily, through more than twenty years of hard work, till in July 1865 he was returned as member for Exeter in the Liberal interest. The impression which he made on the heads of his party was so favourable that they determined, early in the session of 1867, to put him forward as the protagonist of their attack on the Conservative Government. But that move seemed to many of their staunchest adherents unwise, and it was frustrated by the active opposition of a section, including Hastings Russell (later ninth duke of Bedford), his brother Arthur, member for Tavistock, Alexander Mitchell of Stow, Kinglake, and Henry Seymour. They met to deliberate in the Tea-room of the House, and were afterwards sometimes confounded with the Tea-room party which was of subsequent formation and under the guidance of a different group. The protest was sufficient to prevent the contemplated attack being made, but the Liberals returned to power in good time with a large majority behind them in 1868. Coleridge was made, first, Solicitor-, and then Attorney-General.

As early as 1863 a small body of Oxford men in Parliament had opened fire against the legislation which kept their University bound by ecclesiastical swaddling clothes. They had made a good deal of progress in converting the House of Commons to their views before the General Election of 1865. That election having brought Coleridge into Parliament, he was hailed as a most valuable ally, whose great University distinction, brilliant success as an orator at the Bar, and hereditary connexion with the High Church party, entitled him to take the lead in a movement which, although gathering strength, was yet very far from having achieved complete success. The clerically-minded section of the Conservative party could not but listen to the son of Sir John Coleridge, the godson of Keble, and the representative of the man who had been the indirect cause of the Anglican revival of 1833,—for John Stuart Mill was right when he said that Coleridge and Bentham were, so far as England was concerned, the leaders of the two chief movements of their times: "it was they who taught the teachers, and who were the two great seminal minds."

Walking up one evening from the House of Commons to dine at the Athenæum with Henry Bruce (afterwards Lord Aberdare) and another friend, Coleridge said: "There is a trial coming on which will be one of the most remarkable *causes célèbres* that has ever been heard of." This was the Tichborne case, of which so much was said ere many weeks had passed over, and which led to proceedings in the criminal courts rising almost to the dignity of a political event. These two trials were the most conspicuous features of Coleridge's later years at the Bar, and tasked his powers as an advocate to the uttermost, though he was assisted by the splendid abilities and industry of Charles (afterwards Lord) Bowen. In November 1873 Coleridge succeeded Sir W. Bovill as Chief Justice of the Common Pleas, and was immediately afterwards raised to the Peerage as Baron Coleridge of Ottery St Mary. In 1880 he was made Lord Chief Justice of England on the death of Sir Alexander Cockburn.

In jury cases his quickness in apprehending facts and his lucidity in arranging them were very remarkable indeed. He was not one of the most learned of lawyers, but he was a great deal more learned than many people believed him to be, and as an ecclesiastical lawyer had perhaps few or no superiors. His fault—a natural fault in one who had been so successful as an advocate—was that of being too apt to take one side. He allowed, also, certain political or class prepossessions to interfere somewhat with the even course of justice. A game-preserving landlord had not to thank the gods when his case, however buttressed by undoubted right, came before Coleridge. Towards the end of his life his health failed, and he became somewhat indolent. On the whole, he was not so strong a man in his judicial capacity as Campbell or Cockburn; but when all has been said that could reasonably be said in his disparagement, even Rhadamanthus would have to admit that his scholarship, his refinement, his power of oratory, and his character raised the tone of the Bench while he sat upon it, and that if it has been adorned by greater judicial abilities, it has hardly ever been adorned by a greater combination of varied merits. It is curious to observe that of all judges the man whom he put highest was one very unlike himself, the great Master of the Rolls, Sir William Grant. He died in harness. Early in the 'nineties his friends could see that he began to feel his age. He made, indeed, no secret of it; but he might have lasted a little longer if a summer cold had not precipitated the end. He died on 14th June 1894.

Coleridge's work, first as a barrister and then as a judge, prevented his publishing as much as he otherwise would have done, but his addresses and papers would, if collected, fill several volumes and do much honour to his memory. One of the best, and one most eminently characteristic of the man, was his Inaugural Address to the Philosophical Institution at Edinburgh in 1870. He was an exceptionally good letter-writer. Of travel he had very little experience. He had hardly entered Paris; once, quite near the end of his career, he spent a few days in Holland, and came back a willing slave to the genius of Rembrandt; but his longest absence from England was a visit to the United States, which had something of a business character. It is strange that a man so steeped in Greek and Roman poetry, so deeply interested in the past, present, and future of Christianity, never saw Rome, or Athens, or the Holy Land. The chief cause, no doubt, was the fatal custom of neglecting modern languages at English schools. He felt himself at a disadvantage when he passed beyond English-speaking lands, and cordially disliked the situation. No notice of Coleridge can omit to make mention of his extraordinary store of anecdotes, which were nearly always connected with Eton, Oxford, the Bar, or the Bench. His exquisite voice, considerable

power of mimicry, and perfect method of narration added greatly to the charm. He once told, at the table of Dr Jowett, Master of Balliol, anecdotes through the whole of dinner on Saturday evening, through the whole of breakfast, lunch, and dinner the next day, through the whole journey on Monday morning from Oxford to Paddington, without ever once repeating himself. He was frequently to be seen at the Athenæum, was a member both of Grillion's and The Club, as well as of the Literary Society, of which he was president, and whose meetings he very rarely missed. Bishop Copleston is said to have divided the human race into three classes,—men, women, and Coleridges. If he did so, he meant, no doubt, to imply that the men of the family whose chief example was the poet of "Christabel" had a certain feminine charm combined with a trace of feminine weakness. In John Duke Coleridge the charm was certainly present.

Coleridge's first wife died in 1878. She was an artist of real genius, and her portrait of Cardinal Newman was considered much better than the one by Millais. A short notice of her by Dean Church of St Paul's was published in the *Guardian* on 13th February 1878, and was reprinted in her husband's privately printed collection of poems. Coleridge remained for many years a widower, but married in 1886 Amy Augusta Jackson Lawford, daughter of Henry Baring Lawford, Esq., who survived him. He was succeeded in the peerage by his eldest son, Bernard John Seymour. (M. G. D.)

**Colfax, Schuyler** (1823–1885), vice-president of the United States, was born in New York City on the 23rd of March 1823, and died in Mankato, Minn., 13th January 1885. After a meagre education he served as a clerk in Indiana, and then turned to journalism. From 1855 to 1869 he was a Republican representative in Congress from Indiana. In 1863 he was elected Speaker of the House, and served for three terms. In 1868 he was elected vice-president on the ticket with General Grant. Owing to his alleged connexion with the corrupt distribution of shares of stock in the Crédit Mobilier he was not renominated. In later years he was best known as a popular lecturer.

**Colima,** one of the smallest states of Mexico, bounded by the state of Jalisco on the N., N.E., and W., by that of Michoacan on the E., and by the Pacific on the S., with an area of 2273 square miles, including the islands of Revill Gigedo. The population in 1879 was 65,827, and in 1895 it was 55,752. The principal industries are agriculture, stock-raising, and the exploitation of the salt deposits; the products are coffee, cacao, tobacco, rice, cotton, indigo, sugar-cane, cereals, and leguminous plants. The state is divided into three *partidos* and seven municipalities. The capital, Colima, 570 miles from Mexico City, has a population of 18,977, and is situated in a beautiful and fertile valley, irrigated by the Colima river. The city has good public buildings, a cathedral, theatre, and a fine market-house. It has tramways and an electric light system. Amongst other towns are Manzanillo, Coquimatlan, Ixtahuacan, Almoloyan, Comala.

**Colle di Val d'Elsa,** a town and episcopal see of the province of Siena, Tuscany, Italy, 21 miles north-west from Siena, 13 by rail to Poggibonsi. It consists of two quarters, the upper old town, with a 13th-century cathedral, and the lower new town, with busy ironworks, glass, pottery, paper, and brick factories. There is a technical school (1873). Here the Florentines defeated the Sienese in 1269. Population, about 6000.

**College Point,** formerly a village of Queens county, New York, U.S.A., but since January 1, 1898, a part of the borough of Queens, one of the five boroughs constituting the city of New York; on the east shore of Flushing Bay, an arm of Long Island Sound. Population (1880), 4192; (1890), 6127. (See New York City.)

**Colley, Sir George Pomeroy** (1835–1881), British general, third son of George Pomeroy Colley of Rathangan, Co. Kildare, Ireland, and grandson of the fourth Viscount Harberton, was born on the 1st of November 1835, and entered the 2nd Queen's Regiment from Sandhurst as ensign in 1852. From 1854 to 1860 he served in South Africa, and was employed in surveying and as a magistrate in charge of the Bashi river district in Kaffraria. Early in 1860 he went with his regiment to China to join the Anglo-French Expedition, and took part in the capture of the Taku Forts and the entry into Peking (medal and clasp), returning to South Africa to complete his work in Kaffraria (brevet-majority). In 1862 he entered the Staff College and passed out in one year with honours. After serving as brigade-major at Devonport for five years he went to the War Office in 1870 to assist in the preparation of Mr Cardwell's measures of army reform. He was appointed professor of military administration at the Staff College in 1871. Early in 1873 he joined Sir Garnet Wolseley at the Gold Coast, where he took charge of the transport, and the success of the Ashanti Expedition was in no small degree due to his exertions (medal, brevet colonelcy, and C.B.). In 1875 he accompanied Wolseley to Natal (C.M.G.). On his return home he was appointed military secretary to Lord Lytton, Governor-General of India, and in 1877 private secretary (K.C.S.I.). In 1879 he joined Wolseley as Chief of the Staff and Brigadier-General in S.E. Africa, but, on the murder of Cavagnari at Kabul, returned to India. In 1880 he succeeded Wolseley in S.E. Africa as High Commissioner and General Commanding, and conducted the operations against the rebel Boers. He was defeated at Lang's Nek and at the Ingogo river, and killed at Majuba Hill on 27th February 1881. Colley contributed to periodical literature, and wrote the article "Army" in the ninth edition of the *Encyclopædia Britannica*. He had a very high reputation not only for a theoretical knowledge of military affairs, but also as a practical soldier; and his disastrous failure against the Boers completely upset all the estimates that had been made of his abilities.

**Collier, John Payne** (1789–1883), English critic, was born in London, 11th January 1789. His father's connexion with the press obtained for him a position on the *Morning Chronicle* as leader writer, dramatic critic, and reporter, which continued till 1847; he was also called to the Bar. All the time he could spare, however, was given to the study of Shakespeare and the early English drama. After some minor publications he produced, in 1831, his *History of English Dramatic Poetry and Annals of the Stage*, a badly arranged but valuable work. It obtained for him the post of librarian to the duke of Devonshire, and access to the chief collections of early English literature throughout the kingdom. These opportunities were unhappily misused to effect a series of literary fabrications, which may be charitably, and perhaps not unjustly, attributed to literary monomania, but of which it is difficult to speak with patience, so completely did they for a long time bewilder the chronology of Shakespeare's writings, and such suspicion have they thrown upon MS. evidence in general. After *New Facts*, *New Particulars*, and *Further Particulars* respecting

Shakespeare had appeared and passed muster, Collier produced (1852) the famous *Perkins Folio*, claiming to possess numerous MS. emendations of Shakespeare by "an old corrector." The authenticity of these was disputed in several quarters on internal evidence; and when in 1859 they were submitted to experts at the British Museum they were incontestably proved to be forgeries. The point whether Collier was deceiver or deceived was left undecided, but it must be feared that the falsifications of which he was unquestionably guilty among the MSS. at Dulwich College have left little doubt respecting it. Apart from these unhappy mystifications, which have thrown so much suspicion upon his antiquarian work that no statement of his can be accepted without verification, his literary career was useful and honourable. He published excellent editions of Shakespeare and Spenser, reprinted a great number of early English tracts of extreme rarity, and rendered good service to the numerous antiquarian societies with which he was connected. His *Old Man's Diary* is an interesting record, though even here the taint of fabrication is not absent. Unfortunately what he did amiss is more striking to the imagination than what he did aright, and he will be chiefly remembered by it. He was active with his pen almost to the end of his life; and died at Maidenhead, where he had long resided, on 17th September 1883. (R. G.)

**Collingwood,** a town and railway station of Simcoe county, Ontario, Canada, 71 miles north-north-west of Toronto, on Lake Huron. It is the eastern terminus of two lines of steamers plying to Lake Huron and Lake Superior ports. It contains a large stone dry-dock and shipyard, pork factory, and saw and planing mills, and has a large lumber, grain, and produce export trade, besides large shipbuilding plant and steel works. Exports for the year 1899–1900 were valued at $2,657,413; imports at $277,770. Population (1881), 4435; (1900), 5587.

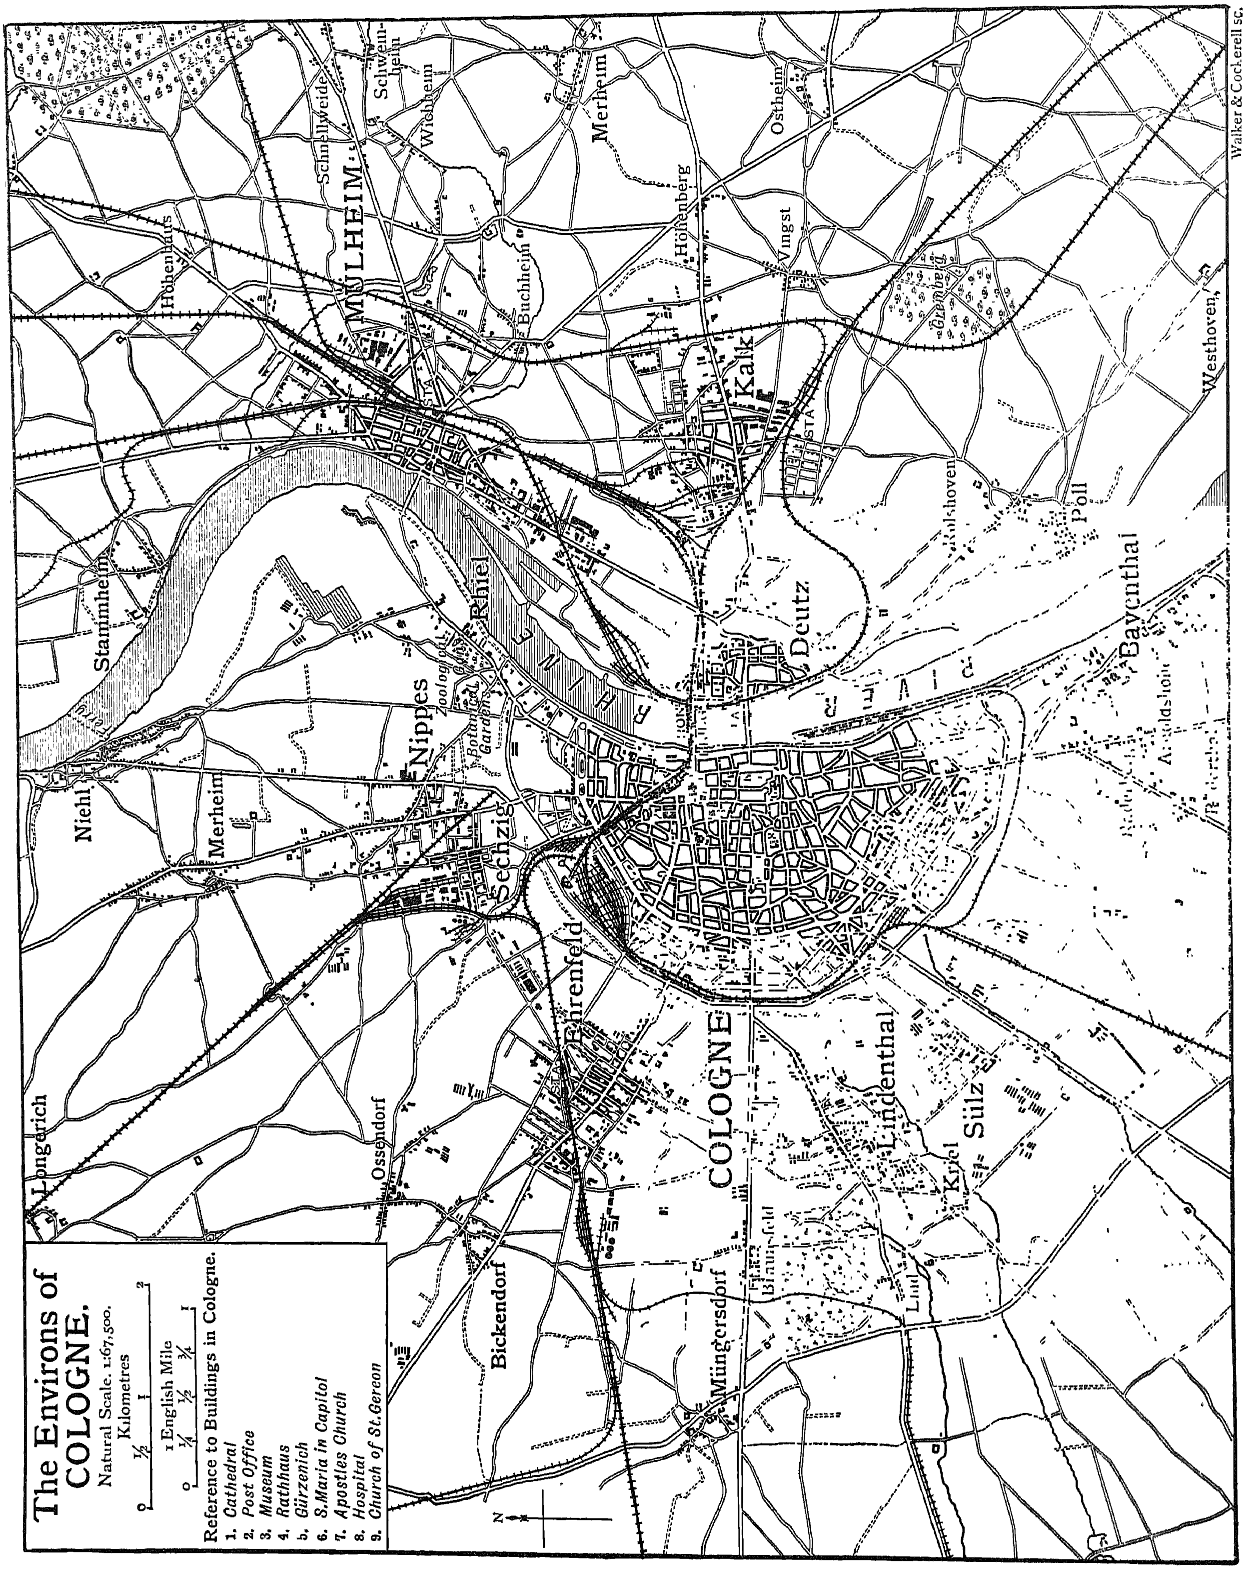
**Collins, William Wilkie** (1824–1889), English novelist, the elder son of William Collins, R.A., the well-known landscape painter, was born in London, 8th January 1824. He was educated at a private school in Highbury, and when only a small boy of twelve was taken by his parents to Italy, where the family lived for three years. On their return to England Wilkie Collins was articled to a firm in the tea trade, but four years later he abandoned that business for the law. He found little pleasure in his new career, however; though what he learned in it was exceedingly valuable to him later. On his father's death in 1847 young Collins made his first essay in literature, publishing the *Life of William Collins*, in two volumes, in the following year. This gave him an incentive towards writing, and in 1850 he put forth his first work of fiction, *Antonina, or the Fall of Rome*, which was clearly inspired by his life in Italy. *Basil* appeared in 1852, and *Hide and Seek* in 1854. About this time he made the acquaintance of Charles Dickens, and began to contribute to *Household Words*, where *After Dark* (1856) and *The Dead Secret* (1857) ran serially. His great success was achieved in 1860 with the publication of *The Woman in White*, which was first printed in *All the Year Round*. From that time he enjoyed as much popularity as any novelist of his day, and was continually employed in writing, *No Name* (1862), *Armadale* (1866), and *The Moonstone* (1868) being among his most successful achievements. The last-named story, for many of the details of which Collins was indebted to the curious history of the Road murder, is certainly the best detective novel ever written in the English language. After *The New Magdalen* (1873) his ingenuity became gradually exhausted, and his later stories were little more than faint echoes of earlier successes. He died in Wimpole Street, London, 23rd September 1889. Collins's gift was of the melodramatic order, and while many of his stories made excellent plays, several of them were actually reconstructed from pieces designed originally for stage production. But if his colours were occasionally crude, and his methods violent, he was at least a master of situation and effect. His trick of telling a story through the mouths of different characters is sometimes irritatingly disconnected; but it had the merit of giving an air of actual evidence and reality to the elucidation of a mystery. He possessed in the highest degree the gift of absorbing interest; the turns and complexities of his plots are surprisingly ingenious, and many of his characters are not only real, but uncommon. Count Fosco in *The Woman in White* is perhaps his masterpiece; the character has been imitated again and again, but no imitation has ever attained to the subtlety and humour of the original. (A. WA.)

**Colmar,** a town of Germany, in the imperial territory of Alsace-Lorraine, district of Upper Alsace, 40 miles south-south-west from Strasburg by the railway to Basel. The town still has numerous narrow and picturesque streets, with good houses of the 16th and 17th centuries. It is the seat of several textile industries, and manufactures sewing thread, starch, sugar, and machinery; there are also bleachfields, breweries, and cultivation of wine and fruit. Population (1885), 26,537; (1900), 36,824.

**Colne,** a municipal borough (1895) and market-town in the Clitheroe parliamentary division of Lancashire, England, 6 miles north-north-east of Burnley by rail. Area of borough, 5330 acres. Population (1901), 23,000.

**Cologne,** in German *Köln* (officially *Cöln*, since 1900), a town and archiepiscopal see of Prussia, in the Rhine province, on the left bank of the Rhine, by rail 44 miles east by north from Aix-la-Chapelle, 24 south by east from Düsseldorf, and 57 north-north-west from Coblenz. It is a much improved town, and is no longer distinguished by its smells as it used to be. In 1881–85 the old fortifications were dismantled and the site (bought by the municipality from the War Office for £600,000) converted into a fine boulevard, the Ring Street, nearly 4 miles long. Beyond the Ring Street now extends a new continuous line of fortifications, covering an area of 1000 acres, thus doubling the area of the city of Cologne. Within the outer municipal boundary are further included (1888) the suburbs of Bayenthal, Lindenthal, Ehrenfeld, Nippes, Deutz (on the opposite side of the river), Sülz, Bickendorf, Niel, and Poll, protected by another widely extended circle of detached forts on both banks of the Rhine. Of the former city gates four have been retained, restored, and converted into museums: the Severin gate, on the south, contains the geological section of the natural history museum; the Hahnen (cocks) gate, on the west, is fitted as the historical and antiquarian museum of the city; and the Eigelstein gate, on the north, accommodates the zoological section of the natural history museum. Along this same promenade are the technical trades school, the Roman Catholic church of the Heart of Jesus (1900), a monumental fountain to the memory of the Emperor William I. (1897), and the industrial art museum (1899–1900). The building of the cathedral was finally completed in 1880. It has since been supplied with fine bronze doors. The Great Bell (*Kaiserglocke*), cast in 1874, weighs 543 cwt., and is the largest and heaviest bell that is rung; it was put up in 1880. The view of the cathedral has been much improved by a clearance of the old houses in the Dom Platz, including the Archiepiscopal Palace. The new Platz is now flanked by fine buildings. Many new

churches have been built (*e.g.*, St Michael's, churches in Wiehl and in Riehl, the church of Christ, &c.), and several of the older churches have been more or less completely restored, *e.g.*, the church of the Apostles (1875–88 and 1895–97), St Peter (1890–92), St Ursula (1890–91), St Gereon, and St Cecilia. A handsome Roman



Catholic church was completed in Deutz in 1896; and in 1896–99 a large synagogue, west of the Ring. The church of St Andreas (1220 and 1414) contains the remains of Albertus Magnus in a gilded shrine. Turning to the secular buildings—the ground floor of the Gürzenich was in 1875 converted into a stock exchange, and in 1890–91 provided with a fine staircase. In the street Burgmauer stands the supreme court for the Rhine province, and off the street are the post office (1893), a fine early Gothic building, and the Imperial Bank (1897), also in the early Gothic style. Farther west is the municipal library and archives (1894–97), also Gothic.

A handsome central railway station (high level) was built in 1889–94. The railway now follows the line of the *ceinture* of the new inner fortifications, and there are three city stations in addition to the central. Like all important German towns, Cologne has of recent years been beautified by fine monuments. The most conspicuous is the colossal equestrian statue (22½ feet high) of Frederick William III. in the Heumarkt. There are also monuments to Moltke (1881), to Johann von Werth (1885), the cavalry leader of the Thirty Years' War, and to Bismarck (1879). Near the cathedral is an archiepiscopal museum of church antiquities. Cologne has, further, a large civic hospital, a conservatory of music, a commercial school (1900), a commercial high school (1901), a girls' commercial high school (1900), theological and teachers' seminaries, a girls' college (1900), and lunatic asylums. Commercially, Cologne is one of the chief centres on the Rhine, and has a very important trade in corn, wine, mineral ores, coals, drugs, dyes, manufactured wares, groceries, leather and hides, timber, porcelain, and many other commodities. A large new harbour, with spacious quays, has been constructed towards the south of the city. In 1898 a total of 3461 vessels of 1,323,800 tons entered and cleared the port. Industrially, too, Cologne is a place of very considerable importance. The manufacture of machinery, bricks, cottons and woollens, and india-rubber goods, and printing are carried on on a large scale, and there are factories for sugar, chocolate, and many others. The famous *Eau de Cologne* is produced in large quantities. Population (1885), 239,437; (1900), 370,685.

**Colomb, Philip Howard** (1831–1899), British vice-admiral, historian, critic, and inventor, the son of General T. Colomb, was born in Scotland, on the 29th of May 1831. He entered the Navy in 1846, and served first at sea off Portugal in 1847; afterwards he served, in 1848, in the Mediterranean, and from 1848–51 as midshipman of the *Reynard* in operations against piracy in Chinese waters; as midshipman and mate of the *Serpent* during the Burmese War of 1852–53; as mate of the *Phœnix* in the Arctic Expedition of 1854; as lieutenant of the *Hastings* in the Baltic during the Russian War, taking part in the attack on Sveaborg. He became what was known at that time as a "Gunner's Lieutenant" in 1857, and from 1859 to 1863 he served as flag-lieutenant to Rear-Admiral Sir Thomas Pasley at Devonport. Between 1858 and 1868 he was employed in home waters on a variety of special services, chiefly connected with gunnery, signalling, and the tactical characteristics and capacities of steam warships. From 1868 to 1870 he commanded the *Dryad*, and was engaged in the suppression of the slave trade. In 1874, while captain of the *Audacious*, he served for three years as flag-captain to Vice-Admiral Ryder in China; and finally he was appointed, in 1880, to command the *Thunderer* in the Mediterranean. Next year he was appointed captain of the Steam Reserve at Portsmouth; and after serving three years in that capacity, he remained at Portsmouth as flag-captain to the Commander-in-Chief until 1886, when he was retired by superannuation before he had attained flag rank. Subsequently he became Rear-Admiral, and finally Vice-Admiral on the retired list.

Few men of his day had seen more active and more varied service than Colomb. But the real work for the Navy on which his title to fame and remembrance rests was done in another sphere. He was, in his day, essentially the thinker of the service. Many of his contemporaries were his equals, not a few were his superiors, in the practical gifts and aptitude of the naval officer. But perhaps no officer of his time has left a more indelible mark on the thought and practice of the Navy. His mind was at once inquiring, aspiring, logical, reflective, and inventive. He was one of the first to perceive the vast and momentous changes which must ensue from the introduction of steam into the Navy. He foresaw that it must eventually carry all before it, that it would immensely increase the tactical mobility of ships, and would for that reason entail a complete revolution in the methods he found in use for the direction, conduct, and control of their movements—in other words, that it required a new system of signals and a new method of tactics. These he set himself to devise as far back as 1858. For the purposes of signalling Colomb adapted to naval use the methods employed by the electric telegraph. It is well known that for purposes of electric transmission the letters are represented by symbols composed of two elements variously combined, according to the Morse system. The idea of varying form is thus replaced by that of varying duration; and by suitable combinations of two intervals of different duration, one longer and one shorter, the whole alphabet and all numbers can be represented. If an electric current is continuous, its interruption for a longer or a shorter period can be made to represent the two intervals required, and the symbols thus transmitted to a distance can by suitable mechanism be recorded on paper in the form now universally known as "dots and dashes." Similarly, a beam of light can be made to transmit the same symbols to the eye by alternate periods, varying in duration, of occultation and display. Colomb invented a lantern for this purpose in 1861, but it was not adopted by the Navy until 1867. In some form or other it is now in use in every important navy in the world. In daytime a hand flagstaff, with flag attached, is made to transmit the required symbols by giving it a greater or less inclination from the perpendicular. In a fog, long and short blasts sounded on a fog-horn, steam-whistle, or steam-siren are employed for the same purpose. Before these methods were adapted by Colomb to naval use, the only signals employed were, in daytime, flags of different colours and shapes, and by night, lanterns variously disposed. In fog there was nothing, and at night the range of signalling was very restricted and its method very inefficient. Nowadays, thanks mainly to Colomb, and to others who have developed his methods on the same lines, it is almost as easy to manœuvre a fleet at night, or even in a thick fog, as it is in broad and clear daylight.

What he had done for signals Colomb next did for tactics. Having first determined by experiment—for which he was given special facilities by the Admiralty—what are the manœuvring powers of ships propelled by steam under varying conditions of speed and helm, he proceeded to devise a system of tactics based on these data. In the sequel he prepared a new evolutionary signal-book, which was adopted by the Royal Navy, and still remains in substance the foundation of the existing system of tactical evolutions at sea. The same series of experimental studies led him to conclusions concerning the chief causes of collisions at sea; and these conclusions, though stoutly combated in many quarters at the outset, have since been generally accepted, and were ultimately embodied in the International Code of Regulations now adopted by the leading maritime nations on the recommendation of a Conference held at Washington in 1889.

After his retirement Colomb devoted himself rather to the history of naval warfare, and to the large principles disclosed by its intelligent study, than to experimental inquiries having an immediate practical aim. As in his active career he had wrought organic changes in the ordering, direction, and control of fleets, so by his historic studies, pursued after his retirement, he helped greatly to effect, if he did not exclusively initiate, an equally moment-

ous change in the popular, and even the professional, way of regarding sea-power and its conditions. He did not invent the term "sea-power,"—it is, as is shown elsewhere (SEA-POWER), of very ancient origin,—nor did he employ it until Captain Mahan had made it a household word with all. But he thoroughly grasped its conditions, and in his great work on Naval Warfare (first published in 1891) he enunciated its principles with great cogency and with keen historic insight. The central idea of his teaching was that naval supremacy is the condition precedent of all vigorous military offensive across the seas, and, conversely, that no vigorous military offensive can be undertaken across the seas until the naval force of the enemy has been accounted for—either destroyed or defeated and compelled to withdraw to the shelter of its own ports, or at least driven from the seas by the menace of a force it dare not encounter in the open. This broad and indefeasible principle he enunciated and defended in essay after essay, in lecture after lecture, until what at first was rejected as a paradox came in the end to be accepted as a commonplace. He worked quite independently of Captain Mahan, and his chief conclusions were published before Captain Mahan's works appeared. In the last edition of *Naval Warfare* he showed how, in the Cuban War, Captain Mahan had been driven by force of circumstances to adopt in practice the sound doctrine of the Command of the Sea, which in some of his works he had seemed in some measure to impugn. There was no jealousy and no rivalry between these two great writers on the philosophy of naval warfare. They worked on independent lines—Colomb perhaps with deeper and more consistent thought, but Mahan assuredly with a broader historical outlook, and with finer powers of lucid and orderly exposition.

Colomb died quite suddenly and in the full swing of his literary activity on October 13, 1899, at Steeple Court, Botley, Hants. His latest published work was a biography of his friend Sir Astley Cooper Key, and his last article was a critical examination of the tactics adopted at Trafalgar, which showed his acumen and insight at their best. He left much valuable literary material in an unfinished state at his death. He was often thought too speculative, and even too visionary, by his contemporaries of a profession which is eminently practical, and little given to speculation even on the theory of its own occupation. He was indeed essentially a pioneer, and his larger range of thought often supplied the Navy with well-considered methods, of which practical men discerned neither the rationale nor the origin. But no naval officer of his time left a deeper or more lasting impression on the thought and action of the great service he adorned.

(J. K. L.)

**Colombes,** a town in the arrondissement of St Denis, department of Seine, France, 7 miles north-north-west of Paris, near the left bank of the Seine, and on the railway from Paris to Havre. It has a 16th-century church with 12th-century tower, numerous villa residences and boarding schools, and manufactures of gelatine and starch. A castle formerly stood here, in which died Henrietta Maria, queen of Charles I. of England and daughter of Henry IV. of France. Port traffic (1899), 55,350 tons. Population (1901), 23,061. The adjacent town of BOIS COLOMBES had a population (1896) of 10,404.

**Colombia,** a country of South America extending from 12° 20′ N. lat. to the still undefined boundaries of Ecuador, Peru, and Brazil. The boundary towards Venezuela, according to the arbitration of the Spanish Government in 1891, runs from the Bay of Calaboso westwards to the mountains of Oca, then southwards along the watershed between the Magdalena river and Lake Maracaibo as far as the Rio de Oro, whence it crosses the cordillera and follows successively the rivers Oira, Arauca, Meta, Orinoco, and Atabapo. Then it passes to the Piedra del Cocuy and follows the course of the Guainia to the frontier of Brazil. The boundary dispute with Peru and Ecuador was, by treaty of 1894, submitted to the arbitration of Spain. The question of the frontier towards Costa Rica was in 1899 submitted to the president of the French Republic, who gave his award on 15th September 1900. The boundary between the two republics is formed by the spur of the cordilleras starting from Cape Mona on the Atlantic and enclosing on the north the valley of the Rio Tarire, and by the watershed between the Atlantic and Pacific up to the parallel of 9° N. lat. It then follows the watershed between the Chiriqui Viejo and the affluents of the Dolce Gulf, ending at Burica Point on the Pacific. The islands east and south of Cape Mona are Colombian, to the west and north-west Costa Rican; but seven islands at a greater distance, lying between the Mosquito coast and the isthmus of Panama, are Colombian. On the Pacific coast Colombia possesses Burica and the islands to the east; Costa Rica, those to the west.

*Area and Population.*—According to a census taken in 1871 the total population was 2,951,323, consisting of 1,434,129 males and 1,517,194 females. An official estimate published in 1881, and considered to be approximately correct for the present date, gave the following details as regards area and population:—

| Departments. | Area in Square Miles. | Population in 1881. | Population per Square Mile. |
|---|---|---|---|
| Antioquia (1884) | 22,316 | 470,000 | 21 |
| Bolivar | 21,345 | 280,000 | 13 |
| Boyacá | 33,351 | 702,000 | 21 |
| Cauca | 257,462 | 621,000 | 2·4 |
| Cundinamarca (1884) | 79,810 | 569,000 | 7 |
| Magdalena | 24,440 | 90,000 | 3·7 |
| Panama | 31,571 | 285,000 | 9 |
| Santander | 16,409 | 555,000 | 35 |
| Tolima (1884) | 18,069 | 306,000 | 17 |
| Total | 504,773 | 3,878,000 | 7·7 |

This estimate includes some 220,000 uncivilized Indians, and the population of the different territories attached to departments. A later statement, published in 1893, estimates the total population at 4,060,000, but without precise data showing where the increase occurred. The principal towns are Bogota (the capital), with 110,000 inhabitants; Medellin, with 50,000; Panama, 30,000; Cartagena, 20,000; Bucaramanga, 20,000.

No statistics of the movement of population are compiled. An official calculation in 1893 estimated the death-rate at 21 per 1000, 20 per cent. of the deaths being those of children under one year, and 30 per cent. of the total deaths those of children under five years of age. Of the total population 68·8 per cent. are engaged in agriculture; 10·6 per cent. are labourers; 8·6, mechanics; 8·4, commercial; 2·0, miners.

Spanish is spoken throughout Colombia, except among some of the tribes of Indians in the districts adjoining the Meta, Orinoco, and the affluents of these two rivers. The highlands are generally healthy, the lowlands and plains infected to some extent with malarial fever. The annual mean temperature at Bogota, 8300 feet above sea-level, is said to be 63° Fahr.

*Constitution and Government.*—The constitution of 1863 was superseded in 1886 by that now in force, which adopted a centralized organization and named the state the Republic of Colombia. The legislative power is entrusted to the Senate and the House of Representatives, together constituting the Congress, which meets at the capital every two years, on the 20th of July. The Senate consists of twenty-seven members, three from each department, who are elected for six years by the departmental assemblies (local legislatures). The House of Representatives consists of sixty-eight members—one member for every 50,000 inhabitants; they are elected for four years directly by citizens able to read and write, or who have an income of \$500 a year, or real estate worth \$1500. The executive authority is vested in the President of the Republic, who is assisted by ministers chosen by him, and a Council of State consisting of seven members. He is elected by electoral colleges for six years, and when for any reason he ceases to act, the vice-president takes his place.

*Local Government.*—Each of the nine departments is divided into provinces, and these into municipal districts, of which there are 991. The departments are under governors appointed by the President, and each has an elective assembly, meeting every two years. The municipal districts are under alcaldes, and each has an elective municipal council. The governors and alcaldes are agents both of the central and local authorities.

*Justice.*—Justice is administered by a supreme court composed of seven members, the president of the court being elected by the members for a term of four years. In each of the judicial districts there are superior tribunals, lower courts, and magistrates. The law, both civil and criminal, is written and codified. The foundation of the Colombian legal system is Spanish law, modified in certain directions to suit local conditions. Many complaints are made of the administration of justice throughout the republic, and there can be no question that legal procedure is extremely dilatory.

*Religion.*—The religion is the Roman Catholic. The ecclesiastical establishment consists of an archbishop, ten bishops, eight vicars-general, and 2170 priests of all classes, besides monks, who do not belong to the regular priesthood. The number of monks in 1894 in thirteen monasteries was 469, and the number of nuns in ten communities was 731. In 1894 the number of churches was 714, and chapels 312, in the whole republic.

*Education.*—Education, especially in the primary branches, has been much neglected, although attention has from time to time been directed to the subject. Primary education is under the control of the municipal authorities, grants in aid of the schools being given by the central Government. It is free, but not compulsory. The number of primary schools in 1898 was stated to be 2036, and the number of pupils on the rolls about 110,320. For secondary education there are thirty-four public colleges; fifteen normal schools, with 600 pupils; four technical colleges, with 800 students; two academies of music, with 300 pupils; one school of fine arts, with 160 pupils; a Salesian institute, with 200 pupils; and a national night institute for artizans, with 150 pupils. There is a national university, and four departmental universities. The national Government devotes a sum of nearly 800,000 pesos annually to educational purposes. There is a national library containing 40,000 volumes, and a museum of antiquities and natural curiosities, both situated in the capital of the republic. Seminaries for priests are maintained by their own revenues and are free from civil control.

*Defence.*—The peace footing of the army was fixed at 2158 men in the budget for the biennial period 1899–1900. The military strength, however, consists principally of a national militia comprising about 130,000 men, with 3203 officers, who can be called to serve if required. The small arm in use is the Mannlicher rifle. The police force consists of 1000 men.

*Finance.*—The actual revenue recorded in 1895 was 16,273,259 pesos; in 1896, 20,444,489 pesos; in 1897, 19,519,431 pesos; in 1898, 17,941,569 pesos. For the biennium 1897–98 the revenue was 57,461,000, and the expenditure 41,429,180 pesos, leaving a deficit of 3,968,180 pesos. The principal sources of revenue are the duties on imports and exports, these yielding 10,750,889 pesos in 1895, 13,697,823 pesos in 1896, and 13,256,353 pesos in 1897. The falling off in 1897 was stated to be in consequence of the reduction of the duties on salt, and the suppression of the export duty on coffee. Other sources of income in 1897 were—the *saladero* tax, 1,767,607 pesos; the sale of stamped paper, 733,762 pesos; and the post office and telegraphs. The war department absorbs more than one-half of the annual expenditure; but details of actual expenditure are not accessible. The budgets of revenue and expenditure are voted for periods of two years. For 1899–1900 the revenue was estimated at 34,305,000 pesos, and the expenditure at 34,000,000 pesos.

The service of the foreign debt was suspended in 1880. The amount of this obligation was then £1,913,500, bearing interest at the rate of 4½ per cent. per annum. In 1896, when the debt and arrears amounted to £3,514,442, an agreement was made to issue bonds for £2,700,000 in exchange for old bonds, arrangements being made for a reduction in the rates of interest and amortization. Of the authorized issue the sum of £2,500,000 had been emitted in 1899, but the payment of interest by Colombia ceased in 1899. The internal indebtedness consists of a consolidated debt of 6,000,000 pesos; a floating debt of 5,000,000 pesos; and the paper money in circulation, increased by recent issues to 40,000,000 pesos. The total internal obligations are, therefore, 51,000,000 pesos in round numbers.

*Production.*—Economic development has been retarded by the difficulties of transport, and by the frequent recurrence of revolutionary disturbances. The production of wheat and other bread stuffs is insufficient for local demand. The principal industry is coffee planting. The export of coffee in 1895 amounted to 21,504 tons; 1896, 28,521 tons; in 1897, 17,564 tons; in 1898, 38,480 tons. Colombian coffee shipped at the Venezuelan port of Maracaibo does not figure in the return of Colombian exports. Tobacco is exported in large quantities, amounting for 1898 to 6120 tons; cocoa and sugar are also grown—the former in sufficient quantities for export. Ivory nuts and dye-woods are collected for shipment abroad, and various [illegible]. Of india-rubber, 404 tons were exported in 1898. The rubber trees are principally found in the low-lying forest regions bordering the Orinoco river, and southwards towards the affluents of the river Amazon.

Pastoral industry extends over the whole country, but is practised on a large scale only on the great plains of the interior adjoining the rivers flowing into the Orinoco, where the number of cattle is estimated to be not far short of 3,500,000. Dried beef, *tasajo*, is prepared, and animals are driven to populous centres for sale; but the outlet is much restricted. In 1899 the scarcity of cattle in Cuba caused a demand, and a large number of live animals were exported from the port of Cartagena. Sheep, goats, and swine are raised for the home market.

The mining industry has hitherto been chiefly directed towards the search for gold and emeralds, and, to a lesser extent, silver. The production of gold and silver in three years is given as follows, in troy ounces:—

| | 1896. | 1897. | 1898. |
|---|---|---|---|
| | oz. | oz. | oz. |
| Gold . | 106,416 | 107,734 | 109,470 |
| Silver . | 3,407,610 | 5,048,257 | 5,484,725 |

In July 1899 a sudden fever for speculation in emeralds set in and lasted for some weeks. During this period stones to the value of 4,000,000 pesos were stated to have changed hands, often at prices above the values in Europe. Iron ore of good quality is abundant. The salt mines are worked as a Government monopoly, and the supply is large.

Manufacturing industry is only in its infancy. The Pradera ironworks to the north-east of Bogota have a capacity for a daily output of 30 tons of pig-iron, and this establishment also produces wrought iron, rails, sugar-mills, and castings. Manganese is found in the vicinity of these works. Breweries and distilleries have been established in the principal cities. Soap and candle factories, boot- and shoe-making, tanneries, and other small local industries are found scattered over the republic to supply the local needs of the population.

*Commerce.*—The imports consist mainly of tissues, groceries, wines and spirits, hardware, and other articles of common use or consumption, while the principal exports are coffee, gold and silver, tobacco, live-stock, hides and skins, bananas, and some medicinal products. The values of the imports and exports, expressed in sterling (gold peso = 4 sh.), for six years were as follow:—

| Years. | Imports. | Exports. | Years. | Imports. | Exports. |
|---|---|---|---|---|---|
| | £ | £ | | £ | £ |
| 1893 | 2,680,660 | 2,926,060 | 1896 | 3,389,420 | 3,719,470 |
| 1894 | 2,142,240 | 3,192,400 | 1897 | 3,627,400 | 3,364,080 |
| 1895 | 2,305,670 | 3,017,680 | 1898 | 2,216,610 | 3,831,540 |

In 1898 the imports at Panama and Colon amounted to the value of £722,468; and the exports to £212,220. The exports in 1898 from the ports of Panama, Colon, Barranquilla, Cartagena, and Santa Marta comprised coffee to the value of £1,384,184; gold dust, £595,343; silver and silver ore, £182,018; tobacco, £309,609; hides and skins, £175,684; live-stock, £192,507; bananas, £116,720; rubber, £84,822. Of the exports in 1898, the value of £1,061,175 went to the United States, £963,270 to Great Britain, £674,350 to France, £613,980 to Germany, and £200,130 to Venezuela. According to British statistics, the imports into the United Kingdom from Colombia in 1899 amounted to £574,021; and the exports of home produce from the United Kingdom to Colombia, to £668,986 of which £356,693 was for cottons. According to American statistics, the imports into the United States from Colombia in 1899 amounted to £1,067,900, of which £506,320 was for coffee; and the exports of home produce from the United States to Colombia, to £622,830.

The principal commercial centre for the direct trade of Colombia is Barranquilla, slightly more than one-half of the total passing by way of that place through the port of Sabanilla; about one-quarter of the balance goes to Cartagena, and the remainder is chiefly divided between Buenaventura, Riohacha, and Santa Marta. The transit trade by way of Panama to and from Europe and the east and west coasts of North America averages annually about 130,000 tons for the outward freights, and about 120,000 tons for those to Europe and the Atlantic ports. The import and export trade is largely in the hands of British, German, Spanish, Italian, and French merchants.

*Shipping and Communications.*—Thirty-three regular steamers visit Colombian ports monthly; of these, 15 are British, 9 American, 4 German, 3 French, 1 Spanish, and 1 Italian. The number of ships entering Colombian ports in 1897 was 1897, with a total

tonnage of 858,457 tons; the number cleared in the same year was 1850, with a tonnage of 800,710 tons. In 1898, 266 vessels of, altogether, 441,673 tons entered, and 263 of 442,777 tons cleared at Barranquilla and Sabanilla—more than half the tonnage being British. The shipping belonging to Colombian ports had, in 1898, a total tonnage of 2227 tons.

Means of transport for both passengers and freight are confined to a large extent to conveyance by mule or donkey. The so-called roads are little more than bridle tracks. The total length of the railways open to public service in 1899 was only 419 miles; but about 80 additional miles are in course of construction. These railways are in isolated sections, running as a rule from the seaboard to inland towns at different points of the coast. The Panama–Colon line has a length of 48 miles; the Cartagena–Calamar line, 65 miles. The Magdalena river forms an important artery of trade. It is navigable for 780 miles; steamers ascend to La Dorada, 590 miles from Barranquilla; tributaries supply 215 miles more of navigable river, and on these waters 42 steamers, with a total tonnage of 7330 tons, ply regularly. At present the journey from the coast to Bogota requires at least twelve days of continuous travel by rail, steamer, and mule. There are some 8600 miles of telegraph lines, with 448 stations open to the public; and a telephone system has been established in the principal towns. The republic is connected with the outside world by the cable of the Central and South American Cable Company.

The postal service is well organized; in the two years 1896–97 the letters and post-cards conveyed numbered 2,794,069; printed papers, 1,233,313; other packets, 161,217,—total pieces, 4,188,599.

*Panama Canal.*—The construction of a ship canal, 46 miles in length, across the Isthmus of Panama was in 1881 undertaken by a company which went into liquidation in 1889. A new company, formed in 1894, carried on the work, and their concession was extended to the year 1910, by which time it was estimated the canal and locks might be completed, at a cost of £20,480,000. The total sum raised for the purpose of constructing the canal was 772,545,412 francs by the old company, and 65,000,000 francs by the new company. But when the American Government took up the question of constructing an Isthmian Canal, the position of the Panama Company was necessarily involved. See the articles CANALS and LESSEPS.

*Credit and Currency.*—The law, passed in 1894, for the redemption of the inconvertible paper currency has not been carried into effect. The amount in circulation is stated to be 51,000,000 pesos, the value constantly fluctuating, to the injury of trade. In Panama the silver dollar of 25 grammes, ·835 fine, is the coinage in common use, but Peruvian silver is also current. The principal banking institutions are the Banco Nacional, the Banco de Colombia, and the Banco de Bogota, besides a number of private banks. The Banco Nacional is exclusively a State bank, and through it the paper money is put in circulation. The metric system of weights and measures is the legal system, but is not customarily in use, except at the Custom House and other Government offices. For ordinary purposes the Spanish pound, of 1·102 lb avoirdupois; the *arroba*, of 25 lb; and the *carga*, of 250 lb, are invariably employed. Corn is measured by the *fanega*. In lineal measurement the *vara* (80 centimetres) is used. The litre is the standard for liquid measure.

*Recent History.*—The term of office for which President Aquiles Parra had been elected in 1876 came to a conclusion in 1878, and in April of that year General Trujillo was inaugurated as President of the republic for the two succeeding years. His administration was marked by a strong effort to place the financial position of the Government on a more satisfactory footing, and the internal indebtedness was substantially reduced during his rule. In April 1880 Señor Rafael Nuñez acceded to the Presidency. During his term of office revolutionary disturbances occurred in the provinces of Cauca and Antioquia, but were suppressed with no great difficulty. Provision was made in 1880 for a settlement of the boundary dispute with Costa Rica, and in July of that year the federal Congress authorized the formation of a naval squadron. A movement was now set afoot in favour of a confederation of the three republics of Colombia, Ecuador, and Venezuela on the basis of the original conditions existing after the expulsion of Spanish authority, and a resolution was passed by the Chamber of Deputies to that effect. The opposition shown by Venezuela and Ecuador to this project prevented any definite result from being achieved. In April 1882 Señor Laldua became President, but, his death occurring a year later, General Otalora was nominated to exercise the executive power for the unexpired portion of the term. In 1883 the dispute in connexion with the boundary between Colombia and Venezuela was submitted by the two Governments to the arbitration of Alphonso XII., king of Spain, and a commission of five members was appointed to investigate the merits of the respective claims. The decision in this dispute was finally given by the Queen Regent of Spain on 16th March 1891. In April 1884 Señor Rafael Nuñez was again proclaimed President of the republic in his absence abroad. Pending his return the administration was left in the hands of General Campo Serrano and General Eliseo Payan. The Liberal party had been instrumental in the re-election of Nuñez, and looked for a policy in conformity with their views and political convictions. President Nuñez had no sooner returned to Colombia than the Liberals discovered that his political opinions had changed and had become strongly Conservative. Discontent at this condition of affairs soon spread. Nuñez from motives of ill-health did not openly assume the Presidential office, but from his house near Cartagena he practically directed the government of the republic. The Liberals now began to foment a series of revolutionary movements, and these led in 1885 to a civil war extending over the departments of Boyaca, Cundinamarca, Magdalena, and Panama. General Reyes and General Velez were the two principal leaders of the revolt. In order to protect the passage of the traffic across the Isthmus of Panama during these disturbed times detachments of United States marines were landed at Panama and Colon, in accordance with the terms of the concession under which the railway had been constructed. After a number of defeats the leaders of the revolt surrendered in August 1885, and on 5th September following peace was officially proclaimed. Nuñez, who had meanwhile assumed the Presidential duties, now brought about a movement in favour of a fresh Act of Constitution for Colombia, and a new law to that effect was finally approved and promulgated on 4th August 1886. Under the terms of this act the federal system of government for Colombia was abolished, the states becoming departments, the governors of these political divisions being appointed by the President of the republic. Each department has a local legislative assembly elected by the people. The National Congress is constituted of the Senate and the House of Representatives. The Senate is composed of twenty-seven members elected for six years, one-third retiring every two years, three of whom are nominated by each of the nine departments. The House of Representatives comprises members elected for four years by universal suffrage, each department forming a constituency and returning one member for every 50,000 inhabitants. The Congress convenes every two years. The Presidential term of office under the new Act was fixed at six years in place of the two years formerly prevailing. The judiciary was irremovable, and trial by jury was allowed for criminal offences. Capital punishment was re-established, and the press was made responsible for matter published. The unlicensed trade in arms and ammunition thitherto existing was prohibited. Previous to 1886 the crime of murder was only punishable by 10 years' imprisonment, a sentence which in practice was reduced to two-thirds of that term; slander and libel were formerly offences which the law had no power to restrain, and no responsibility attached to seditious publications.

After the promulgation of this new Act of Constitution President Nuñez was proclaimed as President of the republic for the term ending in 1892. He was unable, however, in consequence of ill-health, to reside at Bogota and discharge the presidential duties, and, consequently, in August 1888 Señor Cárlos Holguin was designated to act for him.

In 1892 President Nuñez was again elected to the Presidency for a term of six years, his continued ill-health, however, forcing him to place the active performance of his duties in the hands of the Vice-President, Señor Miguel Caro. In 1895 the Liberals made another attempt to seize the Government of the country, but the movement was suppressed without any very great difficulty. In this same year Nuñez died, and Vice-President Caro became the actual President, an office he had practically filled during the three previous years. In 1898 Señor M. A. Sanclemente, a strong Conservative, and supported by the Church party, was elected to the Presidency for the period ending in 1904. In October 1899 the Liberals organized another revolutionary outbreak for the purpose of trying to wrest the power from Conservatives, but this attempt had no better success than the movements of 1885 and 1895. In January 1900, however, Vice-President Marroquin seized upon the Government, imprisoned President Sanclemente (who died in prison in March 1902), and another period of disturbance began. The rebels were defeated in May in a desperate battle at Cartagena; and continuous fighting went on about Panama, where British marines had to be landed to protect foreign interests. As the year 1900 advanced, the conflict went on with varying success, but the Government troops were generally victorious, and in August Vice-President Marroquin was recognized as the acting head of the executive, with a Cabinet under General Calderon. In 1901 the rebellion continued, and severe fighting took place about Colon. Further complications arose in August, when trouble occurred between Colombia and Venezuela. On the one hand, there were grounds for believing that the Clericals and Conservatives in both countries were acting together; and, on the other, it was expected that President Castro of Venezuela would not be sorry to unite his own countrymen, and to divert their attention from internal affairs, by a war against Colombia. The Colombian revolutionary leaders had made use of the Venezuelan frontier as a base of operations, and the result was an invasion of Venezuelan territory by Colombian Government troops, an incident which at once caused a diplomatic quarrel. The United States Government in September offered its good offices, but President Castro refused them, and the state of affairs became gradually more menacing. Meanwhile both Panama and Colon were seriously threatened by the rebel forces, who in November succeeded in capturing Colon by surprise. The situation was complicated by the fact that the railway traffic on the Isthmus was in danger of interruption, and on the capture of Colon it became necessary for the American, British, and French naval authorities to land men for the protection of the railway and of foreign interests.

The chief foreign treaties entered into by Colombia in the last quarter of the 19th century were:—(1) A treaty with Great Britain, signed on 27th October 1888, for the extradition of criminals; (2) a treaty of friendship, commerce, and navigation with Italy, signed 27th October 1892; (3) two protocols with Italy, signed respectively 24th May and 25th August 1886, in connexion with the affair of the Italian subject Cerruti; (4) a consular convention with Holland, signed 20th July 1881; (5) a treaty of peace and friendship with Spain, signed 30th January 1881; (6) a convention with Spain for the reciprocal protection of intellectual property; (7) a concordat with the Vatican, signed 31st December 1887; (8) an agreement with the Vatican, signed 20th August 1892, in connexion with ecclesiastical jurisdiction; (9) an agreement with the republic of San Salvador, signed 24th December 1880, in regard to the despatch of a delegate to an international congress; (10) a treaty of peace, friendship, and commerce with Germany, signed 23rd July 1892; (11) a treaty with the republic of Costa Rica, signed in 1880, for the delimitation of the boundary; (12) the postal convention, signed at Washington, 4th July 1891; (13) a convention with Great Britain, signed 31st July 1896, in connexion with the claim of Messrs Punchard, M'Taggart, Lowther, & Co.; (14) a treaty of friendship, commerce, and navigation with Peru, signed 6th August 1898; (15) an extradition treaty with Peru, signed 6th August 1898; (16) a treaty of peace, [illegible] d defensive alliance with Venezuela, signed 21st N[illegible], and on the same date a treaty regulating the frontier commerce.

**Colombo,** the capital and principal seaport of Ceylon, in the west coast. It has greatly changed since 1875. The formation of a commodious harbour (though the works are still in progress), and of 300 miles of railway, has made the port a very important one, mail steamers calling regularly, as well as men-of-war and mercantile marine of all nations, while the island's export traffic is concentrated in it. The demolition of the landward side of the old Dutch fort enabled new roads and buildings to be constructed; much land was reclaimed; and the banks, many commercial and steamer offices now occupy fine buildings. A new suburb has been built over with handsome bungalows beyond the Public Museum (a very fine structure) and Victoria Park. The water supply is drawn from a hill region 30 miles off. A scientific scheme of drainage is contemplated. Most of the town is lighted by gas, and certain quarters with electric light, and electric tramways have been laid over 7 miles of city roads. The packing, blending, and shipping of tea (rather than of coffee) is now the great industry, along with the preparation and packing of cocoanut oil, cocoa (chocolate) plumbago, spices, &c. 607 steamers called to coal in 1900. Population (1891), 128,870; (1901), 154,279. There is a floating population in the harbour of from 5000 to 15,000.

**Colon,** formerly known as Aspinwall, a city and port on the northern coast of Panama, in the republic of Colombia, South America, on the north-east side of the Bay of Limon, 41 miles north-west of Panama by rail. Having been burned down during the revolution of 1885, it was rebuilt on improved plans, but owing mainly to carelessness in the administration and the untidy habits of the inhabitants, chiefly West Indians from Jamaica, it is still rather unhealthy. The streets, though wide and originally well paved, are badly kept, but are lighted by electricity. The harbour is only an open bay, and therefore dangerous at certain seasons. There are four piers, affording accommodation for eight ocean steamers at one time, in addition to a number of sailing craft. The northern portion of the city, owned by the Panama Railway Company, is supplied with water from the Chagres river, but the remainder depends mainly on rain water. There are a number of important commercial houses, an aërated water factory, and a distillery. The average tonnage of vessels entering is over 500,000 annually. Colon possesses a bronze statue

of Columbus, presented by the Empress Eugénie in 1870. The population is about 10,000.

**Colon,** an important railway town of Matanzas province, Cuba, and the centre of a rich sugar-planting country. Population (1899), 7175.

**Colonne, Édouard** (properly JUDAS) (1838–——), French conductor, was born at Bordeaux on 23rd July 1838. He entered the Paris Conservatoire in 1856, and obtained there the first prizes in harmony and violin-playing in 1858 and 1863. He became a member of the orchestra at the Grand Opera in 1858, and at the foundation of Pasdeloup's Concerts Populaires was one of the first violins. The success of these concerts induced Colonne to start some on his own account. With the aid of Messrs Duquesnel and Hartmann, he founded Le Concert National. The first concert took place at the Odéon Theatre on 2nd March 1873. The following year the Concert National changed its title to that of Association Artistique, and migrated to the Théâtre du Châtelet. M. Colonne has done a great deal to popularize the works of Hector Berlioz, besides bringing forward compositions of the younger French school of music. He was "chef d'orchestre" at the Paris Grand Opera from 1891 to 1893, and conducted the first performance there of Wagner's *Die Walküre.* M. Colonne has travelled with his orchestra, and he visited London in the autumn of 1896, when he gave four concerts at the Queen's Hall.

**Colorado,** a western State of the American Union, situated between 41° and 37° N. lat. and 102° and 109° W. long., bounded on the N. by Wyoming and Nebraska, on the E. by Nebraska and Kansas, on the S. by Oklahoma and New Mexico, and on the W. by Utah. Its largest and most important development has occurred since 1875. During this period the growth of its mining, railway, manufacturing, and agricultural interests has been much greater than during all its previous history, while its educational institutions have nearly all of them been established since it was admitted to the Union, and its population has increased several-fold. Many of its towns have sprung into existence during this time, and its larger towns have changed from straggling and poorly constructed villages into important residential and manufacturing cities. Its area is 103,925 square miles, or over 66,000,000 acres. The western half of the State was part of the Mexican Cession of 1848. The south-east corner was part of the Texas Cession of 1850, and the north-western part of the Louisiana Purchase of 1803. It was organized as a Territory in 1861, and admitted as a State on 1st August 1876. At the first State election 30,000 votes were polled, the entire Republican ticket being elected, with John L. Routt (Republican) as Governor. The second Governor was F. W. Pitkin, who held office for four years, and was elected on the Republican ticket. He was followed by James B. Grant, a Democrat, who was succeeded by B. H. Eaton, a Republican. Alva Adams, a Democrat, was elected in 1887, and J. R. Cooper, a Republican, in 1890, being followed by John L. Routt. David H. Waite, a Populist, was chosen in 1893, Albert W. M'Intire, a Republican, in 1895; Alva Adams was again chosen in 1897, on a fusion ticket of Democrats and Populists, and on the same ticket Chas. S. Thomas was elected in 1899, and James B. Orman in 1901. The question of the free coinage of silver played an important part in the last three elections. Woman's suffrage prevails, having been adopted in the election of 1893 by a majority of about 5000 votes.

*Population.*—In 1876 the population was estimated at 135,000; the census of 1880 showed an increase to 194,327, that of 1890 to 412,198, and that of 1900 to 539,700. The average number of persons to the square mile was 5·2 in 1900, as compared with 3·9 in 1890. The population in 1900 was made up as follows:—295,332 (54·7 per cent.) males and 244,368 (45·3 per cent.) females, 448,545 native-born and 91,155 foreign-born, 529,046 white and 10,654 coloured (including 8570 negroes, 599 Chinese, 48 Japanese, and 1437 Indians). Out of 185,708 males 21 years of age and over, 7689 were illiterate (unable to write), including 3804 foreign-born, 448 negroes, 138 Chinese, 10 Japanese, and 246 Indians. The death-rate of the entire state in 1900, on the basis of the deaths reported to the U.S. census enumerators, was about 13·7. In 1900 there were 165 incorporated cities, towns, and villages in Colorado, of which 27 had a population of more than 2000, and of these 7 had a population of over 5000, namely, Denver, with 133,859; Pueblo, with 28,157; Colorado Springs, with 21,085; Leadville, with 12,455; Cripple Creek, with 10,147; Boulder, with 6150; and Trinidad, with 5345 inhabitants. The growth of Denver has been as follows: (1870), 4759; (1880), 35,629; (1890), 106,713; (1900), 133,859.

*Mineral Resources.*—The pioneers in the settlement of the State were attracted by its mineral resources. Gold and silver are found in 57 counties; iron, copper, lead, and zinc in 37; and aluminium in 5. The first discovery of gold was made on January 7, 1859; since then the coin value of the gold and silver produced, including the output of 1899, has been $665,039,636. The coin value of the gold product for 1899 was $26,265,487, and that of silver $29,679,706, making a total of $55,945,193. The total product for 1898 was $53,484,649. The chief gold-producing counties are Gilpin, Boulder, San Miguel, El Paso, Teller, Clear Creek, and Lake. The Cripple Creek district produced in 1900 about $1,250,000 of gold per month, and since 1891 had yielded $43,450,000. The largest silver production was in 1892, when the coin value of the product was $31,478,972. Iron ores are found in great abundance, and all materials necessary for making steel of excellent quality. The total value of the steel and iron products for 1899 was $7,681,719, in which year 134,936,223 pounds of steel rails and 215,640,332 pounds of pig iron were manufactured. Colorado stood ninth in 1898 in the list of coal-producing States. The aggregate area of coal beds is estimated at 18,100 square miles, and the accessible coal at 33,897,800,000 tons. In 1899 the total tonnage mined was 4,806,879, and 455,783 tons of coke were produced, the number of men employed being 7321. There are 35 oil wells in Fremont county, which are sunk to a depth of about 1500 feet. The oil ordinarily rises to within 400 feet of the surface, although there have been a number of flowing wells. The product increased from 76,295 barrels in 1887 to 842,000 in 1892; in 1900 it was about 500,000. It is refined, for the most part, at Florence, where there are two modern refineries. The value of lead produced in 1898 was $4,394,917; of copper, $1,831,500. The number of men employed in mining of all kinds was 30,231. Building stone of many varieties and of excellent quality is produced, valued at $2,000,000 annually. Mineral springs are found in all parts of the State. They vary in temperature from 40° to 150° F., and many possess medicinal value. The chief springs are at Manitou, Glenwood, Idaho Springs, Poncho Springs, Buena Vista, and Cañon City.

*Agriculture and Stock-Raising.*—Early experiments in farming indicated that regular crops could be secured only by means of irrigation, and in 1872 irrigation ditches were exempted from taxation. Extensive systems of canals were developed. In 1877 English capitalists constructed a canal over 150 miles in length. This was followed by a canal that cost $2,500,000. Since then extensive canals have been built in the Arkansas and Grand Valleys, the San Luis Park, and other parts of the State. In 1889 there were over 6000 miles of main irrigating ditches. In 1900 the mileage had increased to more than 15,000, and the valuation of all irrigation enterprises was $6,000,000. The amount of land under irrigation in 1883 was 416,594 acres, and in 1899, 1,975,400 acres. The average annual cost of water per acre is 79 cents. The soil is fertile in the north central section and in the river bottoms and large valleys, producing cereals, fruits, and vegetables of a superior quality. As early as 1866 the Surveyor-General estimated that of the population of 35,000 one-half were engaged in agriculture. In 1870 the agricultural production was estimated at $3,500,000, or within half a million of the bullion product. The total value of all farm, range, ranch, and orchard products in 1882 was $8,947,500, and in 1899, $45,774,251. The assessed valuation of all agricultural lands in 1900 was $19,566,124, and of grazing lands $9,901,701. The natural fruits are rare and almost worthless. In 1873 fruit trees began to be planted in various parts, and in 1882 the amount of land in orchards was 2500 acres, and the estimated value of the fruit crop $250,000; in 1898 the number of acres of fruit land was 118,752, and the value of the fruit crop $5,225,000; and there was still much open for settlement and improvement. Apples, peaches, plums, apricots, pears, cherries, and melons of exceptionally fine flavour are raised in increasingly large quantities. The most productive sections are along the Arkansas Valley, and in the western and south-western portions of

the State. Melons from Rocky Ford and peaches from Mesa county are shipped to the east, and in small quantities to Europe. The report for 1898 shows that the staple grains gave the following yield in bushels: wheat, 6,729,565, corn, 3,113,892; barley, 353,952; oats, 3,063,191; rye, 47,484. The hay product was 1,760,728 tons, and potatoes 2,564,331 bushels. The total value of these products was estimated at $17,349,251, as against $3,047,750 in 1882. It has been discovered by experiments conducted by the United States Government, through the Agricultural College, that the soil along the South Platte, the Arkansas and Grand rivers, and also in the San Luis Valley, is adapted for the cultivation of sugar beets, the average crop being 16 tons to the acre, and the proportion of saccharine matter unusually large. Sugar factories have been built at Grand Junction, Rocky Ford, and Sugar City; the first with a daily capacity of 3500 tons, and the others of 7500 tons. Stock-raising has always played an important part in the development of the State. The native grasses are especially adapted for fodder. The grama, buffalo, and bunch varieties cure on the stem and furnish nutritive food throughout the year. Before the plains were fenced, large herds drifted to the south during the winter; but sufficient hay and alfalfa are now cut to feed the cattle during the storms, which at longest are brief. As the industry has grown, laws have been enacted concerning branding, herding, and protection from disease; and a State Board of Inspectors has been formed. In 1884 the number of cattle was given as 1,005,000, and the number of sheep as 1,497,000. In 1899 the number was as follows: cattle, 754,039; sheep, 930,839; horses, 194,923; and mules, 7480. The total assessed valuation was $11,627,730, the assessment being about one-third of the market value. Wool in 1898 averaged seven pounds per fleece, the total clip yielding $840,000. The total value of cattle slaughtered in the packing houses in 1898 was $3,168,000. The value of the dairy product in the same year was $13,267,849.

*Manufactures.*—Since 1888 there has been a considerable growth of manufacturing. There are 18 smelters and reduction plants in the State, situated mainly at Denver, Leadville, Durango, and at Pueblo, where there are also blast-furnaces, a steel plant, and rolling mills. The most improved methods of treating ore are used. The cyanide process, introduced in 1890, is now one of the most important factors in the treatment of low-grade and refractory gold and silver ores. The improved dioxide cyanide process was adopted in 1895. One million barrels of flour were produced during 1899, the fifty mills having a capacity of 2,000,000 per annum. Cotton and paper manufactures are carried on in the vicinity of Denver. According to the United States' Census of 1900, there were in the State 1792 manufacturing establishments (excluding 1778 classified as hand trades, and 292 others, with a product of less than $500 each). They had a total capital of $59,515,279, an average number of 19,948 wage-earners, and products valued at $91,639,495. This sum includes the value of the gold, silver, lead, and copper smelted, which amounted to $44,625,305. Of the other products, iron and steel (valued at $6,108, 295), flouring and grist mill products (valued at $4,528,062), and foundry and machine shop products (valued at $3,986, 915), were the most important.

*Railways.*—The Denver Pacific, built from Cheyenne, reached Denver in June 1870, and the Kansas Pacific in August of the same year. Then followed the Denver and Rio Grande, to which the earlier development of the State is largely due. In 1886 the Colorado Midland started from Colorado Springs westwards, up the Ute Pass, and through the South Park to Leadville, and then over the Continental Divide to Aspen and Glenwood Springs; it has right of way over the Denver and Rio Grande line to Grand Junction, there connecting with the Rio Grande Western for Salt Lake City and Ogden, and the Pacific Coast. The Colorado and Southern, connecting Colorado with the south, has become an important system. In 1900 there were fifteen railways, with 4685 miles, in operation. The assessment on railways, tramways, telephones, and telegraphs was $35,533,586.

*Finances.*—The assessed valuation in real and personal property in 1876 was $44,130,205; in 1899 the total assessed valuation of all properties was $203,861,746; but this was regarded by the State Board as too low, and 5 per cent. increase was recommended. Taxes were levied in 1899 to the amount of $4,688,458. The total State debt in 1899 was $2,584,443. The cash in the treasury and uncollected taxes, $849,275, leaving a balance of indebtedness of $1,735,167. The total deposits in the 36 national banks on 13th February 1900, was $45,802,863.

*Education.*—Of the public lands, 3,715,555 acres were granted for the support of schools, 46,080 acres for the University, and 90,000 acres for the Agricultural College. In 1900 the number of persons of school age (5 to 20 years inclusive) was 160,531. The amount apportioned to the various school districts for 1900 was $62,577, and the total value of all school properties was $6,495,850. The salaries paid to the teachers in the public schools during 1899 and 1900 amounted to $1,423,680. Graded schools are found throughout the State, and high schools in all the larger towns. The State institutions are: the University of Colorado, at Boulder; the School of Mines, at Golden; the Agricultural College, at Fort Collins; the Normal School, at Greeley; the School for the Deaf and Blind, at Colorado Springs; the Industrial School for boys, at Golden, and for girls at Aurora. These are supported by a mill tax, and special appropriations. The State University has an annual income of $70,000, and a library of 19,000 volumes; the School of Mines, an income of $37,000; and the Normal School an income of $32,000, and a library of 10,000 volumes. The Agricultural College has an income of $65,500, of which $23,000 is from the United States Government. Experiment stations are conducted in connexion with the college at Fort Collins, Rocky Ford, and Cheyenne Wells. There are two institutions for higher education on an independent foundation. Colorado College, at Colorado Springs, is the oldest existing college in the State. Its property in equipment and endowment is $1,500,000, and it has a library of 30,000 volumes. The University of Denver, under Methodist control, is an outgrowth of the Colorado Seminary, the charter of which was granted in 1864. It has associated Law and Medical Schools. The Chamberlin Astronomical Observatory, with a 20-inch aperture telescope, is part of its equipment.

(W. F. S.)

**Colorado Springs,** capital of El Paso county, Colorado, U.S.A. It is situated near the centre of the state upon the high plains near the base of the Rocky Mountains, on Fontaine qui Bouille river, at the mouth of Monument creek, in 38° 50′ N. lat. and 104° 49′ W. long., at an altitude of 5985 feet. Its situation is fine, commanding a superb view of the mountains, whose culminating point, Pike's Peak, rises to a height of 14,108 feet, or more than 8000 feet above the city. It is entered by five railways: the Denver and Rio Grande; the Atchison, Topeka, and Santa Fé; the Colorado and Southern; the Chicago, Rock Island, and Pacific; and the Colorado Midland. It is the site of Colorado College, which in 1899 had a faculty numbering thirty-three, and was attended by 335 students. Colorado Springs was founded in 1871, upon the construction of the Denver and Rio Grande Railway, and has had a rapid growth. In its earlier years this was due to the beauty of its situation and its reputation as a health resort for consumptives. In later years the development of the gold mines at Cripple Creek has given it importance as a supply-point for this great mining camp. Population (1880), 4226; (1890), 11,140; (1900), 21,085, of whom 2300 were foreign-born and 875 negroes.

**Colossæ,** once the great city of South-West Phrygia, was situated at an altitude of 1150 feet on rising ground on the left bank of the Lycus (*Churuk Su*), a tributary of the Mæander, at the upper end of a narrow gorge 2½ miles long, through which the river runs between cliffs from 50 to 60 feet high. It stood on the great trade route from Sardis to Celænæ and Iconium, and was a large, prosperous, and populous city (Herod. vii. 30; Xenophon, *Anab.* i. 2, § 6), until its prosperity was ruined by the foundation of Laodicea in a more advantageous position. The town was celebrated for its wool, which was dyed a purple colour called *colossinus*. Colossæ was the seat of an early Christian Church, possibly founded by Epaphras, to which St Paul addressed an epistle. For some centuries it continued to prosper, but during the 7th and 8th centuries it was gradually deserted under pressure of the Arab invasions. Its place was taken by Khonæ (*Khonas*)—a strong fortress on a rugged spur of Mt. Kadmus, 3 miles to the south, which became a place of importance during the wars between the Byzantines and Turks, and was the birthplace of the historian, Nicetas Khoniates. The worship of angels alluded to by St Paul (Col. ii. 18), and condemned in the 4th century by a council at Laodicea, reappears in the later worship of St Michael, in whose honour a celebrated church, destroyed by the Seljúks in the 12th century, was built on the right bank of the Lycus (Ramsay, *Cities and Bishoprics of Phrygia*, vol. i. 1895).

# COLOURS OF ANIMALS.

## 1. Bionomics.

THE scope of this article includes the uses of colour in the struggle for existence among animals and in their sexual relationships, but not the physiological uses of coloured pigments or the discussion of pigments of uncertain meaning.

*Use of Colour for Concealment.—Cryptic Colouring* is by far the commonest use of colour in the struggle for existence. It is employed for the purpose of attack (*Aggressive Resemblance* or *Anticryptic Colouring*) as well as of defence (*Protective Resemblance* or *Procryptic Colouring*). The fact that the same method, concealment, may be used both for attack and defence has been well explained by Belt (*The Naturalist in Nicaragua*, London, 1888), who suggests as an illustration the rapidity of movement which is also made use of by both pursuer and pursued, which is similarly raised to a maximum in both by the gradual dying out of the slowest through a series of generations. Cryptic colouring is commonly associated with other aids in the struggle for life. Thus well-concealed mammals and birds, when discovered, will generally endeavour to escape by speed, and will often attempt to defend themselves actively. On the other hand, small animals which have no means of active defence, such as large numbers of insects, frequently depend upon concealment alone. Protective Resemblance is far commoner among animals than Aggressive Resemblance, in correspondence with the fact that predaceous forms are as a rule much larger and much less numerous than their prey. In the case of insectivorous Vertebrata and their prey such differences exist in an exaggerated form. Cryptic colouring, whether used for defence or attack, may be either *General* or *Special.* In *General Resemblance* the animal, in consequence of its colouring, produces the same effect as its environment, but the conditions do not require any special adaptation of shape and outline. General Resemblance is especially common among the animals inhabiting some uniformly coloured expanse of the earth's surface, such as an ocean or a desert. In the former, animals of all shapes are frequently protected by their transparent blue colour; on the latter, equally diverse forms are defended by their sandy appearance. The effect of a uniform appearance may be produced by a combination of tints in startling contrast. Thus the black and white stripes of the zebra blend together at a little distance, and "their proportion is such as exactly to match the pale tint which arid ground possesses when seen by moonlight" (Galton, *South Africa*, London, 1889). *Special Resemblance* is far commoner than General, and is the form which is usually met with on the diversified surface of the earth, on the shores, and in shallow water, as well as on the floating masses of Algæ on the surface of the ocean, such as the Sargasso Sea. In these environments the cryptic colouring of animals is usually aided by special modifications of shape, and by the instinct which leads them to assume particular attitudes. Complete stillness and the assumption of a certain attitude play an essential part in General Resemblance on land; but in Special Resemblance the attitude is often highly specialized, and perhaps more important than any other element in the complex method by which concealment is effected. In Special Resemblance the combination of colouring, shape, and attitude is such as to produce a more or less exact resemblance to some one of the objects in the environment, such as a leaf or twig, a patch of lichen, or flake of bark. In all cases the resemblance is to some object which is of no interest to the enemy or prey respectively. The animal is not hidden from view by becoming indistinguishable from its background, as in the cases of General Resemblance, but it is mistaken for some well-known object.

In seeking the interpretation of these most interesting and elaborate adaptations, attempts have been made along two lines. First, it is sought to explain the effect as a result of the direct influence of the environment upon the individual (Buffon), or by the inherited effects of effort and the use and disuse of parts (Lamarck). Second, natural selection is believed to have produced the result, and afterwards maintained it by the survival of the best concealed in each generation. The former suggestions break down when the complex nature of numerous Special Resemblances is appreciated. Thus the arrangement of colours of many kinds into an appropriate pattern requires the co-operation of a suitable shape and the rigidly exact adoption of a certain elaborate attitude. The latter is instinctive, and thus depends on the central nervous system. The cryptic effect is due to the exact co-operation of all these factors; and in the present state of science the only possible hope of an interpretation lies in the theory of natural selection, which can accumulate any and every variation which tends towards survival. A few of the chief types of methods by which concealment is effected may be briefly described. The colours of large numbers of Vertebrate animals are darkest on the back, and become gradually lighter on the sides, passing into white on the belly. Abbot H. Thayer (*The Auk*, vol. xiii., 1896) has suggested that this gradation obliterates the appearance of solidity, which is due to shadow. The colour-harmony, which is also essential to concealment, is produced because the back is of the same tint as the environment (*e.g.*, earth) bathed in the cold blue-white of the sky, while the belly, being cold blue-white bathed in shadow and yellow earth reflexions, produces the same effect. Thayer has made models (in the Natural History Museums at London, Oxford, and Cambridge) which support his interpretation in a very convincing manner. This method of neutralizing shadow for the purpose of concealment by increased lightness of tint was first suggested by E. B. Poulton in the case of a larva (*Trans. Ent. Soc. Lond.*, 1887, p. 294) and a pupa (*Trans. Ent. Soc. Lond.*, 1888, pp. 596, 597), but he did not appreciate the great importance of the principle. In an analogous method an animal in front of a background of dark shadow may have part of its body obliterated by the existence of a dark tint, the remainder resembling, *e.g.*, a part of a leaf (Müller, *Zool. Jahr. J. W. Spengel*, Jena, 1886). This method of rendering invisible any part which would interfere with the resemblance is well known in Mimicry. A common aid to concealment is the adoption by different individuals of two or more different appearances, each of which resembles some special object to which an enemy is indifferent. Thus the leaf-like butterflies (*Kallima*) present various types of colour and pattern on the under side of the wings, each of which closely resembles some well-known appearance presented by a dead leaf; and the common British Yellow Underwing Moth (*Tryphæna pronuba*) is similarly polymorphic on the upper side of its upper wings, which are exposed as it suddenly drops among dead leaves. Caterpillars and pupæ are also commonly *Dimorphic*, green and brown. Such differences as these extend the area which an enemy is compelled to search in order to make a living. In many cases the cryptic colouring changes appropriately during the course of an individual life, either seasonally, as in the ptarmigan or Alpine hare, or, according as the

individual enters a new environment in the course of its growth (such as larva, pupa, imago, &c.). In insects with more than one brood in the year, *Seasonal Dimorphism* is often seen, and the differences are sometimes appropriate to the altered condition of the environment as the seasons change. The causes of change in these and Arctic animals are insufficiently worked out: in both sets there are observations or experiments which indicate changes from within the organism, merely following the seasons and not caused by them, and other observations or experiments which prove that certain species are susceptible to the changing external influences. In certain species concealment is effected by the use of adventitious objects, which are employed as a covering. Examples of this *Allocryptic* defence are found in the tubes of the caddis worms (*Phryganea*), or the objects made use of by crabs of the genera *Hyas*, *Stenorhynchus*, &c. Such animals are concealed in any environment. If sedentary, like the former example, they are covered up with local materials; if wandering, like the latter, they have the instinct to reclothe. Allocryptic methods may also be used for aggressive purposes, as the ant-lion larva, almost buried in sand, or the large frog *Ceratophrys*, which covers its back with earth when waiting for its prey. Another form of Allocryptic defence is found in the use of the colour of the food in the digestive organs showing through the transparent body, and in certain cases the adventitious colour may be dissolved in the blood or secreted in superficial cells of the body: thus certain insects make use of the chlorophyll of their food (Poulton, *Proc. Roy. Soc.* vol. liv. p. 417). The most perfect Cryptic powers are possessed by those animals in which the individuals can change their colours into any tint which would be appropriate to a normal environment. This power is widely prevalent in Fish, and also occurs in Amphibia and Reptilia (the chameleon affording a well-known example). Analogous powers exist in certain Crustacea and Cephalopoda. All these rapid changes of colour are due to changes in shape or position of superficial pigment cells controlled by the nervous system. That the latter is itself stimulated by light through the medium of the eye and optic nerve has been proved in many cases. Animals with a short life-history passed in a single environment, which, however, may be very different in the case of different individuals, may have a different form of *Variable Cryptic Colouring*, namely, the power of adapting their colour once for all (many pupæ), or once or twice (many larvæ). In these cases the effect appears to be produced through the nervous system, although the stimulus of light probably acts on the skin and not through the eyes. Particoloured surfaces do not produce particoloured pupæ, probably because the antagonistic stimuli neutralize each other in the central nervous system which then disposes the superficial colours so that a neutral or intermediate effect is produced over the whole surface (Poulton, *Trans. Ent. Soc. Lond.*, 1892, p. 293). Cryptic colouring may incidentally produce superficial resemblances between animals; thus desert forms concealed in the same way may gain a likeness to each other, and in the same way Special Resemblances, *e.g.*, to lichen, bark, grasses, pine-needles, &c., may sometimes lead to a tolerably close similarity between the animals which are thus concealed. Such likeness may be called *Syncryptic* or *Common Protective* (or *Aggressive*) *Resemblance*, and it is to be distinguished from Mimicry and Common Warning Colours, in which the likeness is not incidental but an end in itself. Syncryptic Resemblances have much in common with those incidentally caused by functional adaptation, such as the mole-like forms produced in the burrowing Insectivora, Rodentia, and Marsupialia. Such likeness may be called *Syntechnic Resemblance*, incidentally produced by dynamic similarity, just as Syncryptic Resemblance is produced by static similarity.

*Use of Colour for Warning and Signalling.*—The use of colour for the purpose of warning is the exact opposite of the one which has been just described, its object being to render the animal conspicuous to its enemies, so that it can be easily seen, well remembered, and avoided in future. Warning colours are associated with some quality or weapon which renders the possessor unpleasant or dangerous, such as unpalatability, an evil odour, a sting, the poison-fang, &c. The object being to warn an enemy off, these colours are also called *Aposematic*. Recognition markings, on the other hand, are *Episematic*, assisting the individuals of the same species to keep together when their safety depends upon numbers, or easily to follow each other to a place of safety, the young and inexperienced benefiting by the example of the older. Episematic characters are far less common than Aposematic, and these than Cryptic; although, as regards the latter comparison, the opposite impression is generally produced from the very fact that concealment is so successfully attained. *Warning* or *Aposematic Colours*, together with the qualities they indicate, depend, as a rule, for their very existence upon the abundance of palatable food supplied by the animals with Cryptic colouring. Unpalatability, or even the possession of a sting, is not sufficient defence unless there is enough food of another kind to be obtained at the same time and place (Poulton, *Proc. Zool. Soc.*, 1887, p. 191). Hence insects with Warning Colours are not seen in temperate countries except at the time when insect life as a whole is most abundant; and in warmer countries, with well-marked wet and dry seasons, it will probably be found that Warning Colours are proportionately less developed in the latter. In many species of African butterflies belonging to the genus *Junonia* (including *Precis*) the wet-season broods are distinguished by the more or less conspicuous under sides of the wings, those of the dry season being highly cryptic. Warning Colours are, like Cryptic, assisted by special adaptations of the body-form, and especially by movements which assist to render the colour as conspicuous as possible. On this account animals with Warning Colours generally move or fly slowly, and it is the rule in butterflies that the Warning patterns are similar on both upper and under sides of the wings. Many animals, when attacked or disturbed, "sham death" (as it is commonly but wrongly described), falling motionless to the ground. In the case of well-concealed animals this instinct gives them a second chance of escape in the earth or among the leaves, &c., when they have been once detected; animals with Warning Colours are, on the other hand, enabled to assume a position in which their characters are displayed to the full (Portschinski, *Lepidopterorum Rossiæ Biologia*, St. Petersburg, 1890, plate i. figs. 16, 17). In both cases a definite attitude is assumed, which is not that of death. Other warning characters exist in addition to colouring: thus sound is made use of by the disturbed Rattle-snake and the Indian *Echis*, &c. Large birds, when attacked, often adopt a threatening attitude, accompanied by a terrifying sound. The Cobra warns an intruder chiefly by attitude and the dilation of the flattened neck, the effect being heightened in some species by the "spectacles." In such cases we often see the combination of *Cryptic* and *Sematic* methods, the animal being concealed until disturbed, when it instantly assumes an Aposematic attitude. The advantage to the animal itself is clear: a poisonous snake gains nothing by killing an animal it cannot eat; while the poison does not cause immediate death, and the enemy would have time to injure or destroy the snake. In the case of small unpalatable animals with Warning Colours the enemies would

only first become aware of the unpleasant quality by tasting and often destroying their prey; but the species would gain by the experience thus conveyed, even though the individual might suffer. An insect-eating animal does not come into the world with knowledge: it has to be educated by experience, and Warning Colours enable this education as to what to avoid to be gained by a small instead of a large waste of life. Furthermore, great tenacity of life is usually possessed by animals with Warning Colours. The tissues of Aposematic insects generally possess great elasticity and power of resistance, so that large numbers of individuals can recover after very severe treatment.

The brilliant Warning Colours of many caterpillars attracted the attention of Darwin when he was thinking over his hypothesis of sexual selection, and he wrote to Wallace on the subject (Darwin, *Life and Letters*, London, 1887, vol. iii. p. 93). Wallace, in reply, suggested their interpretation as Warning Colours, a suggestion since verified by experiment (*Proc. Ent. Soc. Lond.*, 1867, p. lxxx; *Trans. Ent. Soc. Lond.*, 1869, pp. 21 and 27). Although animals with Warning Colours are probably but little attacked by the ordinary enemies of their class, they have special enemies which keep the numbers down to the average. Thus the cuckoo appears to be an insectivorous bird which will freely devour conspicuously coloured unpalatable larvæ. The effect of the Warning Colours of caterpillars is often intensified by gregarious habits. Another Aposematic use of colours and structures is to divert attention from the vital parts, and thus give the animal attacked an extra chance of escape. The large, conspicuous, easily torn wings of butterflies and moths act in this way, as is found by the abundance of individuals which may be captured with notches bitten symmetrically out of both wings when they were in contact. The eyespots and "tails" so common on the hinder part of the hind wing, and the conspicuous apex so frequently seen on the fore wing, probably have this meaning. Their position corresponds to the parts which are most often found to be notched. In some cases (*e.g.*, many *Lycœnidœ*) the "tail" and eye-spot combine to suggest the appearance of a head with antennæ at the posterior end of the butterfly, the deception being aided by movements of the hind wings. The flat-topped "tussocks" of hair on many caterpillars look like conspicuous fleshy projections of the body, and they are held prominently when the larva is attacked. If seized, the "tussock" comes out, and the enemy is greatly inconvenienced by the fine branched hairs. The tails of lizards, which easily break off, are to be similarly explained, the attention of the pursuer being probably still further diverted by the extremely active movements of the amputated member. Certain crabs similarly throw off their claws when attacked, and the claws continue to snap most actively. The tail of the dormouse, which easily comes off, and the extremely bushy tail of the squirrel, are probably of use in the same manner. Animals with Warning Colours often tend to resemble each other superficially. This fact was first pointed out by H. W. Bates in his paper on the Theory of Mimicry (*Trans. Linn. Soc.* vol. xxiii., 1862, p. 495). He showed that the conspicuous, presumably unpalatable, tropical American butterflies, belonging to very different groups, which are mimicked by others, also tend to resemble each other, the likeness being often remarkably exact. These resemblances were not explained by his theory of Mimicry, and he could only suppose that they had been produced by the direct influence of a common environment. The problem was solved in 1879 by Fritz Müller (see *Proc. Ent. Soc. Lond.*, 1879, p. xx), who suggested that life is saved by this resemblance between Warning Colours, inasmuch as the education of young inexperienced enemies is facilitated. Each species which falls into a group with Common Warning (*Synaposematic*) Colours contributes to save the lives of the other members. It is sufficiently obvious that the amount of learning and remembering, and consequently of injury and loss of life involved in the process, are reduced when many species in one place possess the same Aposematic colouring, instead of each exhibiting a different "danger-signal." These resemblances are often described as "Mullerian Mimicry," as distinguished from true or "Batesian Mimicry" described in the next section. Similar Synaposematic resemblances between the specially protected groups of butterflies were afterwards shown to exist in tropical Asia, the East Indian Islands, and Polynesia by F. Moore (*Proc. Zool. Soc.*, 1883, p. 201), and in Africa by E. B. Poulton (*Report Brit. Assoc.*, 1897, p. 688). R. Meldola (*Ann. and Mag. Nat. Hist.* x., 1882, p. 417) first pointed out and explained in the same manner the remarkable general uniformity of colour and pattern which runs through so many species of each of the distasteful groups of butterflies; while, still later, Poulton (*Proc. Zool. Soc.*, 1887, p. 191) similarly extended the interpretation to the Synaposematic resemblances between animals of all kinds in the same country. Thus, for example, longitudinal or circular bands of the same strongly contrasted colours are found in species of many groups with distant affinities.

Certain animals, especially the Crustacea, make use of the special defence and Warning Colours of other animals. Thus the English Hermit-crab, *Pagurus bernhardus*, commonly carries the Sea-anemone, *Sagartia parasitica*, on its shell; while another English species, *Pagurus prideauxii*, inhabits a shell which is invariably clothed by the flattened *Adamsia palliata*.

The white patch near the tail which is frequently seen in the gregarious Ungulates, and is often rendered conspicuous by adjacent black markings, probably assists the individuals in keeping together; and appearances with probably the same interpretation are found in many birds. The white upturned tail of the rabbit is probably of use in enabling the individuals to follow each other readily. The difference between a typical Aposematic character appealing to enemies, and Episematic intended for other individuals of the same species, is well seen when we compare such examples as (1) the huge banner-like white tail, conspicuously contrasted with the black or black and white body, by which the slow-moving skunk warns enemies of its power of emitting an intolerably offensive odour; (2) the small upturned white tail of the rabbit, only seen when it is likely to be of use and when the owner is moving, and, if pursued, very rapidly moving, towards safety.

*Mimicry, or Pseudo-sematic Colours.*—The fact that animals with distant affinities may more or less closely resemble each other was observed long before the existing explanation was possible. Its recognition is implied in a number of insect names with the termination *-formis*, usually given to species of various Orders which more or less closely resemble the stinging Hymenoptera. The usefulness of the resemblance was suggested in Kirby and Spence's *Introduction to Entomology*, London, 1817, vol. ii. p. 223. H. W. Bates (*Trans. Linn. Soc.* vol. xxiii. 1862, p. 495) first proposed an explanation of Mimicry based on the theory of Natural Selection. He supposed that every step in the formation and gradual improvement of the likeness occurred in consequence of its usefulness in the struggle for life. The subject is of additional interest, inasmuch as it was one of the first attempts to apply the theory of Natural Selection to a large class of phenomena up to that time well known but unexplained. Numerous

examples of Mimicry among tropical American butterflies were discussed by Bates in his paper; and in 1866 A. R. Wallace extended the hypothesis to the butterflies of the tropical East (*Trans. Linn. Soc.* vol. xxv., 1866, p. 19); Roland Trimen (*Trans. Linn. Soc.* vol. xxvi., 1870, p. 497) to those of Africa in 1870. The term Mimicry is used in various senses. It is often extended, as indeed it was by Bates, to include all the superficial resemblances between animals and any part of their environment. Wallace, however, separated the Cryptic Resemblances already described, and the majority of naturalists have followed this convenient arrangement. In Cryptic Resemblance an animal resembles some object of no interest to its enemy (or prey), and in so doing is concealed; in Mimicry an animal resembles some other animal which is specially disliked by its enemy, or some object which is specially attractive to its prey, and in so doing becomes conspicuous. Some naturalists have considered Mimicry to include all superficial likenesses between animals, but such a classification would group together resemblances which have widely different uses. (1) The resemblance of a mollusc to the coral on which it lives, or an external parasite to the hair or skin of its host, would be *Procryptic*; (2) that between moths which resemble lichen, *Syncryptic*; (3) between distasteful insects, *Synaposematic*; (4) between the Insectivor mole and the Rodent mole-rat, *Syntechnic*; (5) the essential element in Mimicry is that it is a false warning (Pseud-aposematic) or false recognition (Pseud-episematic) character. Some have considered that Mimicry indicates resemblance to a *moving object*; but apart from the non-mimetic likenesses between animals classified above, there are ordinary Cryptic Resemblances to drifting leaves, swaying bits of twig, &c., while truly Mimetic Resemblances are often specially adapted for the attitude of rest. Many use the term Mimicry to include *Synaposematic* as well as *Pseudo-sematic Resemblances*, calling the former "Müllerian," the latter "Batesian," Mimicry. The objection to this grouping is that it takes little account of the deceptive element which is essential in Mimicry. In Synaposematic colouring the warning is genuine, in Pseud-aposematic it is a sham. The term Mimicry has led to much misunderstanding from the fact that in ordinary speech it implies deliberate imitation. The production of Mimicry in an individual animal has no more to do with consciousness or "taking thought" than any of the other processes of growth. Protective Mimicry is here defined as an advantageous and superficial resemblance of one animal to another, which latter is specially defended so as to be disliked or feared by the majority of enemies of the groups to which both belong—a resemblance which appeals to the sense of sight, sometimes to that of hearing, and rarely to smell, but does not extend to deep-seated characters except when the superficial likeness is affected by them. *Mutatis mutandis* this definition will apply to Aggressive (Pseud-episematic) Resemblance. The conditions under which Mimicry occurs have been stated by Wallace:—"(1) that the imitative species occur in the same area and occupy the same station as the imitated; (2) that the imitators are always the more defenceless; (3) that the imitators are always less numerous in individuals; (4) that the imitators differ from the bulk of their allies; (5) that the imitation, however minute, is *external* and *visible* only, never extending to internal characters or to such as do not affect the external appearance." It is obvious that conditions 2 and 3 do not hold in the case of Müllerian Mimicry. Mimicry has been explained, independently of Natural Selection, by the supposition that it is the common expression of the direct action of common causes, such as climate, food, &c.; also by the supposition of independent lines of evolution leading to the same result without any selective action in consequence of advantage in the struggle; also by the operation of Sexual Selection.

It is proposed, in conclusion, to give an account of the broad aspects of Mimicry, and attempt a brief discussion of the theories of origin of each class of facts (see Poulton, *Linn. Soc. Journ. Zool.*, 1898, p. 558). It will be found that in many cases the argument here made use of applies equally to the origin of Cryptic and Sematic Colours. The relationship between these classes has been explained: Mimicry is, as Wallace has stated (*Darwinism*, London, 1889), merely "an exceptional form of protective resemblance." Now, protective (cryptic) resemblance cannot be explained on any of the lines suggested above, except natural selection; even sexual selection fails, because cryptic resemblance is especially common in the immature stages of insect life. But it would be unreasonable to explain Mimetic Resemblance by one set of principles and Cryptic by another and totally different set. Again, it may be plausible to explain the mimicry of one butterfly for another on one of the suggested lines, but the resemblance of a fly or moth to a wasp is by no means so easy, and here selection would be generally conceded; yet the appeal to antagonistic principles to explain such closely related cases would only be justified by much direct evidence. Furthermore, the mimetic resemblances between butterflies are not haphazard, but the models almost invariably belong only to certain sub-families, the *Danainæ* and *Acraeinæ* in all the warmer parts of the world, and, in tropical America, the *Ithomiinæ* and *Heliconinæ* as well. These groups have the characteristics of Aposematic species, and no theory but natural selection explains their invariable occurrence as models wherever they exist. It is impossible to suggest, except by natural selection, any explanation of the fact that mimetic resemblances are confined to changes which produce or strengthen a superficial likeness. Very deep-seated changes are generally involved, inasmuch as the appropriate instincts as to attitude, &c., are as important as colour and marking. The same conclusion is reached when we analyse the nature of mimetic resemblance and realize how complex it really is, being made up of *colours*, both pigmentary and structural, *pattern*, *form*, *attitude*, and *movement*. A plausible interpretation of colour may be wildly improbable when applied to some other element, and there is *no* explanation except natural selection which can explain all these elements. The appeal to the direct action of local conditions in common often breaks down upon the slightest investigation, the difference in habits between mimic and model in the same locality causing the most complete divergence in their conditions of life. Thus many insects produced from burrowing larvæ mimic those whose larvæ live in the open. Mimetic resemblance is far commoner in the female than in the male, a fact readily explicable by selection, as suggested by Wallace, for the female is compelled to fly more slowly and to expose itself while laying eggs, and hence a resemblance to the slow-flying freely exposed models is especially advantageous. The facts that mimetic species occur in the same locality, fly at the same time of the year as their models, and are day-flying species even though they may belong to nocturnal groups, are also more or less difficult to explain except on the theory of natural selection, and so also is the fact that mimetic resemblance is produced in the most varied manner. A spider resembles its model, an ant, by a modification of its body-form into a superficial resemblance, and by holding one pair of legs to represent antennæ; certain bugs (Hemiptera) and beetles have also gained a shape unusual in their respective groups, a shape which superficially resembles an ant; a Locustid (*Myrmecophana*) has the shape of an ant painted, as it were, on its body, all other parts resembling the back-

ground and invisible; a Membracid (Homoptera) is entirely unlike an ant, but is concealed by an ant-like shield. When we further realize that in this and other examples of Mimicry "the likeness is almost always detailed and remarkable, however it is attained, while the methods differ absolutely," we recognize that natural selection is the only possible explanation hitherto suggested. In the cases of Aggressive Mimicry an animal resembles some object which is attractive to its prey. Examples are found in the flower-like species of Mantis, which attract the insects on which they feed. Such cases are generally described as possessing "*alluring colours*," and are regarded as examples of *Aggressive* (*Anticryptic*) *Resemblance*, but their logical position is here.

*Colours displayed in Courtship, Secondary Sexual Characters, Epigamic Colours.*—Darwin suggested the explanation of these appearances in his theory of *Sexual Selection* (*The Descent of Man*, London, 1874). The rivalry of the males for the possession of the females he believed to be decided by the preference of the latter for those individuals with especially bright colours, highly developed plumes, beautiful song, &c. Wallace does not accept the theory, but believes that natural selection, either directly or indirectly, accounts for all the facts. Probably the majority of naturalists follow Darwin in this respect. The subject is most difficult, and the interpretation of a great proportion of the examples in a high degree uncertain, so that a very brief account is here expedient. That selection of some kind has been operative is indicated by the diversity of the elements into which the effects can be analysed. The most complete set of observations on Epigamic display was made by George W. and Elizabeth G. Peckham upon spiders of the family *Attidæ* (*Nat. Hist. Soc. of Wisconsin*, vol. i., 1889). These observations afforded the authors "conclusive evidence that the females pay close attention to the love-dances of the males, and also that they have not only the power, but the will, to exercise a choice among the suitors for their favour." Epigamic characters are often concealed except during courtship; they are found almost exclusively in species which are diurnal or semi-diurnal in their habits, and are excluded from those parts of the body which move too rapidly to be seen. They are very commonly directly associated with the nervous system; and in certain fish, and probably in other animals, an analogous heightening of effect accompanies nervous excitement other than sexual, such as that due to fighting or feeding. Although there is Epigamic display in species with sexes alike, it is usually most marked in those with secondary sexual characters specially developed in the male. These are an exception to the rule in heredity, in that their appearance is normally restricted to a single sex, although in many of the higher animals they have been proved to be latent in the other, and may appear after the essential organs of sex have been removed or become functionless. This is also the case in the Aculeate Hymenoptera when the reproductive organs have been destroyed by the parasite (*Stylops*). Cunningham has recently argued (*Sexual Dimorphism in the Animal Kingdom*, London, 1900) that secondary sexual characters have been produced by direct stimulation due to contests, &c., in the breeding period, and have gradually become hereditary, a hypothesis involving the assumption that acquired characters are transmitted. Wallace suggests that they are in part to be explained as "Recognition Characters," in part as an indication of surplus vital activity in the male.

II. CHEMISTRY.

The coloration of the *surface* of animals is caused either by *pigments*, or by a certain *structure* of the surface by means of which the light falling on it, or reflected through its superficial transparent layers, undergoes diffraction or other optical change. Or it may be the result of a combination of these two causes. It plays an important part in the relationship of the animal to its environment, in concealment, in mimicry, and so on; the presence of a pigment in the integument may also serve a more direct physiological purpose, such as a respiratory function. The coloration of birds' feathers, of the skin of many fishes, of many insects, is partially at least due to structure and the action of the peculiar pigmented cells known as "chromatophores" (which Garstang defines as pigmented cells specialized for the discharge of the chromatic function) and is much better marked when these have for their background a "reflecting layer" such as is provided by guanin, a substance closely related to uric acid. Such a mechanism is seen to greatest advantage in fishes. Among these, guanin may be present in a finely granular form, causing the light falling on it to be scattered, thus producing a white effect; or it may be present in a peculiar crystalline form, the crystals being known as "iridocytes"; or in a layer of closely apposed needles forming a silvery sheet or mirror. In the iris of some fishes the golden red colour is produced by the light reflected from such a layer of guanin needles having to pass through a thin layer of a reddish pigment, known as a "lipochrome." Again, in some lepidopterous insects a white or a yellow appearance is produced by the deposition of uric acid or a nearly allied substance on the surface of the wings. In many animals, but especially among invertebrates, colouring matters or pigments play an important rôle in surface coloration; in some cases such coloration may be of benefit to the animal, but in others the integument simply serves as an organ for the excretion of waste pigmentary substances. Pigments (1) may be of direct physiological importance; (2) they may be excretory; or (3) they may be introduced into the body of the animal with the food.

Of the many pigments which have been described up to the present time, very few have been subjected to elementary chemical analysis, owing to the great difficulties attending their isolation. An extremely small amount of pigment will give rise to a great amount of coloration, and the pigments are generally accompanied by impurities of various kinds which cling to them with great tenacity, so that when one has been thoroughly cleansed, very little of it remains for ultimate analysis. Most of these substances have been detected by means of the spectroscope, their absorption bands serving for their recognition, but mere identity of spectrum does not necessarily mean chemical identity, and a few chemical tests have also to be applied before a conclusion can be drawn. The absorption bands are referred to certain definite parts of the spectrum, such as the Fraunhofer lines, or they may be given in wave-lengths. For this purpose the readings of the spectroscope are reduced to wave-lengths by means of interpolation curves; or if Zeiss's microspectroscope be used, the position of bands in wave-lengths (denoted by the Greek letter $\lambda$) may be read directly. Examples of the absorption bands yielded by colouring matters will be found in *Ency. Brit.* vol. xx. p. 483.

Hæmoglobin, the red colouring matter of vertebrate blood, $C_{758}H_{1203}N_{195}S_3FeO_{218}$, and its derivatives hæmatin, $C_{32}H_{30}N_4FeO_3$, and hæmatoporphyrin, $C_{16}H_{18}N_2O_3$, are

colouring matters about which we possess definite chemical knowledge, as they have been isolated, purified, and analysed. Most of the bile pigments of mammals have likewise been isolated and studied chemically, and all of these are fully described in the text-books of physiology and physiological chemistry. Hæmoglobin, though physiologically of great importance in the respiratory process of vertebrate animals, is yet seldom used for surface pigmentation, except in the face of white races of man or in other parts in monkeys, &c. In some worms the transparent skin allows the hæmoglobin of the blood to be seen through the integument, and in certain fishes also the hæmoglobin is visible through the integument. It is a curious and noteworthy fact that in some invertebrate animals in which no hæmoglobin occurs, we meet with its derivatives. Thus hæmatin is found in the so-called bile of slugs, snails, the limpet, and the crayfish. In sea-anemones there is a pigment which yields some of the decomposition-products of hæmoglobin, and associated with this is a green pigment apparently identical with biliverdin ($C_{16}H_{18}N_2O_4$), a green bile pigment. Again, hæmatoporphyrin is found in the integuments of star-fishes and slugs, and occurs in the "dorsal streak" of the earth-worm (*Lumbricus terrestris*), and perhaps in other species. Hæmatoporphyrin and biliverdin also occur in the egg-shells of certain birds, but in this case they are derived from hæmoglobin. Hæmoglobin is said to be found as low down in the animal kingdom as the Echinoderms, *e.g.*, in *Ophiactis virens*, and *Thyonella gemmata*. It also occurs in the blood of *Planorbis corneus*, and in the pharyngeal muscles of other mollusca.

A great number of other pigments have been described; for example, in the muscles and tissues of animals, both vertebrate and invertebrate, are the histohæmatins, of which a special muscle pigment, myohæmatin, is one. In vertebrates the latter is generally accompanied by hæmoglobin, but in invertebrates—with the exception of the pharyngeal muscles of the mollusca—it occurs alone. Although closely related to hæmoglobin or its derivative hæmochromogen, the histohæmatins are yet totally distinct, and they are found in animals where not a trace of hæmoglobin can be detected. Another interesting pigment is turacin, which contains about 7 per cent. of nitrogen, found by Professor Church in the feathers of the Cape lory and other plantain-eaters, from which it can be extracted by water containing a trace of ammonia. It has been isolated, purified, and analysed by Professor Church. From it may be obtained turacoporphyrin, which is identical with hæmatoporphyrin, and gives the band in the ultra-violet which Soret and subsequently Gamgee have found to be characteristic of hæmoglobin and its compounds. Turacin itself gives a peculiar two-banded spectrum, and contains about 7 per cent. of copper in its molecule. Another copper-containing pigment is hæmocyanin, which in the oxidized state gives a blue colour to the blood of various mollusca and arthropoda. Like hæmoglobin, it acts as an oxygen-carrier in respiration, but it takes no part in surface coloration.

A class of pigments widely distributed among plants and animals are the lipochromes. As their name denotes, they are allied to fat and generally accompany it, being soluble in fat solvents. They play an important part in surface coloration, and may be greenish, yellow, or red in colour. They contain no nitrogen. As an example of a lipochrome which has been isolated, crystallized, and purified, we may mention carotin, which has recently been found in green leaves. Chlorophyll, which is so often associated with a lipochrome, has been found in some Infusoria, and in *Hydra* and *Spongilla*, &c. In some cases it is probably formed by the animal; in other cases it may be due to symbiotic algæ, while in the gastric gland of many Mollusca, Crustacea, and Echinodermata, it is derived from food-chlorophyll. Here it is known as entero-chlorophyll. The black pigments which occur among both vertebrate and invertebrate animals often have only one attribute in common, viz., blackness, for among the discordant results of analysis one thing is certain, viz., that the melanins from vertebrate animals are not identical with those from invertebrate animals. The melanosis or blackening of insect blood, for instance, is due to the oxidation of a chromogen, the pigment produced being known as a uranidine. In some sponges a somewhat similar pigment has been noticed. Other pigments have been described, such as actiniochrome, echinochrome, pentacrinin, antedonin, polyperythrin (which appears to be a hæmatoporphyrin), the floridines, spongioporphyrin, &c., which need no mention here; all these pigments can only be distinguished by means of the spectroscope.

Most of the pigments are preceded by colourless substances known as "chromogens," which by the action of the oxygen of the air and by other agencies become changed into the corresponding pigments. In some cases the pigments are built up in the tissues of an animal, in others they appear to be derived more or less directly from the food. Derivatives of chlorophyll and lipochromes especially, seem to be taken up from the intestine, probably by the agency of leucocytes, in which they may occur in combination with, or dissolved by, fatty matters and excreted by the integument. In worms especially, the skin seems to excrete many effete substances, pigments included. No direct connexion has been traced between the chlorophyll eaten with the food and the hæmoglobin of blood and muscle. Attention may, however, be drawn to the work of Dr Schunck, who has shown that a substance closely resembling hæmatoporphyrin can be prepared from chlorophyll; this is known as phylloporphyrin. Not only does the *visible* spectrum of this substance resemble that of hæmatoporphyrin, but the *invisible* ultra-violet also, as recently shown by Mr C. A. Schunck.

The reader may refer to Schäfer's *Text-Book of Physiology* (1898) for Gamgee's article "On Hæmoglobin, and its Compounds"; to the writer's papers in the *Phil. Trans.* and *Proc. Roy. Soc.* from 1881 onwards, and also *Quart. Journ. Micros. Science* and *Journ. of Physiol.*; to Krukenberg's *Vergleichende physiologische Studien* from 1879 onwards, and to his *Vorträge.* Miss Newbigin has collected in *Colour in Nature* (1898) most of the recent literature of this subject. Dr Schunck's papers will be found under the heading "Contribution to the Chemistry of Chlorophyll" in *Proc. Roy. Soc.* from 1885 onwards; and Mr C. A. Schunck's paper in *Proc. Roy. Soc.* vol. lxiii. (C. A. MACM.)

**Columbia,** capital of Boone county, Missouri, U.S.A., situated in 38° 57′ N. lat. and 92° 19′ W. long., in the central part of the state, on the Wabash Railway, at an altitude of 783 feet. It is the site of the State University, and of Christian and Stephens Female Colleges. Population (1880), 3326; (1890), 4000; (1900), 5651.

**Columbia,** a borough of Lancaster county, Pennsylvania, U.S.A., situated on the east bank of Susquehanna river, in the south-eastern part of the state, on branches of the Pennsylvania and the Philadelphia and Reading Railways, at an altitude of 251 feet. It has extensive manufactures, principally of iron. Population (1880), 8312; (1890), 10,599; (1900), 12,316.

**Columbia,** capital of Richland county, South Carolina, U.S.A., and of the state, situated in 34° 00′ N. lat. and 80° 57′ W. long. on the east bank of Congaree river, at the junction of the Saluda and Broad, near the centre of the state, at an altitude of 244 feet.

Five railways enter it, namely, the Atlantic Coast Line, the Southern, the South Carolina and Georgia, the Florida Central and Peninsula, and the Columbia, Newberry, and Laurens. It is the seat of South Carolina College, which in 1898 had twelve professors and 188 students. Population (1880), 10,036; (1890), 15353; (1900), 21,108.

**Columbia,** capital of Maury county, Tennessee, U.S.A., situated on Duck river, in the central part of the state, at an altitude of 646 feet. It has two railways, the Louisville and Nashville and the Nashville, Chattanooga, and St Louis. Population (1880), 3400; (1890), 5370; (1900), 6052.

**Columbia, District of.** See WASHINGTON.

**Columbia University,** in the city of New York, U.S.A., includes both a college and a university in the strict sense of the word as used in the United States. It comprises the faculties of law, medicine, philosophy, political science, pure science, and applied science. It is the successor of the corporation known as "The Governors of King's College, in the Province of New York," founded in 1754 by royal charter. In the educational system is also included Barnard College for Women, a separate corporation founded in 1889, and a teachers' college, also a separate corporation. In 1897 the university moved from the centre of the city northwards to Morningside Heights, which overlook the Hudson from an altitude of 150 feet. The Medical School (the College of Physicians and Surgeons) remains in its old location opposite Roosevelt Hospital. The entire plant of the university represents a cost of about $9,500,000. In the year ending 30th June 1900 the expenditures for educational purposes were $942,460, leaving a deficiency of $17,328, which was met by a special guarantee fund. In 1901 there were registered in the college for men (Columbia) 475 students, and in the college for women (Barnard) 293 students, making a total of 768 undergraduates. The total of non-professional graduate students was 412. The scientific schools contained 539 students, the law school 422 students, the medical school 775 students, the teachers' college 498 students—making a total of 2234 professional students. The total number of students in the university was thus 3830 (including 417 summer session students). In addition to these there were 29 auditors and 679 members of extension courses, making a grand total of 4538. The number of teachers of all grades for the same year was 375. The library, which numbers about 300,000 volumes, is thoroughly modern, and is selected with special reference to scholarly uses. The university is growing in all departments. (See also UNIVERSITIES and EDUCATION.) (S. L*.)

**Columbus,** capital of Muscogee county, Georgia, U.S.A., situated on the western boundary of the state, at an altitude of 260 feet, on Chattahoochee river, which is navigable to this point. Just above the city the river crosses the fall line, producing falls and rapids which furnish excellent water-power. This has been turned to account in extensive cotton manufactures. Three railways enter the city, the Southern, the Central of Georgia, and the Georgia and Alabama. Population (1880), 10,123; (1890), 17,303; (1900), 17,614.

**Columbus,** capital of Bartholomew county, Indiana, U.S.A., situated on the east fork of White river, a little south of the centre of the state, at an altitude of 629 feet. It is at the intersection of lines of the Pittsburg, Cincinnati, Chicago, and St Louis and the Cleveland, Cincinnati, Chicago, and St Louis Railways. The centre of population of the United States was in 1900 very near this place. Population (1880), 4813; (1890), 6719; (1900), 8130.

**Columbus,** capital of Lowndes county, Mississippi, U.S.A., at the intersection of the Southern and the Mobile and Ohio Railways, on the Tombigbee river. It contains large cotton mills. Population (1890), 4559; (1900, with limits enlarged), 6484, including 3366 negroes.

**Columbus,** capital of Franklin county, Ohio, U.S.A., and of the state of Ohio. The site was purposely selected in 1813 near the centre of the state, in 39° 57′ N. lat. and 82° 59′ W. long., at an altitude of 743 feet, the elevation of the lines at the Union Station. It is a railway centre of the first importance. Fourteen different lines of railway, belonging to eight companies, enter the fine new Union Station in the heart of the city, thence radiating in all directions. The manufactures employed in 1890 a capital of $16,178,703, with 13,421 hands and an output of $22,887,586. The principal manufacture was that of carriages and waggons, valued at $3,199,287. Foundry and machine-shop products were second, with a value of $2,139,185. Then followed the manufacture of steam cars, the product of which was valued at $1,670,078. The Ohio State University, situated here, had in 1898 a faculty of 95 professors, and was attended by 1150 students, one-fifth of whom were women. Its property was valued at $2,600,000, and its income at $292,000. It has schools of law, medicine, dentistry, pharmacy, and veterinary surgery. Capital University, a Lutheran institution, also here, had in 1898 a faculty of 10 teachers and 113 students. The death-rate in 1899 was but 10·83 per thousand; this is less than half the average of American cities, and little more than half that of the Union. The assessed valuation of property, real and personal, was, in 1899, $64,344,990. The income from all sources was $2,612,301, the expenditure $2,570,038, and the net debt $6,059,146. The tax rate per $1000 was $27.50. Population (1880), 51,647; (1890), 88,150; (1900), 125,560; death-rate (1900), 15·8.

**Combaconum,** or Kumbakonam, a city of British India, in the Tanjore district of Madras, in the delta of the Kaveri; with a railway station on the South Indian Railway, 194 miles from Madras. In 1881 it had a population of 50,098, and in 1891 of 54,307, of whom nearly one-fifth were Brahmans. In 1901 the population was 59,688, showing an increase of 10 per cent. The municipal income in 1897–98 was Rs.80,480. It contains a Government college, two high schools, four printing-presses, and a reading-room.

**Combinatorial Analysis.**—The Combinatorial Analysis, as it was understood up to the end of the 18th century, was of limited scope and restricted application. P. Nicholson, in his *Essays on the Combinatorial Analysis*, published in 1818, states that "the Combinatorial Analysis is a branch of mathematics which teaches us to ascertain and exhibit all the possible ways in which a given number of things may be associated and mixed together; so that we may be certain that we have not missed any collection or arrangement of these things that has not been enumerated." Writers on the subject seemed to recognize fully that it was in need of cultivation, that it was of much service in facilitating algebraical operations of all kinds, and that it was the fundamental method of investigation in the theory of Probabilities. Some idea of its scope may be gathered from a statement of the parts of algebra to which it was commonly applied, viz., the expansion of a multinomial, the product of two or more multinomials, the quotient of one multinomial by another, the reversion and conversion of series, the theory of indeterminate equations, &c. Some of the elementary theorems and various particular problems appear in the works of the

***Historical introduction.***

earliest algebraists, but the true pioneer of modern researches seems to have been Abraham Demoivre, who first published in 1697 (*Phil. Trans. R. S.*) the law of the general coefficient in the expansion of the series $a+bx+cx^2+dx^3+\ldots$ raised to any power. (See also *Miscellanea Analytica*, Bk. iv. chap. ii. prob. iv.) His work on Probabilities would naturally lead him to consider questions of this nature. An important work at the time it was published was the *De Partitione Numerorum* of Euler, in which the consideration of the reciprocal of the product $(1-xz)(1-x^2z)(1-x^3z)\ldots$ establishes a fundamental connexion between arithmetic and algebra, arithmetical addition being made to depend upon algebraical multiplication, and a close bond is secured between the theories of discontinuous and continuous quantities. The multiplication of the two powers $x^a$, $x^b$, viz., $x^a \times x^b = x^{a+b}$ showed Euler that he could convert arithmetical addition into algebraical multiplication, and in the paper referred to he gives the complete formal solution of the main problems of the partition of numbers. He did not obtain general expressions for the coefficients which arose in the expansion of his generating functions, but he gave the actual values to a high order of the coefficients which arise from the generating functions corresponding to various conditions of partitionment. Other writers who have contributed to the solution of special problems are James Bernouilli, Boscovitch, Hindenburgh, Emerson, Woodhouse, Simpson, and Barlow. Problems of combination were generally undertaken as they became necessary for the advancement of some particular part of mathematical science: it was not recognized that the theory of combinations is in reality a science by itself, well worth studying for its own sake irrespective of applications to other parts of analysis. There was a total absence of orderly development, and until the first third of the 19th century had passed, Euler's classical paper remained alike the chief result and the only scientific method of combinatorial analysis.

In 1846 Jacobi studied the partitions of numbers by means of certain identities involving infinite series that are met with in the theory of Elliptic Functions. The method employed is essentially that of Euler. Interest in England was aroused, in the first instance, by De Morgan in 1846, who, in a letter to Henry Warburton, suggested that combinatorial analysis stood in great need of development, and alluded to the theory of partitions. Warburton, to some extent under the guidance of De Morgan, prosecuted researches by the aid of a new instrument, viz., the theory of finite differences. This was a distinct advance, and he was able to obtain expressions for the coefficients in partition series in some of the simplest cases (*Trans. Camb. Phil. Soc.*, 1849). This paper inspired a valuable paper by Sir John Herschel (*Phil. Trans. Roy. Soc.*, 1850), who, by introducing the idea and notation of the circulating function, was able to present results in advance of those of Warburton. The new idea involved a calculus of the imaginary roots of unity. Shortly afterwards, in 1855, the subject was attacked simultaneously by Cayley and Sylvester, and their combined efforts resulted in the practical solution of the problem that we have to-day. The former added the idea of the prime circulator, and the latter applied Cauchy's theory of Residues to the subject, and invented the arithmetical entity termed a "denumerant." The next distinct advance was made by Sylvester, Franklin, Durfee, and others, about the year 1882 (*Amer. Journ. Math.* vol. v.) by the employment of a graphical method. The results obtained were not only valuable in themselves, but also threw considerable light upon the theory of algebraic series. So far it will be seen that researches had for their object the discussion of the partition of numbers. Other branches of combinatorial analysis were, from any general point of view, absolutely neglected. In 1888 MacMahon investigated the general problem of distribution, of which the partition of a number is a particular case. He introduced the method of symmetric functions and the method of differential operators, applying both methods to the two important subdivisions, the theory of composition and the theory of partition. He introduced the notion of the separation of a partition, and extended all the results so as to include multipartite as well as unipartite numbers. He showed how to introduce zero and negative numbers, unipartite and multipartite, into the general theory; he extended Sylvester's graphical method to three dimensions; and finally, 1898, he invented the "Partition Analysis" and applied it to the solution of novel questions in arithmetic and algebra. An important paper by G. B. Mathews, which reduces the problem of compound partition to that of simple partition, should also be noticed. This is the problem which was known to Euler and his contemporaries as "the Problem of the Virgins," or "the Rule of Ceres"; it is only now, nearly 200 years later, that it has been solved.

*Fundamental Problem.*

The most important problem of combinatorial analysis is connected with the distribution of objects into classes. A number $n$ may be regarded as enumerating $n$ similar objects; it is then said to be unipartite. On the other hand, if the objects be not all similar they cannot be effectively enumerated by a single integer; we require a succession of integers. If the objects be $p$ in number of one kind, $q$ of a second kind, $r$ of a third, &c., the enumeration is given by the succession $pqr\ldots$ which is termed a multipartite number, and written

$$\overline{pqr\cdots},$$

where $p+q+r+\ldots=n$. If the order of magnitude of the numbers $p, q, r, \ldots$ is immaterial, it is usual to write them in descending order of magnitude, and the succession may then be termed a partition of the number $n$, and is written $(pqr\ldots)$. The succession of integers thus has a twofold signification: (i.) as a multipartite number it may enumerate objects of different kinds; (ii.) it may be viewed as a partitionment into separate parts of a unipartite number. We may say either that the objects are represented by the multipartite number $\overline{pqr\ldots}$, or that they are defined by the partition $(pqr\ldots)$ of the unipartite number $n$. Similarly the classes into which they are distributed may be $m$ in number all similar; or they may be $p_1$ of one kind, $q_1$ of a second, $r_1$ of a third, &c., where $p_1+q_1+r_1+\ldots=m$. We may thus denote the classes either by the multipartite numbers $\overline{p_1q_1r_1\cdots}$, or by the partition $(p_1q_1r_1\ldots)$ of the unipartite number $m$. The distributions to be considered are such that any number of objects may be in any one class subject to the restriction that no class is empty. Two cases arise. If the order of the objects in a particular class is immaterial the class is termed a parcel; if the order is material the class is termed a group. The distribution into parcels is alone considered here, and the main problem is the enumeration of the distributions of objects defined by the partition $(pqr\ldots)$ of the number $n$ into parcels defined by the partition $(p_1q_1r_1\ldots)$ of the number $m$. (See "Symmetric Functions and the Theory of Distributions," *Proc. London Mathematical Society*, vol. xix.) Three particular cases are of great importance. Case I. is the "one-to-one distribution," in which the number of parcels is equal to the number of objects, and one object is distributed in each parcel. Case II. is that in which the parcels are all different, being defined by the partition $(1111\ldots)$, con-

veniently written $(1^m)$; this is the theory of the compositions of unipartite and multipartite numbers. Case III. is that in which the parcels are all similar, being defined by the partition $(m)$; this is the theory of the partitions of unipartite and multipartite numbers. Previous to discussing these in detail, it is necessary to describe the method of symmetric functions which will be largely utilized.

Let $\alpha, \beta, \gamma, \ldots$ be the roots of the equation

$$x^n - a_1 x^{n-1} + a_2 x^{n-2} - \ldots = 0.$$

***The Distribution Function.*** The symmetric function $\Sigma\alpha^p\beta^q\gamma^r \ldots$, where $p+q+r+\ldots=n$ is, in the partition notation, written $(pqr\ldots)$. Let $A_{(pqr\ldots),(p_1q_1r_1\ldots)}$ denote the number of ways of distributing the $n$ objects defined by the partition $(pqr\ldots)$ into the $m$ parcels defined by the partition $(p_1q_1r_1\ldots)$. The expression

$$\Sigma A_{(pqr\ldots),(p_1q_1r_1\ldots)} \cdot (pqr\ldots),$$

where the numbers $p_1, q_1, r_1 \ldots$ are fixed and assumed to be in descending order of magnitude, the summation being for every partition $(pqr\ldots)$ of the number $n$, is defined to be the distribution function of the objects defined by $(pqr\ldots)$ into the parcels defined by $(p_1q_1r_1\ldots)$. It gives a complete enumeration of $n$ objects of whatever species into parcels of the given species.

1. *One-to-One Distribution. Parcels* m *in number* (*i.e.* m=n).—

***Case I.*** Let $h_s$ be the homogeneous product-sum of degree $s$ of the quantities $\alpha, \beta, \gamma, \ldots$ so that

$$(1-\alpha x \,.\, 1-\beta x \,.\, 1-\gamma x \,.\, \ldots)^{-1} = 1 + h_1x + h_2x^2 + h_3x^3 + \ldots$$
$$h_1 = \Sigma\alpha = (1)$$
$$h_2 = \Sigma\alpha^2 + \Sigma\alpha\beta = (2) + (1^2)$$
$$h_3 = \Sigma\alpha^3 + \Sigma\alpha^2\beta + \Sigma\alpha\beta\gamma = (3) + (21) + (1^3).$$
$$\cdot \quad \cdot \quad \cdot \quad \cdot \quad \cdot \quad \cdot \quad \cdot$$

Form the product $h_{p_1}h_{q_1}h_{r_1}\ldots$

Any term in $h_{p_1}$ may be regarded as derived from $p_1$ objects distributed into $p_1$ similar parcels, one object in each parcel, since the order of occurrence of the letters $\alpha, \beta, \gamma, \ldots$ in any term is immaterial. Moreover, every selection of $p_1$ letters from the letters in $\alpha^p\beta^q\gamma^r\ldots$ will occur in some term of $h_{p_1}$, every further selection of $q_1$ letters will occur in some term of $h_{q_1}$, and so on. Therefore in the product $h_{p_1}h_{q_1}h_{r_1}\ldots$ the term $\alpha^p\beta^q\gamma^r\ldots$, and therefore also the symmetric function $(pqr\ldots)$ will occur as many times as it is possible to distribute objects defined by $(pqr\ldots)$ into parcels defined by $(p_1q_1r_1\ldots)$ one object in each parcel. Hence

$$\Sigma A_{(pqr\ldots),(p_1q_1r_1\ldots)} \cdot (pqr\ldots) = h_{p_1}h_{q_1}h_{r_1}\ldots$$

This theorem is of algebraic importance; for consider the simple particular case of the distribution of objects (43) into parcels (52), and represent objects and parcels by small and capital letters respectively. One distribution is shown by the scheme

A A A A A B B
*a a a a b b b*

wherein an object denoted by a small letter is placed in a parcel denoted by the capital letter immediately above it. We may interchange small and capital letters and derive from it a distribution of objects (52) into parcels (43); viz. :—

A A A A B B B
*a a a a a b b*

The process is clearly of general application, and establishes a one-to-one correspondence between the distributions of objects $(pqr\ldots)$ into parcels $(p_1q_1r_1\ldots)$ and the distributions of objects $(p_1q_1r_1\ldots)$ into parcels $(pqr\ldots)$. It is in fact, in Case I., an intuitive observation that we may either consider an object placed in or attached to a parcel, or a parcel placed in or attached to an object. Analytically we have

*Theorem.*—"The coefficient of symmetric function $(pqr\ldots)$ in the development of the product $h_{p_1}h_{q_1}h_{r_1}\ldots$ is equal to the coefficient of symmetric function $(p_1q_1r_1\ldots)$ in the development of the product $h_ph_qh_r\ldots$."

The problem of Case I. may be considered when the distributions are subject to various restrictions. If the restriction be to the effect that an aggregate of similar parcels is not to contain more than one object of a kind, we have clearly to deal with the elementary symmetric functions $a_1, a_2, a_3, \ldots$ or $(1), (1^2), (1^3), \ldots$ in lieu of the quantities $h_1, h_2, h_3, \ldots$ The distribution function has then the value $a_{p_1}a_{q_1}a_{r_1}\ldots$ or $(1^{p_1})(1^{q_1})(1^{r_1})\ldots$, and by interchange of object and parcel we arrive at the well-known theorem of symmetry in symmetric functions, which states that the coefficient of symmetric function $(pqr\ldots)$ in the development of the product $a_{p_1}a_{q_1}a_{r_1}\ldots$ in a series of monomial symmetric functions, is equal to the coefficient of the function $(p_1q_1r_1\ldots)$ in the similar development of the product $a_pa_qa_r\ldots$

The general result of Case I. may be further analysed with important consequences.

Write
$$X_1 = (1)x_1,$$
$$X_2 = (2)x_2 + (1^2)x_1^2,$$
$$X_3 = (3)x_3 + (21)x_2x_1 + (1^3)x_1^3$$
$$\cdot \quad \cdot \quad \cdot \quad \cdot \quad \cdot \quad \cdot \quad \cdot$$

and generally $\quad X_s = \Sigma(\lambda\mu\nu\ldots)x_\lambda x_\mu x_\nu\ldots$

the summation being in regard to every partition of $s$. Consider the result of the multiplication—

$$X_{p_1}X_{q_1}X_{r_1}\ldots = \Sigma P x_{s_1}^{\sigma_1}x_{s_2}^{\sigma_2}x_{s_3}^{\sigma_3}\ldots$$

To determine the nature of the symmetric function P a few definitions are necessary.

*Definition I.*—Of a number $n$ take any partition $(\lambda_1\lambda_2\lambda_3\ldots\lambda_s)$ and separate it into component partitions thus :—

$$(\lambda_1\lambda_2)(\lambda_3\lambda_4\lambda_5)(\lambda_6)\ldots$$

in any manner. This may be termed a *separation* of the partition, the numbers occurring in the separation being identical with those which occur in the partition. In the theory of symmetric functions the separation denotes the product of symmetric functions—

$$\Sigma\alpha^{\lambda_1}\beta^{\lambda_2}\Sigma\alpha^{\lambda_3}\beta^{\lambda_4}\gamma^{\lambda_5}\Sigma\alpha^{\lambda_6}\ldots$$

The portions $(\lambda_1\lambda_2)$, $(\lambda_3\lambda_4\lambda_5)$, $(\lambda_6)$, . . are termed *separates*, and if $\lambda_1+\lambda_2=p_1$, $\lambda_3+\lambda_4+\lambda_5=q_1$, $\lambda_6=r_1, \ldots$ be in descending order of magnitude, the usual arrangement, the separation is said to have a *species* denoted by the partition $(p_1q_1r_1\ldots)$ of the number $n$.

*Definition II.*—If in any distribution of $n$ objects into $n$ parcels (one object in each parcel), we write down a number $\xi$, whenever we observe $\xi$ similar objects in similar parcels we will obtain a succession of numbers $\xi_1, \xi_2, \xi_3, \ldots$, where $(\xi_1\xi_2\xi_3\ldots)$ is some partition of $n$. The distribution is then said to have a *specification* denoted by the partition $(\xi_1\xi_2\xi_3\ldots)$.

Now it is clear that P consists of an aggregate of terms, each of which, to a numerical factor *près*, is a separation of the partition $(s_1^{\sigma_1}s_2^{\sigma_2}s_3^{\sigma_3}\ldots)$ of species $(p_1q_1r_1\ldots)$. Further, P is the distribution function of objects into parcels denoted by $(p_1q_1r_1\ldots)$, subject to the restriction that the distributions have each of them the specification denoted by the partition $(s_1^{\sigma_1}s_2^{\sigma_2}s_3^{\sigma_3}\ldots)$. Employing a more general notation we may write

$$X_{p_1}^{\pi_1}X_{p_2}^{\pi_2}X_{p_3}^{\pi_3}\ldots = \Sigma P x_{s_1}^{\sigma_1}x_{s_2}^{\sigma_2}x_{s_3}^{\sigma_3}\ldots$$

and then P is the distribution function of objects into parcels $(p_1^{\pi_1}p_2^{\pi_2}p_3^{\pi_3}\ldots)$, the distributions being such as have the specification $(s_1^{\sigma_1}s_2^{\sigma_2}s_3^{\sigma_3}\ldots)$. Multiplying out P so as to exhibit it as a sum of monomials, we get a result—

$$X_{p_1}^{\pi_1}X_{p_2}^{\pi_2}X_{p_3}^{\pi_3}\ldots = \Sigma\Sigma\theta(\lambda_1^{l_1}\lambda_2^{l_2}\lambda_3^{l_3}\ldots)x_{s_1}^{\sigma_1}x_{s_2}^{\sigma_2}x_{s_3}^{\sigma_3}\ldots$$

indicating that for distributions of specification $(s_1^{\sigma_1}s_2^{\sigma_2}s_3^{\sigma_3}\ldots)$ there are $\theta$ ways of distributing $n$ objects denoted by $(\lambda_1^{l_1}\lambda_2^{l_2}\lambda_3^{l_3}\ldots)$ amongst $n$ parcels denoted by $(p_1^{\pi_1}p_2^{\pi_2}p_3^{\pi_3}\ldots)$, one object in each parcel. Now observe that as before we may interchange parcel and object, and that this operation leaves the specification of the distributions unchanged. Hence the number of distributions must be the same, and if

$$X_{p_1}^{\pi_1}X_{p_2}^{\pi_2}X_{p_3}^{\pi_3}\ldots = \ldots + \theta(\lambda_1^{l_1}\lambda_2^{l_2}\lambda_3^{l_3}\ldots)x_{s_1}^{\sigma_1}x_{s_2}^{\sigma_2}x_{s_3}^{\sigma_3}\ldots + \ldots$$

then also

$$X_{\lambda_1}^{l_1}X_{\lambda_2}^{l_2}X_{\lambda_3}^{l_3}\ldots = \ldots + \theta(p_1^{\pi_1}p_2^{\pi_2}p_3^{\pi_3}\ldots)x_{s_1}^{\sigma_1}x_{s_2}^{\sigma_2}x_{s_3}^{\sigma_3}\ldots + \ldots$$

This extensive theorem of algebraic reciprocity includes many known theorems of symmetry in the theory of Symmetric Functions.

The whole of the theory has been extended to include symmetric functions symbolized by partitions which contain as well zero and negative parts.

2. *The Compositions of Multipartite Numbers. Parcels denoted by* $(1^m)$.—There are here no similarities between the parcels.

*Case II.* Let $(\pi_1\ \pi_2\ \pi_3 \dots)$ be a partition of $m$

$(p_1^{\pi_1}p_2^{\pi_2}p_3^{\pi_3}\dots)$ a partition of $n$.

Of the whole number of distributions of the $n$ objects, there will be a certain number such that $\pi_1$ parcels each contain $p_1$ objects, and in general $\pi_s$ parcels each contain $p_s$ objects where $s=1, 2, 3, \dots$. Consider the product $h_{p_1}^{\pi_1}h_{p_2}^{\pi_2}h_{p_3}^{\pi_3}\dots$ which can be permuted in $\frac{m!}{\pi_1!\pi_2!\pi_3!\dots}$ ways. For each of these ways $h_{p_1}^{\pi_1}h_{p_2}^{\pi_2}h_{p_3}^{\pi_3}$.. will be a distribution function for distributions of the specified type. Hence, regarding all the permutations, the distribution function is

$$\frac{m!}{\pi_1!\pi_2!\pi_3!\dots}h_{p_1}^{\pi_1}h_{p_2}^{\pi_2}h_{p_3}^{\pi_3}\dots$$

and regarding, as well, all the partitions of $n$ into exactly $m$ parts, the desired distribution function is

$$\Sigma\frac{m!}{\pi_1!\pi_2!\pi_3!\dots}h_{p_1}^{\pi_1}h_{p_2}^{\pi_2}h_{p_3}^{\pi_3}\dots \qquad [\Sigma\pi=m,\ \Sigma\pi p=n],$$

that is, it is the coefficient of $x^n$ in $(h_1x+h_2x^2+h_3x^3+\dots)^m$. The value of $A_{(p_1^{\pi_1}p_2^{\pi_2}p_3^{\pi_3}\dots),\ (1^m)}$ is the coefficient of $(p_1^{\pi_1}p_2^{\pi_2}p_3^{\pi_3}\dots)x^n$ in the development of the above expression, and is easily shown to have the value

$$\binom{p_1+m-1}{p_1}^{\pi_1}\binom{p_2+m-1}{p_2}^{\pi_2}\binom{p_3+m-1}{p_3}^{\pi_3}\dots$$
$$-\binom{m}{1}\binom{p_1+m-2}{p_1}^{\pi_1}\binom{p_2+m-2}{p_2}^{\pi_2}\binom{p_3+m-2}{p_3}^{\pi_3}\dots$$
$$+\binom{m}{2}\binom{p_1+m-3}{p_1}^{\pi_1}\binom{p_2+m-3}{p_2}^{\pi_2}\binom{p_3+m-3}{p_3}^{\pi_3}\dots$$
$$-\ \dots \text{to } m \text{ terms.}$$

Observe that when $p_1=p_2=p_3=\dots=\pi_1=\pi_2=\pi_3=\dots=1$ this expression reduces to the $m$th divided difference of $0^n$. The expression gives the compositions of the multipartite number $\overline{p_1^{\pi_1}p_2^{\pi_2}p_3^{\pi_3}\dots}$ into $m$ parts. Summing the distribution function from $m=1$ to $m=\infty$ and putting $x=1$, as we may without detriment, we find that the totality of the compositions is given by $\frac{h_1+h_2+h_3+\dots}{1-h_1-h_2-h_3-\dots}$ which may be given the form $\frac{a_1-a_2+a_3-\dots}{1-2(a_1-a_2+a_3-\dots)}$. Adding $\frac{1}{2}$ we bring this to the still more convenient form

$$\frac{1}{2}\frac{1}{1-2(a_1-a_2+a_3-\dots)}.$$

Let $F(p_1^{\pi_1}p_2^{\pi_2}p_3^{\pi_3}\dots)$ denote the total number of compositions of the multipartite $\overline{p_1^{\pi_1}p_2^{\pi_2}p_3^{\pi_3}\dots}$. Then $\frac{1}{2}\frac{1}{1-2a}=\frac{1}{2}+\Sigma F(p)a^p$, and thence $F(p)=2^{p-1}$. Again $\frac{1}{2}\frac{1}{1-2(a+\beta-a\beta)}=\frac{1}{2}+\Sigma F(p_1p_2)a^{p_1}\beta^{p_2}$, and expanding the left-hand side we easily find

$$F(p_1p_2)=2^{p_1+p_2-1}\frac{(p_1+p_2)!}{0!\,p_1!\,p_2!}-2^{p_1+p_2-2}\frac{(p_1+p_2-1)!}{1!\,(p_1-1)!\,(p_2-1)!}$$
$$+2^{p_1+p_2-3}\frac{(p_1+p_2-2)!}{2!\,(p_1-2)!\,(p_2-2)!}-\dots.$$

We have found that the number of compositions of the multipartite $\overline{p_1p_2p_3\dots p_s}$ is equal to the coefficient of symmetric function $(p_1p_2p_3\dots p_s)$ *or* of the single term $a_1^{p_1}a_2^{p_2}a_3^{p_3}\dots a_s^{p_s}$ in the development according to ascending powers of the algebraic fraction

$$\frac{1}{2}\cdot\frac{1}{1-2(\Sigma a_1-\Sigma a_1a_2+\Sigma a_1a_2a_3-\dots+(-)^{s+1}a_1a_2a_3\dots a_s}.$$

This result can be thrown into another suggestive form, for it can be proved that that portion of the expanded fraction

$$\frac{1}{2}\cdot\frac{1}{\{1-t_1(2a_1+a_2+\dots+a_s)\}\{1-t_2(2a_1+2a_2+\dots+a_s)\}\dots\{1-t_s(2a_1+2a_2+\dots+2a_s)\}},$$

which is composed entirely of powers of

$$t_1a_1,\ t_2a_2,\ t_3a_3,\ \dots\ t_sa_s$$

has the expression

$$\frac{1}{2}\cdot\frac{1}{1-2(\Sigma t_1a_1-\Sigma t_1t_2a_1a_2+\Sigma t_1t_2t_3a_1a_2a_3-\dots+(-)^{s+1}t_1t_2\dots t_sa_1a_2\dots a_s)},$$

and therefore the coefficient of $a_1^{p_1}a_2^{p_1}\dots a_s^{p_s}$ in the latter fraction, when $t_1$, $t_2$, &c., are put equal to unity, is equal to the coefficient of the same term in the product

$$\frac{1}{2}(2a_1+a_2+\dots+a_s)^{p_1}(2a_1+2a_2+\dots+a_s)^{p_2}\dots(2a_1+2a_2+\dots+2a_s)^{p_s}.$$

This result gives a direct connexion between the number of compositions and the permutations of the letters in the product $a_1^{p_1}a_2^{p_2}\dots a_s^{p_s}$. Selecting any permutation, suppose that the letter $a_r$ occurs $q_r$ times in the last $p_r+p_{r+1}+\dots+p_s$ places of the permutation; the coefficient in question may be represented by $\frac{1}{2}\Sigma 2^{q_1+q_2+\dots+q_s}$, the summation being for every permutation, and since $q_1=p_1$ this may be written

$$2^{p_1-1}\Sigma 2^{q_2+q_3+\dots+q_s}.$$

*Ex. Gr.*—For the bipartite $\overline{22}$, $p_1=p_2=2$, and we have the following scheme:—

$$\begin{array}{cc|cc r}
a_1 & a_1 & a_2 & a_2 & q_2=2 \\
a_1 & a_2 & a_1 & a_2 & =1 \\
a_1 & a_2 & a_2 & a_1 & =1 \\
a_2 & a_1 & a_1 & a_2 & =1 \\
a_2 & a_1 & a_2 & a_1 & =1 \\
a_2 & a_2 & a_1 & a_1 & =0
\end{array}$$

Hence $F(22)=2(2^2+2+2+2+2+2^0)=26.$

We may regard the fraction

$$\frac{1}{\frac{1}{2}\cdot\{1-t_1(2a_1+a_2+\dots+a_s)\}\{1-t_2(2a_1+2a_2+\dots+a_s)\}\dots\{1-t_s(2a_1+2a_2+\dots+2a_s)\}}$$

as a redundant generating function, the enumeration of the compositions being given by the coefficient of

$$(t_1a_1)^{p_1}(t_2a_2)^{p_2}\dots(t_sa_s)^{p_s}.$$

The transformation of the pure generating function into a factorized redundant form supplies the key to the solution of a large number of questions in the theory of ordinary permutations, as will be seen later.

[The transformation of the last section involves a comprehensive theory of Permutations, which it is convenient to discuss shortly here. ***The Theory of Permutations.***

If $X_1, X_2, X_3, \dots X_n$ be linear functions given by the matricular relation

$$(X_1, X_2, \dots X_n)=\left(\begin{array}{cccc} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \cdot & \cdot & \dots & \cdot \\ \cdot & \cdot & \dots & \cdot \\ a_{n1} & a_{n2} & \dots & a_{nn}\end{array}\right)(x_1, x_2, \dots x_n)$$

that portion of the algebraic fraction,

$$\frac{1}{(1-s_1X_1)(1-s_2X_2)\dots(1-s_nX_n)},$$

which is a function of the products $s_1x_1, s_2x_2, s_3x_3 \dots s_nx_n$ only is

$$\frac{1}{|(1-a_{11}s_1x_1)(1-a_{22}s_2x_2)(1-a_{33}s_3x_3)\dots(1-a_{nn}s_nx_n)|}$$

where the denominator is in a symbolic form and denotes on expansion

$$1-\Sigma|a_{11}|s_1x_1+\Sigma|a_{11}a_{22}|s_1s_2x_1x_2-\dots+(-)^n|a_{11}a_{22}a_{33}\dots a_{nn}|s_1s_2\dots s_nx_1x_2\dots x_n,$$

where $|a_{11}|, |a_{11}a_{22}|, \dots |a_{11}a_{22}\dots a_{nn}|$ denote the several co-axial minors of the determinant

$$|a_{11}a_{22}\dots a_{nn}|$$

of the matrix. (For the proof of this theorem see MacMahon, "A certain Class of Generating Functions in the Theory of Numbers," *Phil. Trans. R. S.* vol. clxxxv. A, 1894). It follows that the coefficient of

$$x_1^{\xi_1}x_2^{\xi_2}\dots x_n^{\xi_n}$$

in the product

$$(a_{11}x_1+a_{12}x_2+\dots+a_{1n}x_n)^{\xi_1}(a_{21}x_1+a_{22}x_2+\dots+a_{2n}x_n)^{\xi_2}\dots(a_{n1}x_1+a_{n2}x_2+\dots+a_{nn}x_n)^{\xi_n}$$

is equal to the coefficient of the same term in the expansion ascending-wise of the fraction

$$\frac{1}{1-\Sigma|a_{11}|x_1+\Sigma|a_{11}a_{22}|x_1x_2-\dots+(-)^n|a_{11}a_{22}\dots a_{nn}|x_1x_2\dots x_n}.$$

If the elements of the determinant be all of them equal to unity, we obtain the functions which enumerate the unrestricted permutations of the letters in

$$x_1^{\xi_1}x_2^{\xi_2}\dots x_n^{\xi_n},$$

viz.,

$$(x_1+x_2+\dots+x_n)^{\xi_1+\xi_2+\dots+\xi_n}$$

and

$$\frac{1}{1-(x_1+x_2+\dots+x_n)}.$$

Suppose that we wish to find the generating function for the enumeration of those permutations of the letters in $x_1^{\xi_1}x_2^{\xi_2}\ldots x_n^{\xi_n}$ which are such that no letter $x_s$ is in a position originally occupied by an $x_s$ for all values of $s$. This is a generalization of the "Problème des rencontres" or of "derangements." We have merely to put

$$a_{11}=a_{22}=a_{33}=\ldots=a_{nn}=0$$

and the remaining elements equal to unity. The generating product is

$$(x_2+x_3+\ldots+x_n)^{\xi_1}(x_1+x_3+\ldots+x_n)^{\xi_2}\ldots(x_1+x_2+\ldots+x_{n-1})^{\xi_n},$$

and to obtain the condensed form we have to evaluate the co-axial minors of the invertebrate determinant—

$$\begin{vmatrix} 0 & 1 & 1 & \ldots & 1 \\ 1 & 0 & 1 & \ldots & 1 \\ 1 & 1 & 0 & \ldots & 1 \\ \cdot & \cdot & \cdot & \ldots & \cdot \\ 1 & 1 & 1 & \ldots & 0 \end{vmatrix}$$

The minors of the 1st, 2nd, 3rd ... $n$th orders have respectively the values

$$\begin{array}{c} 0 \\ -1 \\ +2 \\ \vdots \\ (-)^{n-1}(n-1), \end{array}$$

therefore the generating function is

$$\frac{1}{1-\Sigma x_1x_2-2\Sigma x_1x_2x_3-\ldots-s\Sigma x_1x_2\ldots x_{s+1}-\ldots-(n-1)x_1x_2\ldots x_n}$$

or writing

$$(x-x_1)(x-x_2)\ldots(x-x_n)=x^n-a_1x^{n-1}+a_2x^{n-2}-\ldots$$

this is

$$\frac{1}{1-a_2-2a_3-3a_4-\ldots-(n-1)a_n}$$

Again, consider the general problem of "derangements." We have to find the number of permutations such that exactly $m$ of the letters are in places they originally occupied. We have the particular redundant product

$$(ax_1+x_2+\ldots+x_n)^{\xi_1}(x_1+ax_2+\ldots+x_n)^{\xi_2}\ldots(x_1+x_2+\ldots+ax_n)^{\xi_n},$$

in which the sought number is the coefficient of $a^m x_1^{\xi_1}x_2^{\xi_2}\ldots x_n^{\xi_n}$. The true generating function is derived from the determinant

$$\begin{vmatrix} a & 1 & 1 & 1 & . & . & . \\ 1 & a & 1 & 1 & . & . & . \\ 1 & 1 & a & 1 & . & . & . \\ 1 & 1 & 1 & a & . & . & . \\ . & . & . & . & & & \\ . & . & . & . & & & \end{vmatrix}$$

and has the form

$$\frac{1}{1-a\Sigma x_1+(a-1)(a+1)\Sigma x_1x_2-\ldots+(-)^n(a-1)^{n-1}(a+n-1)x_1x_2\ldots x_n}.$$

It is clear that a large class of problems in permutations can be solved in a similar manner, viz., by giving special values to the elements of the determinant of the matrix. The redundant product leads uniquely to the real generating function, but the latter has generally more than one representation as a redundant product, in the cases in which it is representable at all. For the existence of a redundant form, the coefficients of $x_1$, $x_2$, ... $x_1x_2$, ... in the denominator of the real generating function must satisfy $2^n-n^2+n-2$ conditions, and assuming this to be the case, a redundant form can be constructed which involves $n-1$ undetermined quantities. We are thus able to pass from any particular redundant generating function to one equivalent to it, but involving $n-1$ undetermined quantities. Assuming these quantities at pleasure we obtain a number of different algebraic products, each of which may have its own meaning in arithmetic, and thus the number of arithmetical correspondences obtainable is subject to no finite limit (cf. MacMahon, *loc. cit.*, pp. 125 *et seq.*)]

3. *The Theory of Partitions. Parcels defined by* (m).—When an **Case III.** ordinary unipartite number $n$ is broken up into other numbers, and the order of occurrence of the numbers is immaterial, the collection of numbers is termed a partition of the number $n$. It is usual to arrange the numbers comprised in the collection, termed the parts of the partition, in descending order of magnitude, and to indicate repetitions of the same part by the use of exponents. Thus (32111), a partition of 8, is written ($321^3$). Euler's pioneering work in the subject rests on the observation that the algebraic multiplication

$$x^a\times x^b\times x^c\times\ldots=x^{a+b+c+}\ldots$$

is equivalent to the arithmetical addition of the exponents $a$, $b$, $c$, ... He showed that the number of ways of composing $n$ with $p$ integers drawn from the series $a$, $b$, $c$, ..., repeated or not, is equal to the coefficient of $\zeta^p x^n$ in the ascending expansion of the fraction

$$\frac{1}{1-\zeta x^a\,.\,1-\zeta x^b\,.\,1-\zeta x^c\,.\,\ldots},$$

which he termed the generating function of the partitions in question.

If the partitions are to be composed of $p$, or fewer parts, it is merely necessary to multiply this fraction by $\frac{1}{1-\zeta}$. Similarly, if the parts are to be unrepeated, the generating function is the algebraic product

$$(1+\zeta x^a)(1+\zeta x^b)(1+\zeta x^c)\ldots,$$

if each part may occur at most twice,

$$(1+\zeta x^a+\zeta^2x^{2a})(1+\zeta x^b+\zeta^2x^{2b})(1+\zeta x^c+\zeta^2x^{2c})\ldots,$$

and generally if each part may occur at most $k-1$ times it is

$$\frac{1-\zeta^kx^{ka}}{1-\zeta x^a}\cdot\frac{1-\zeta^kx^{kb}}{1-\zeta x^b}\cdot\frac{1-\zeta^kx^{kc}}{1-\zeta x^c}\cdot\ldots$$

It is thus easy to form generating functions for the partitions of numbers into parts subject to various restrictions. If there be no restriction in regard to the numbers of the parts, the generating function is

$$\frac{1}{1-x^a\,.\,1-x^b\,.\,1-x^c\,.\,\ldots}$$

and the problems of finding the partitions of a number $n$, and of determining their number, are the same as those of solving and enumerating the solutions of the indeterminate equation in positive integers

$$ax+by+cz+\ldots=n.$$

Euler considered also the question of enumerating the solutions of the indeterminate simultaneous equation in positive integers

$$\begin{array}{l} ax+by+cz+\ldots=n \\ a'x+b'y+c'z+\ldots=n' \\ a''x+b''y+c''z+\ldots=n'' \\ \cdot\quad\cdot\quad\cdot\quad\cdot \end{array}$$

which was called by him and those of his time the "Problem of the Virgins." The enumeration is given by the coefficient of $x^ny^{n'}z^{n''}\ldots$ in the expansion of the fraction

$$\frac{1}{(1-x^ay^bz^c\ldots)(1-x^{a'}y^{b'}z^{c'}\ldots)(1-x^{a''}y^{b''}z^{c''}\ldots)\ldots}$$

which enumerates the partitions of the multipartite number $\overline{nn'n''\ldots}$ into the parts

$$\overline{abc\ldots},\ \overline{a'b'c'\ldots},\ \overline{a''b''c''}\ldots\ldots$$

Sylvester has determined an analytical expression for the coefficient of $x^n$ in the expansion of

$$\frac{1}{(1-x^a)(1-x^b)\ldots(1-x^l)}.$$

To explain this we have two lemmas:—

*Lemma* 1.—The coefficient of $\frac{1}{x}$, *i.e.*, after Cauchy, the residue in the ascending expansion of $(1-e^x)^{-i}$ is $-1$. For when $i$ is unity, it is obviously the case, and

$$\begin{aligned}(1-e^x)^{-i-1}&=(1-e^x)^{-i}+e^x(1-e^x)^{-i-1}\\&=(1-e^x)^{-i}+\frac{d}{dx}(1-e^x)^{-i}\,.\,\frac{1}{i}.\end{aligned}$$

Here the residue of $\frac{d}{dx}(1-e^x)^{-i}\frac{1}{i}$ is zero, and therefore the residue of $(1-e^x)^{-i}$, is unchanged when $i$ is increased by unity, and is, therefore, always $-1$ for all values of $i$.

*Lemma* 2.—The constant term in any proper algebraical fraction developed in ascending powers of its variable is the same as the residue, with changed sign, of the sum of the fractions obtained by substituting in the given fraction, in lieu of the variable, its exponential multiplied in succession by each of its values (zero excepted, if there be such), which makes the given fraction infinite. For write the proper algebraical fraction

$$Fx=\Sigma\Sigma\frac{c_{\lambda,\mu}}{(a_\mu-x)^\lambda}+\Sigma\frac{\gamma_\lambda}{x^\lambda}.$$

The constant term is $\Sigma\Sigma \dfrac{c_{\lambda,\mu}}{\alpha_\mu^\lambda}$.

Let $\alpha_\nu$ be a value of $x$ which makes the fraction infinite. The residue of

$$\Sigma\Sigma\Sigma \frac{c_{\lambda,\mu}}{(\alpha_\mu - \alpha_\nu e^x)^\lambda} + \Sigma \frac{\gamma_\lambda}{\alpha_\nu^\lambda e^{\lambda x}}$$

is equal to the residue of

$$\Sigma\Sigma\Sigma \frac{c_{\lambda,\mu}}{(\alpha_\mu - \alpha_\nu e^x)^\lambda},$$

and when $\nu = \mu$, the residue vanishes so that we have to consider

$$\Sigma\Sigma \frac{c_{\lambda,\mu}}{\alpha_\mu^\lambda (1-e^x)^\lambda},$$

and the residue of this is, by the first lemma,

$$-\Sigma\Sigma \frac{c_{\lambda,\mu}}{\alpha_\mu^\lambda},$$

which proves the lemma.

Take $Fx = \dfrac{1}{x^n(1-x^a)(1-x^b)\dots(1-x^l)} = \dfrac{fx}{x^n}$, since the sought number is its constant term.

Let $\rho$ be a root of unity which makes $fx$ infinite when substituted for $x$. The function of which we have to take the residue is

$$\Sigma \rho^{-n} e^{nx} f(\rho e^{-x})$$

$$= \Sigma \frac{\rho^{-n} e^{nx}}{(1-\rho^a e^{-ax})(1-\rho^b e^{-bx})\dots(1-\rho^l e^{-lx})}.$$

We may divide the calculation up into sections by considering separately that portion of the summation which involves the primitive $q$th roots of unity, $q$ being a divisor of one of the numbers $a, b, \dots l$. Thus the $q$th *wave* is

$$\Sigma \frac{\rho_q^{-n} e^{nx}}{(1-\rho_q^a e^{-ax})(1-\rho_q^b e^{-bx})\dots(1-\rho_q^l e^{-lx})}$$

which, putting $\dfrac{1}{\rho_q}$ for $\rho_q$ and $\nu = n + \frac{1}{2}(a+b+\dots+l)$, may be written

$$\Sigma \frac{\rho_q^\nu e^{\nu x}}{\left(\rho_q^{\frac{1}{2}a} e^{\frac{1}{2}ax} - \rho_q^{-\frac{1}{2}a} e^{-\frac{1}{2}ax}\right)\left(\rho_q^{\frac{1}{2}b} e^{\frac{1}{2}bx} - \rho_q^{-\frac{1}{2}b} e^{-\frac{1}{2}bx}\right)\dots\left(\rho_q^{\frac{1}{2}l} e^{\frac{1}{2}lx} - \rho_q^{-\frac{1}{2}l} e^{-\frac{1}{2}lx}\right)},$$

and the calculation in simple cases is practicable.

Thus Sylvester finds for the coefficient of $x^n$ in

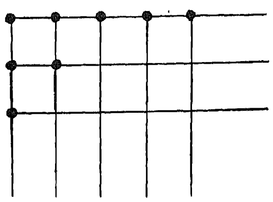
$$\frac{1}{1-x \,.\, 1-x^2 \,.\, 1-x^3}$$

the expression $\quad \dfrac{\nu^2}{12} - \dfrac{7}{72} - \dfrac{1}{8}(-)^\nu + \dfrac{1}{9}(\rho_3^\nu + \rho_3^{-\nu})$

where $\nu = n + 3$.

**Sylvester's graphical Method.**

Sylvester, Franklin, Durfee, Ely, and others, have evolved a Constructive Theory of Partitions, the object of which is the contemplation of the partitions themselves, and the evolution of their properties from a study of their inherent characters. It is concerned for the most part with the partition of a number into parts drawn from the natural series of numbers 1, 2, 3 .... Any partition, say (521) of the number 8, is represented by nodes placed in order at the points of a rectangular lattice,



when the partition is given by the enumeration of the nodes by lines. If we enumerate by columns we obtain another partition of 8, viz., $(321^3)$, which is termed the conjugate of the former. The fact of conjugacy was first pointed out by Ferrers. If the original partition is one of a number $n$ in $i$ parts, of which the largest is $j$, the conjugate is one into $j$ parts, of which the largest is $i$, and we obtain the theorem:—"The number of partitions of any number into $\begin{matrix}i \text{ parts} \\ i \text{ parts or fewer}\end{matrix}$ and having the largest part $\begin{matrix}\text{equal to } j \\ \text{equal or less than } j,\end{matrix}$ remains the same when the numbers $i$ and $j$ are interchanged."

The study of this representation on a lattice (termed by Sylvester the "graph") yields many theorems similar to that just given, and, moreover, throws considerable light upon the expansion of algebraic series.

The theorem of reciprocity just established shows that the number of partitions of $n$ into $j$ parts or fewer, is the same as the number of ways of composing $n$ with the integers 1, 2, 3, .. $j$. Hence we can expand $\dfrac{1}{1-a \,.\, 1-ax \,.\, 1-ax^2 \,.\, 1-ax^3 \dots \textit{ad inf.}}$ in ascending powers of $a$; for the coefficient of $a^j x^n$ in the expansion is the number of ways of composing $n$ with $j$ or fewer parts, and this we have seen in the coefficients of $x^n$ in the ascending expansion of $\dfrac{1}{1-x \,.\, 1-x^2 \dots 1-x^j}$. Therefore

$$\frac{1}{1-a \,.\, 1-ax \,.\, 1-ax^2 \dots} = 1 + \frac{a}{1-x} + \frac{a^2}{1-x \,.\, 1-x^2} + \dots$$
$$+ \frac{a^j}{1-x \,.\, 1-x^2 \dots 1-x^j} + \dots$$

The coefficient of $a^j x^n$ in the expansion of

$$\frac{1}{1-a \,.\, 1-ax \,.\, 1-ax^2 \,.\dots 1-ax^i}$$

denotes the number of ways of composing $n$ with $j$ or fewer parts, none of which are greater than $i$. The expansion is known to be

$$\Sigma \frac{1-x^{j+1} \,.\, 1-x^{j+2} \dots 1-x^{j+i}}{1-x \,.\, 1-x^2 \dots 1-x^i} a^j.$$

It has been established by the constructive method by F. Franklin (*Amer. Jour. of Math.* vol. v. p. 254), and shows that the generating function for the partitions in question is

$$\frac{1-x^{j+1} \,.\, 1-x^{j+2} \dots 1-x^{j+i}}{1-x \,.\, 1-x^2 \dots 1-x^i},$$

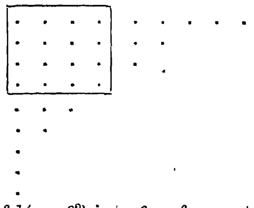
which, observe, is unaltered by interchange of $i$ and $j$.

Franklin has also similarly established the identity of Euler—

$$(1-x)(1-x^2)(1-x^3)\dots \textit{ad inf.} = \sum_{j=+\infty}^{j=-\infty} (-)^j x^{\frac{1}{2}(3j^2+j)},$$

known as the "pentagonal number theorem," which on interpretation shows that the number of ways of partitioning $n$ into an even number of unrepeated parts is equal to that into an uneven number, except when $n$ has the pentagonal form $\frac{1}{2}(3j^2+j)$, $j$ positive or negative, when the difference between the numbers of the partitions is $(-)^j$.

To illustrate an important dissection of the graph we will consider those graphs which read the same by columns as by lines; these are called self-conjugate. Such a graph may be obviously dissected into a square, containing say $\theta^2$ nodes, and into two graphs, one lateral and one subjacent, the latter being the conjugate of the former. The former graph is limited to contain not more than $\theta$ parts, but is subject to no other condition. Hence the number of self-conjugate partitions of $n$ which are associated with a square of $\theta^2$ nodes, is clearly equal to the number of partitions of $\frac{1}{2}(n-\theta^2)$ into $\theta$ or few parts, *i.e.*, it is the coefficient of $x^{\frac{1}{2}(n-\theta^2)}$ in



$$\frac{1}{1-x \,.\, 1-x^2 \,.\, 1-x^3 \dots 1-x^\theta},$$

or of $x^n$ in $\quad \dfrac{x^{\theta^2}}{1-x^2 \,.\, 1-x^4 \,.\, 1-x^6 \dots 1-x^{2\theta}},$

and the whole generating function is

$$1 + \sum_{\theta=1}^{\theta=\infty} \frac{x^{\theta^2}}{1-x^2 \,.\, 1-x^4 \,.\, 1-x^6 \dots 1-x^{2\theta}}.$$

Now the graph is also composed of $\theta$ angles of nodes, each angle containing an uneven number of nodes; hence the partition is transformable into one containing $\theta$ unequal uneven numbers. In the case depicted this partition is (17, 9, 5, 1). Hence the number of the partitions based upon a square of $\theta^2$ nodes is the coefficient

coverer is often added as 1895 C (Perrine). Comets are definitely designated as 1899 I., 1899 II., 1899 III., &c., the numerals I., II., III., &c., indicating the order in which the various comets of the year pass their perihelion points (comet 1895 C = comet 1895 IV.). Periodic comets are also often called by the name of their discoverers, as Winnecke's comet (= 1892 IV., or 1886 VI.); or, again, the name of the first discoverer is sometimes replaced by the name of an astronomer who has made extended calculations upon the comet's orbit. Comet 1819 IV. is no longer Pons's comet, but Encke's, for this reason.

In the following table the first column contains a current number for reference; the second, the date A.D. (new style after 1580), in Paris mean time, and the number of the comet in its year, as I., II., &c.; the third, the argument of perihelion or, $\pi - \Omega$, where $\pi$ = longitude of perihelion; the fourth, longitude of the ascending node of the comet's orbit, $\Omega$; the fifth, the inclination of the orbit; the sixth, the perihelion distance of the comet in terms of the earth's mean distance = 1·000; the seventh, the comet's semi-major axis; the eighth, the periodic time in years; the ninth, the eccentricity; and the tenth, the name by which the comet is commonly known. The data in this form record every appearance of known periodic comets, whose periods are less than one hundred years. The data for Nos. 1–111 are from Winlock's Tables in *Publ. Ast. Soc. Pac.* vol. viii. p. 141; the data for Nos. 112–122 have been furnished by C. D. Perrine.

*Table of the Approximate Elements at each Return of all known Periodic Comets whose Periods are less than One Hundred Years.*

| No. | Time of Perihelion Passage. T. | $\pi - \Omega$ $\omega$ | Longitude Ascending Node. $\Omega$ | Inclination. $i$ | Perihelion Distance. $q$ | Semi-Major Axis. $a$ | Period. $U$ | Eccentricity. $e$ | Comet of |

During the decade 1890-1900 our knowledge of cometic orbits was greatly increased by a systematic effort to provide computers for the orbits of comets whose elements require revision. Reports on this matter are printed by Dr Kreutz, at intervals, in the *V. J. S.* of the *Astronomische Gesellschaft*. All the computations relating to periodic comets are in thoroughly competent hands. The orbit of Wolf's comet, for example, is so well determined by its calculator (Pastor Thraen) that at its last return observation agreed with computation exactly within the limits of accuracy set by five-place logarithms. The non-periodic comets appearing since 1700 are nearly all in the hands of computers; only nineteen comets of the 18th and twenty-eight of the 19th century were unassigned at the date of Dr Kreutz's report in 1898.

The most important periodic comets are given in the following table :—

| Name | Period in years | Remarks. |
|---|---|---|
| Encke . . . | 3·303 | Regularly returning since 1786, last observed in 1901. Its brightness in 1891 was about the same as in 1858. Sudden changes of brilliancy were observed at some of its returns (1865 and 1898 for example). Computers—Backlund, Ivanow. |
| Tempel (II) . . | 5·218 | Last observed 1899. Computer—Schulhoff. |
| Barnard . . | 5·400 | Last observed 1884. |
| Brorsen . . | 5·456 | Last observed 1879. See the remarks under Denning's comet below. |
| Tempel - L. Swift . | 5·534 | Last observed 1891. Computer—Bossert. |
| Winnecke . . | 5·818 | Last observed 1898. Computers Von Haerdtl and Hillebrand. |
| De Vico - E. Swift | 5·863 | Last observed 1894. It is the comet 1844 I. (De Vico). Computer—Chandler. |
| Brooks . . . | 5·595 | Last observed 1886. |
| Tempel (I.) . . | 5·98 | Observed in 1867, 1873, and 1879; subject to large perturbations by Jupiter 1879–85, and not since seen. Computer—Gautier. |
| Barnard . . | 6·226 | Last observed 1892. Computer—Coniel. |
| Spitaler . . | 6·402 | Last observed 1890. Computer—Spitaler. |
| Perrine . . | 6·441 | Discovered 1896. Computers—Ristenpart, Hadley. |
| Giacobini . . | 6·549 | Discovered 1896. |
| Biela (I. and II.) . | 6·6 | Discovered 1772; seen 1805, 1826, and 1832. In 1846 it divided into two parts, which were widely separated at its return of 1852. It has not since been observed. |
| Finlay . . . | 6·622 | Last observed 1893 (second return). Computer—Schulhoff. |
| D'Arrest . . | 6·691 | Observed in 1851, 1857, 1870, 1877, 1890, 1897. Computer—Leveau. |
| Wolf . . . | 6·821 | Regularly returning; last observed 1898. Computer—Thraen. |
| Giacobini . . | 6·86 | Last observed 1896. Its orbit somewhat resembles that of comet Faye. Computer—Pokrowsky. |
| Holmes . . | 6·904 | Last observed 1899 within its calculated place by 28 s. in R. A., 5′ in Dec. Its calculated period required a correction of 0·3 of a day only. This comet was, in 1892, subject to changes of brightness suggesting internal changes. The question arises why so bright a comet was not earlier discovered. Its orbit is more nearly circular than that of any other comet, and lies wholly between the orbits of Mars and Jupiter, in the region of asteroids therefore. Its spectrum shows only a trace of one bright line. Computer—Zwiers. |
| Swift . . . | 7·059 | Last observed 1895. It is not unlikely to be a return of Lexell's comet of 1770. |
| Brooks . . . | 7·097 | Last observed 1896. Its spectrum was continuous. It was at first supposed to be a return of Lexell's comet, but the researches of Dr C. L. Poor make the identity unlikely. |
| Denning (II) . | 7·42 | Last observed 1894. Its orbit lies within 0·16 of Jupiter's orbit, and near that point crosses the orbit of Brorsen's comet. The two comets were near the point of intersection in 1881 (though Jupiter was not then near) which *may* account for the disappearance of Brorsen's comet since its return in 1879. |
| Faye . . . | 7·566 | Last observed 1896. |
| Swift . . . | 8·534 | Last observed 1889. Computer—Coniel. |
| Denning (I.) . | 8·867 | Last observed 1881. |
| Tuttle . . . | 13·76 | Last observed 1899. Computer—Rahts. |
| Tempel . . . | 33·18 | Last observed 1866. |
| Stephan . . | 40·09 | Last observed 1867. |
| Westphal . . | 60·7 | Last observed 1852. |
| Pons-Brooks . . | 71·48 | Observed in 1812 and 1884. |
| Olbers . . | 72·63 | Observed in 1815 and 1887. |
| De Vico . . | 75·7 | Last observed 1846. |
| Halley . . . | 76·37 | Regularly returning. The next appearance is 1910. |

In the course of the ten years 1890–99 thirty-seven unexpected comets were discovered (four on photographic plates, the others after search with visual telescopes) besides a number of expected (periodic) comets. During the years 1782 to 1841 eighty-seven comets of both classes were observed, or 1·45 per year, while from 1842 to 1897 there were 241 comets, or 4·30 per year. The difference in the average numbers probably represents nothing more than the increased attention paid to cometary discovery in late years. For example, ten comets were discovered during 1898, three of them being known periodic comets. In the year 1840 a gold medal was founded by Christian VIII., king of Denmark, to be given to discoverers of telescopic comets, but after his death the award was discontinued. The comet medal (bronze) of the Astronomical Society of the Pacific was founded by Hon. Joseph A. Donohoe in the year 1890, and is presented to the discoverer of every unexpected comet on the report of a committee of the society. A list of the awards constitutes, therefore, a history of recent cometary discoveries.

*List of Unexpected Comets discovered since 1st January 1890.*

A few of the remarkable comets of the years 1888–1900 are here briefly described. Comet 1888 I. exhibited peculiar variations in its head like those which distinguished the comets 1882 II. and 1884 I. Two (or according to one observer three) nuclei were enclosed in a nebulous sheath, as in 1882 II. On 21st May, two months after perihelion passage, the head suddenly became about two stellar magnitudes brighter, and two jets were ejected from it, both much brighter than the main

[1] This is the first comet discovered by photography.
[2] This comet was discovered on the photographs of the total solar eclipse taken by the Lick Observatory eclipse expedition to Chile.
[3] Discovered by photography.
[4] The orbit of this comet resembles that of Schaeberle's comet of 1881.
[5] Discovered by photography.

tail. The causes of such changes must be sought for within the comet as, in all likelihood, they were not the direct result of solar action. Several other comets have shown like variations. Comet 1889 I. is remarkable for the long period (971 days) during which it was under observation. It was observed at four oppositions to the sun, the last observation being 1st May 1891. At this time its distance from the earth was 7·40; from the sun, 8·22, which is not very different from the distance of Saturn = 9·54. The bright comet of 1811 was not observed beyond 4·53 from the sun, and the great comet of 1882 was lost at 5·16. Comet 1892 I. was photographed at various observatories, and the photographs show that its tail was of a very complex character and subject to great variations. W. H. Pickering (*Annals H. C. O.* vol. xxxii.) concludes that the variations were periodic, and that the whole comet rotated in a period of about four days on an axis through the head, coinciding with the general direction of the tail. The motion of condensations in the tail led him to the conclusion that the total repulsive force of the sun was 39·51 times the force of gravity. Professor Campbell, at the Lick Observatory, notes a diminution in the wave-length of the green band of the spectrum after perihelion passage. The changes in Holmes's periodic comet of 1892 have already been referred to. The periodic comet 1889 V. (Brooks) was discovered on 6th July. It passed perihelion on 30th September. On 1st August Professor Barnard, at the Lick Observatory, discovered two companion comets near by, and later two more. It has been suggested that the companion comets were separated from the main body by the attraction of Jupiter about May 1886, when the comet and planet were in proximity. The periodic comet (Tempel-Swift) came within 0·13 of Jupiter in 1880 (earth's distance from the sun = 1), and it is worthy of remark that at its return in 1891 it was reported by some observers to have a companion comet. Comet 1892 V. was the first one (except the eclipse comet of 1882) to be discovered by photography (by Professor Barnard at the Lick Observatory). The first comets photographed were those of 1881 (H. Draper); 1881 (Janssen); 1882 (Gill). All comets sufficiently bright are now studied to great advantage by photography. The next bright comet that is favourably situated will yield important discoveries, which are foreshadowed by the results of Professor Hussey of the Lick Observatory on the bright comet 1893 II. (see *Publications of the Astronomical Society of the Pacific*, vol. vii., 1895, pp. 161–185). Professor Hussey's photographs show marked changes in the nucleus, coma, and tail. The comet sent off a series of condensations or nebulous masses whose motions were determined to be between 40 and 60 miles per second. The photographs obtained by Professor Barnard of the Lick Observatory of the comet 1893 IV. also show extraordinary variations in the quantity of matter ejected by the head to form the tail, and in the direction of its motion (see *Knowledge*, February and May 1894). (E. S. H.)

**Comilla,** or Kumilla, a town of British India, headquarters of Tippera district in Bengal, situated on the river Gumti, with a station on the Assam-Bengal Railway, 96 miles from the coast terminus at Chittagong. Population (1881), 13,372; (1891), 14,680. The town has many large tanks; an English church, built in 1875; a high school; the Elliott artisan school; four printing-presses, one of which issues a vernacular newspaper; and a public library.

**Comiso,** a town of the province of Syracuse, Sicily, Italy, 90 miles by rail west by south from Syracuse, on the line to Licata. It has a fine spring, the fabled "bath of Diana," and limestone quarries. The people make pottery. Population, 19,333.

**Commentry,** a town of France, in the arrondissement of Montluçon, department of Allier, 42 miles south-west of Moulins by rail. It gives its name to a coal-field, the output of which in 1899 amounted to 778,417 tons (metric); over 4000 persons are employed in connexion with the mines. There are very important foundries and forges. Population (1881), 9394; (1896), 9197; (1901), 11,165.

**Commercial Treaties.**—A commercial treaty is a contract between States relative to trade. It is a bilateral act whereby definite arrangements are entered into by each contracting party towards the other—not mere concessions. As regards technical distinctions, an "agreement," an "exchange of notes," or a "convention" properly applies to one specific subject; whereas a "treaty" usually comprises several matters, whether commercial or political.

In ancient times foreign intercourse, trade, and navigation were in many instances regulated by international arrangements. The text is extant of treaties of commerce and navigation concluded between Carthage and Rome in 509 and 348 B.C. Aristotle mentions that nations were connected by commercial treaties; and other classical writers advert to these engagements. Under the Roman Empire the matters thus dealt with became regulated by law, or by usages sometimes styled laws. When the territories of the empire were contracted, and the imperial authority was weakened, some kind of international agreements again became necessary. At Constantinople in the 10th century treaties cited by Gibbon protected "the person, effects, and privileges of the Russian merchant"; and, in Western Europe, intercourse, trade, and navigation were carried on, at first tacitly by usage derived from Roman times, or under verbal permission given to merchants by the ruler to whose court they resorted. Afterwards, security in these transactions was afforded by means of formal documents, such as royal letters, charters, laws, and other instruments possessing the force of Government measures. Instances affecting English commercial relations are the letter of Charlemagne in 796, the Brabant Charter of 1305, and the Russian Ukase of 1569. Mediæval treaties of truce or peace often contained a clause permitting in general terms the renewal of personal and commercial communication as it subsisted before the war. This custom is still followed. But these mediæval arrangements were precarious: they were often of temporary duration, and were usually only effective during the lifetime of the contracting sovereigns.

Passing over trade agreements affecting the Eastern Empire, the modern commercial treaty system came into existence in the 12th century. Genoa, Pisa, and Venice were then well organized communities, and were in keen rivalry. Whenever their position in a foreign country was strong, a trading centre was established, and few or no specific engagements were made on their part. But in serious competition or difficulty another course was adopted: a formal agreement was concluded for the better security of their commerce and navigation. The arrangements of 1140 between Venice and Sicily; the Genoese conventions of 1149 with Valencia, of 1161 with Morocco, and of 1181 with the Balearic Islands; the Pisan conventions of 1173 with Sultan Saladin, and of 1184 with the Balearic Islands, were the earliest Western commercial treaties. Such definite arrangements, although still of a personal character, were soon perceived to be preferable to general provisions in a treaty of truce or peace. They afforded also greater security than privileges enjoyed under usage; or under grants of various kinds, whether local or royal. The policy thus inaugurated was adopted gradually throughout Europe. The first treaties relative to the trade of the Netherlands were between Brabant and Holland in 1203, Holland and Utrecht in 1204, and Brabant and Cologne in 1251. Early northern commercial treaties are those between Riga and Smolensk 1229, and between Lübeck and Sweden 1269. The first commercial relations between the Hanse Towns and foreign countries were arrangements made by guilds of merchants, not by public authorities as a governing body. For a long period the treaty system did not entirely supersede conditions of intercourse between nations dependent on permission.

The earliest English Commercial Treaty is that with Norway in 1217. It provides "ut mercatores et homines qui sunt de potestate vestra liberè et sine impedimento terram nostram adire possint, et homines et mercatores nostri similiter vestram." These stipulations are in due treaty form. The next early English treaties are —with Flanders, 1274 and 1314; Portugal, 1308, 1352, and 1386; Baltic Cities, 1319 and 1388; Biscay and Castile, 1351; Burgundy,

1417 and 1496; France, 1471, 1497, and 1510; Florence, 1490. The commercial treaty policy in England was carried out systematically under Henry IV. and Henry VII. It was continued under James I. to extend to Scotland English trading privileges. The results attained in the 17th century were—regularity in treaty arrangements; their durable instead of personal nature; the conversion of permissive into perfect rights; questions as to contraband and neutral trade stated in definite terms. Treaties were at first limited to exclusive and distinct engagements between the contracting States; each treaty differing more or less in its terms from other similar compacts. Afterwards by extending to a third nation privileges granted to particular countries, the *most favoured nation article* began to be framed. Cromwell continued the commercial treaty policy in order to obtain a formal recognition of the Commonwealth from foreign Powers. His treaty of 1654 with Sweden contains the first reciprocal English most favoured nation clause. Article IV. provides that the people, subjects, and inhabitants of either confederate "shall have and possess in the countries, lands, dominions, and kingdoms of the other as full and ample privileges, and as many exemptions, immunities, and liberties, as any foreigner doth or shall possess in the dominions and kingdoms of the said confederate." The Government of the Restoration replaced and enlarged the Protectorate arrangements by fresh agreements. The general policy of the Commonwealth was maintained, with further provisions on behalf of Colonial Trade. In the new treaty of 1661 with Sweden, the privileges secured were those which "any foreigner whatsoever doth or shall enjoy in the said dominions and kingdoms on both sides."

In contemporary treaties France obtained from Spain (1659) that French subjects should enjoy the same liberties as had been granted to the English; and England obtained from Denmark (1661) that the English should not pay more or greater customs than the people of the United Provinces and other foreigners, the Swedes only excepted. The colonial and navigation policy of the 17th century, and the proceedings of Louis XIV., provoked animosities and retaliatory tariffs. During the war of the Spanish Succession the Methuen Treaty of 1703 was concluded. Portugal removed prohibitions against the importation of British woollens; Great Britain engaged that Portuguese wines should pay one-third less duty than the rate levied on French wines. At the Peace of Utrecht in 1713 political and commercial treaties were concluded. England agreed to remove prohibitions on the importation of French goods, and to grant most favoured nation treatment in relation to goods and merchandise of the like nature from any other country in Europe; the French general tariff of September 18, 1664, was to be again put in force for English trade. The English provision was at variance with the Methuen Treaty. A violent controversy arose as to the relative importance in 1713 of Anglo-Portuguese or Anglo-French trade. In the end the House of Commons, by a majority of 9, rejected the Bill to give effect to the commercial treaty of 1713; and trade with France remained on an unsatisfactory footing until 1786. The other commercial treaties of Utrecht were very complete in their provisions, equal to those of the present time; and contained most favoured nation articles—England secured in 1715 reduction of duties on woollens imported into the Austrian Netherlands; and trading privileges in Spanish America. Moderate import duties for woollens were obtained in Russia by the Commercial treaty of 1766. In the meanwhile the Bourbon family compact of August 15, 1761, assured national treatment for the subjects of France, Spain, and the Two Sicilies, and for their trade in the European territories of the other two States; and most favoured nation treatment as regards any special terms granted to any foreign country. The first commercial treaties concluded by the United States with European countries contained most favoured nation clauses: this policy has been continued by the United States, but the wording of the clause has often varied.

In 1786 France began to effect tariff reform by means of commercial treaties. The first was with Great Britain, and it terminated the long-continued tariff warfare. But the wars of the French Revolution swept away these reforms, and brought about a renewal of hostile tariffs. Prohibitions and differential duties were renewed, and prevailed on the Continent until the sixth decade of the 19th century. In 1860 a Government existed in France sufficiently strong and liberal to revert to the policy of 1786. The bases of the Anglo-French treaty of 1860, beyond its most favoured nation provisions, were in France a general transition from prohibition or high customs duties to a moderate tariff; in the United Kingdom abandonment of all protective imposts, and reduction of duties maintained for fiscal purposes to the lowest rates compatible with these exigencies. Other European countries were obliged to obtain for their trade the benefit of the conventional tariff thus established in France, as an alternative to the high rates inscribed in the general tariff. A series of commercial treaties was accordingly concluded by different European States between 1861 and 1866, which effected further reductions of customs duties in the several countries which came within this treaty system. In 1871 the Republican Government sought to terminate the treaties of the Empire. The British negotiators nevertheless obtained the relinquishment of the attempt to levy protective duties under the guise of compensation for imposts on raw materials; the duration of the treaty of 1860 was prolonged; and stipulations better worded than those before in force were agreed to for shipping and most favoured nation treatment. In 1882, however, France terminated her existing European tariff treaties. Belgium and some other countries concluded fresh treaties, less liberal than those of the system of 1860, yet much better than anterior arrangements. Great Britain did not formally accept these higher duties; the treaty of February 28, 1882, with France, which secures most favoured nation treatment in other matters, provides that customs duties shall be "henceforth regulated by the internal legislation of each of the two States." In 1892 France also fell out of international tariff arrangements; and adopted the system of double columns of customs duties—one, of lower rates, to be applied to the goods of all nations receiving most favoured treatment; and the other, of higher rates, for countries not on this footing. Germany then took up the treaty tariff policy; and between 1891–94 concluded commercial treaties of twelve years' duration with Austria-Hungary, Belgium, Italy, the Netherlands, Russia, and Switzerland, to favour and develop her trade with those countries. An important series of commercial arrangements was concluded between 1884–1900 respecting the territories and spheres of interest of European powers in western, central, and eastern Africa. In these regions exclusive privileges are not claimed; most favoured nation treatment is recognized, and there is a disposition to extend national treatment to all Europeans and their trade.

The Turkish *Capitulations* are grants made by successive Sultans to Christian nations, conferring rights and privileges in favour of their subjects resident or trading in the Ottoman dominions. In the first instance capitulations were granted specially to each Christian State, beginning with the Genoese in 1453, which entered into pacific relations with Turkey. Afterwards new capitulations were obtained which summed up in one document earlier concessions, and added to them in general terms whatever had been conceded to one or more other States; a stipulation which became a most favoured nation article. The English final capitulations are of this nature; they are dated 1675, and have been confirmed by treaties of subsequent date "now and for ever."

Capitulations signify that which is arranged under distinct headings; the Turkish phrase is "ahid nameh," whereas a treaty is "mouahedé"—the latter does, and the former does not, signify a reciprocal engagement. Thus, although the Turkish capitulations are not in themselves treaties, yet by subsequent confirmation they have acquired the force of commercial treaties, of perpetual duration as regards substance and principles, while details, such as rates of customs duties, may, by mutual consent, be varied from time to time.

The *most favoured nation* article already referred to concedes to the State in the treaty with which it is concluded whatever advantages in the matters comprised within its stipulations have been allowed to any foreign or third State. It does not in itself directly confer any particular rights, but sums up the whole of the rights in the matters therein mentioned which have been or may be granted to foreign countries. The value of the privileges under this article accordingly varies with the conditions as to these rights in each State which concedes this treatment.

The article is drafted in different form:

(1) That contracting States A. and B. agree to extend to each other whatever rights and privileges they concede to countries C. and D., or to C. and D. and any other country. The object in this instance is to ensure specifically to B. and A. whatever advantages C. and D. may possess. A recent instance is Article XI. of the treaty of May 10, 1871, between France and Germany, which binds them respectively to extend to each other whatever advantages they grant to Austria, Belgium, Great Britain, the Netherlands, Russia, and Switzerland.

(2) The present general formula: A. and B. agree to extend to each other whatever advantages they concede to any third country; and engage that no other or higher duties shall be levied on the importation into A. and B. respectively of goods the produce or manufacture of B. and A. than are levied on the like goods the produce or manufacture of any third country the most favoured in this respect. There is a similar clause in regard to exportation.

(3) The conditional or reciprocity formula, often used in the 18th and in the early part of the 19th century, namely, that whenever A. and B. make special concessions in return for corresponding concessions, B. and A. respectively are either excluded from participation therein, or must make some additional equivalent concession in order to participate in those advantages.

It may further be observed that the word "like" relates to the goods themselves, to their material or quality, not to conditions of manufacture, mode of conveyance, or anything beyond the fact of their precise description; small local facilities allowed to traffic between conterminous land districts are not at variance with this article.

*Colonies.*—The application of commercial treaties to colonies depends upon the wording of each treaty. The earlier colonial policy of European States was to subordinate colonial interests to those of the mother country, to reserve colonial trade for the mother country, and to abstain from engagements contrary to these general rules. France, Portugal, and Spain have adhered in principle to this policy. Germany and Holland have been more liberal. The self-government enjoyed by the larger British colonies has led since 1886 to the insertion of an article in British commercial and other treaties whereby the assent of each of these colonies, and likewise of India, is reserved before they apply to each of these possessions. And further, the fact that certain other British colonies are now within the sphere of commercial intercourse controlled by the United States, has since 1891 induced the British Government to enter into special agreements on behalf of colonies for whose products the United States is now the chief market. As regards the most favoured nation article, it is to be remembered that the mother country and colonies are not foreign countries with respect to each other. The most favoured nation article, therefore, does not preclude special arrangements between the mother country and colonies, nor between colonies.

*Termination.*—Commercial treaties are usually concluded for a term of years, and either lapse at the end of this period, or are terminable then, or subsequently, if either State gives the required notice. When a portion of a country establishes its independence, for example the several American Republics, according to present usage foreign trade is placed on a uniform most favoured nation footing, and fresh treaties are entered into to regulate the commercial relations of the new communities. In the case of former Turkish provinces, the capitulations remain in force in principle until they are replaced by new engagements. If one State is absorbed into another, for instance Texas into the United States, or when territory passes by conquest, for instance Alsace to Germany, the commercial treaties of the new supreme Government take effect. In administered territories, Bosnia and Cyprus for instance, and in protected territories, it depends on the policy of the administering power how far the previous fiscal system shall remain in force. When the separate Italian States were united into the Kingdom of Italy in 1861, the commercial engagements of Sardinia superseded those of the other States, but fresh treaties were concluded by the new kingdom to place international relations on a regular footing. When the German Empire was established under the king of Prussia in 1871, the commercial engagements of any State which were at variance with a Zollverein treaty were superseded by that treaty.

The present scope of commercial treaties is well expressed by Monsieur Calvo in his work on International Law. They provide for the importation, exportation, transit, transhipment, and bonding of merchandise; customs tariffs; navigation charges; quarantine; the admission of vessels to roadsteads, ports, and docks; coasting trade; the admission of consuls and their rights; fisheries; they determine the local position of the subjects of each State in the other country in regard to residence, property, payment of taxes or exemptions, and military service; nationality; and a most favoured nation clause. They usually contain a termination, and sometimes a colonial Article. Some of the matters enumerated by Monsieur Calvo—consular privileges, fisheries, and nationality—are now dealt with by separate conventions. Contraband and neutral trade are not included as frequently as they were in the 18th century.

The preceding statement shows that commercial treaties afford to foreigners, personally, legal rights, and relief from technical disabilities: they afford security to trade and navigation, and regulate other matters comprised in their provisions. In Europe the general principles established by the series of treaties 1860–66 hold good, namely, the substitution of uniform rates of customs duties for prohibitions or differential rates. The disadvantages urged are that these treaties involve Government interference and bargaining, whereas each State should act independently as its interests require, that they are opposed to free trade, and restrict the fiscal freedom of the legislature. It may be observed that these objections imply some confusion of ideas. All contracts may be designated bargains, and some of the details of commercial treaties in Monsieur Calvo's enumeration enter directly into the functions of government; moreover, countries cannot remain isolated. Tariff arrangements are, however, open to controversy. Without discussing the Methuen Treaty (notice was given by the Portuguese Government in 1835 that it should be no longer operative), it may be admitted that its policy would not now be adopted. If, however, two countries agree by simultaneous action to adopt fixed rates of duty, this agreement is favourable to commerce, and it is not apparent how it is contrary to free trade principles. If the Legislature is restricted from imposing prohibitions or differential duties, this restriction is not injurious; and when maximum rates of duty are settled, this restriction cannot do harm if its duration is for a limited period; security in business transactions is provided by such tariff arrangements.

Our conclusions are—

(1) that under the varying jurisprudence of nations commercial treaties are adopted by common consent;

(2) that their provisions depend upon the general and fiscal policy of each State;

(3) that tariff arrangements, if judiciously settled, benefit trade;

(4) that prohibitions, and discriminating or differential duties, are injurious to trade; and to international relations;

(5) that the most favoured nation clause leads to equality of

1417 and 1496; France, 1471, 1497, and 1510; Florence, 1490. The commercial treaty policy in England was carried out systematically under Henry IV. and Henry VII. It was continued under James I. to extend to Scotland English trading privileges. The results attained in the 17th century were—regularity in treaty arrangements; their durable instead of personal nature; the conversion of permissive into perfect rights; questions as to contraband and neutral trade stated in definite terms. Treaties were at first limited to exclusive and distinct engagements between the contracting States; each treaty differing more or less in its terms from other similar compacts. Afterwards by extending to a third nation privileges granted to particular countries, the *most favoured nation article* began to be framed. Cromwell continued the commercial treaty policy in order to obtain a formal recognition of the Commonwealth by foreign Powers. His treaty of 1654 with Sweden contains the first reciprocal English most favoured nation clause. Article IV. provides that the people, subjects, and inhabitants of either confederate "shall have and possess in the countries, lands, dominions, and kingdoms of the other as full and ample privileges, and as many exemptions, immunities, and liberties, as any foreigner doth or shall possess in the dominions and kingdoms of the said confederate." The Government of the Restoration replaced and enlarged the Protectorate arrangements by fresh agreements. The general policy of the Commonwealth was maintained, with further provisions on behalf of Colonial Trade. In the new treaty of 1661 with Sweden, the privileges secured were those which "any foreigner whatsoever doth or shall enjoy in the said dominions and kingdoms on both sides."

In contemporary treaties France obtained from Spain (1659) that French subjects should enjoy the same liberties as had been granted to the English; and England obtained from Denmark (1661) that the English should not pay more or greater customs than the people of the United Provinces and other foreigners, the Swedes only excepted. The colonial and navigation policy of the 17th century, and the proceedings of Louis XIV., provoked animosities and retaliatory tariffs. During the war of the Spanish Succession the Methuen Treaty of 1703 was concluded. Portugal removed prohibitions against the importation of British woollens; Great Britain engaged that Portuguese wines should pay one-third less duty than the rate levied on French wines. At the Peace of Utrecht in 1713 political and commercial treaties were concluded. England agreed to remove prohibitions on the importation of French goods, and to grant most favoured nation treatment in relation to goods and merchandise of the like nature from any other country in Europe; the French general tariff of September 18, 1664, was to be again put in force for English trade. The English provision was at variance with the Methuen Treaty. A violent controversy arose as to the relative importance in 1713 of Anglo-Portuguese or Anglo-French trade. In the end the House of Commons, by a majority of 9, rejected the Bill to give effect to the commercial treaty of 1713; and trade with France remained on an unsatisfactory footing until 1786. The other commercial treaties of Utrecht were very complete in their provisions, equal to those of the present time; and contained most favoured nation articles—England secured in 1715 reduction of duties on woollens imported into the Austrian Netherlands; and trading privileges in Spanish America. Moderate import duties for woollens were obtained in Russia by the Commercial treaty of 1766. In the meanwhile the Bourbon family compact of August 15, 1761, assured national treatment for the subjects of France, Spain, and the Two Sicilies, and for their trade in the European territories of the other two States; and most favoured nation treatment as regards any special terms granted to any foreign country. The first commercial treaties concluded by the United States with European countries contained most favoured nation clauses: this policy has been continued by the United States, but the wording of the clause has often varied.

In 1786 France began to effect tariff reform by means of commercial treaties. The first was with Great Britain, and it terminated the long-continued tariff warfare. But the wars of the French Revolution swept away these reforms, and brought about a renewal of hostile tariffs. Prohibitions and differential duties were renewed, and prevailed on the Continent until the sixth decade of the 19th century. In 1860 a Government existed in France sufficiently strong and liberal to revert to the policy of 1786. The bases of the Anglo-French treaty of 1860, beyond its most favoured nation provisions, were in France a general transition from prohibition or high customs duties to a moderate tariff; in the United Kingdom abandonment of all protective imposts, and reduction of duties maintained for fiscal purposes to the lowest rates compatible with these exigencies. Other European countries were obliged to obtain for their trade the benefit of the conventional tariff thus established in France, as an alternative to the high rates inscribed in the general tariff. A series of commercial treaties was accordingly concluded by different European States between 1861 and 1866, which effected further reductions of customs duties in the several countries which came within this treaty system. In 1871 the Republican Government sought to terminate the treaties of the Empire. The British negotiators nevertheless obtained the relinquishment of the attempt to levy protective duties under the guise of compensation for imposts on raw materials; the duration of the treaty of 1860 was prolonged; and stipulations better worded than those before in force were agreed to for shipping and most favoured nation treatment. In 1882, however, France terminated her existing European tariff treaties. Belgium and some other countries concluded fresh treaties, less liberal than those of the system of 1860, yet much better than anterior arrangements. Great Britain did not formally accept these higher duties; the treaty of February 28, 1882, with France, which secures most favoured nation treatment in other matters, provides that customs duties shall be "henceforth regulated by the internal legislation of each of the two States." In 1892 France also fell out of international tariff arrangements; and adopted the system of double columns of customs duties—one, of lower rates, to be applied to the goods of all nations receiving most favoured treatment; and the other, of higher rates, for countries not on this footing. Germany then took up the treaty tariff policy; and between 1891–94 concluded commercial treaties of twelve years' duration with Austria-Hungary, Belgium, Italy, the Netherlands, Russia, and Switzerland, to favour and develop her trade with those countries. An important series of commercial arrangements was concluded between 1884–1900 respecting the territories and spheres of interest of European powers in western, central, and eastern Africa. In these regions exclusive privileges are not claimed; most favoured nation treatment is recognized, and there is a disposition to extend national treatment to all Europeans and their trade.

The Turkish *Capitulations* are grants made by successive Sultans to Christian nations, conferring rights and privileges in favour of their subjects resident or trading in the Ottoman dominions. In the first instance capitulations were granted specially to each Christian State, beginning with the Genoese in 1453, which entered into pacific relations with Turkey. Afterwards new capitulations were obtained which summed up in one document earlier concessions, and added to them in general terms whatever had been conceded to one or more other States; a stipulation which became a most favoured nation article. The English final capitulations are of this nature; they are dated 1675, and have been confirmed by treaties of subsequent date "now and for ever."

Capitulations signify that which is arranged under distinct headings; the Turkish phrase is "ahid nameh," whereas a treaty is "mouahedé"—the latter does, and the former does not, signify a reciprocal engagement. Thus, although the Turkish capitulations are not in themselves treaties, yet by subsequent confirmation they have acquired the force of commercial treaties, of perpetual duration as regards substance and principles, while details, such as rates of customs duties, may, by mutual consent, be varied from time to time.

The *most favoured nation* article already referred to concedes to the State in the treaty with which it is concluded whatever advantages in the matters comprised within its stipulations have been allowed to any foreign or third State. It does not in itself directly confer any particular rights, but sums up the whole of the rights in the matters therein mentioned which have been or may be granted to foreign countries. The value of the privileges under this article accordingly varies with the conditions as to these rights in each State which concedes this treatment.

The article is drafted in different form:

(1) That contracting States A. and B. agree to extend to each other whatever rights and privileges they concede to countries C. and D., or to C. and D. and any other country. The object in this instance is to ensure specifically to B. and A. whatever advantages C. and D. may possess. A recent instance is Article XI. of the treaty of May 10, 1871, between France and Germany, which binds them respectively to extend to each other whatever advantages they grant to Austria, Belgium, Great Britain, the Netherlands, Russia, and Switzerland.

(2) The present general formula: A. and B. agree to extend to each other whatever advantages they concede to any third country; and engage that no other or higher duties shall be levied on the importation into A. and B. respectively of goods the produce or manufacture of B. and A. than are levied on the like goods the produce or manufacture of any third country the most favoured in this respect. There is a similar clause in regard to exportation.

(3) The conditional or reciprocity formula, often used in the 18th and in the early part of the 19th century, namely, that whenever A. and B. make special concessions in return for corresponding concessions, B. and A. respectively are either excluded from participation therein, or must make some additional equivalent concession in order to participate in those advantages.

It may further be observed that the word "like" relates to the goods themselves, to their material or quality, not to conditions of manufacture, mode of conveyance, or anything beyond the fact of their precise description; small local facilities allowed to traffic between conterminous land districts are not at variance with this article.

*Colonies.*—The application of commercial treaties to colonies depends upon the wording of each treaty. The earlier colonial policy of European States was to subordinate colonial interests to those of the mother country, to reserve colonial trade for the mother country, and to abstain from engagements contrary to these general rules. France, Portugal, and Spain have adhered in principle to this policy. Germany and Holland have been more liberal. The self-government enjoyed by the larger British colonies has led since 1886 to the insertion of an article in British commercial and other treaties whereby the assent of each of these colonies, and likewise of India, is reserved before they apply to each of these possessions. And further, the fact that certain other British colonies are now within the sphere of commercial intercourse controlled by the United States, has since 1891 induced the British Government to enter into special agreements on behalf of colonies for whose products the United States is now the chief market. As regards the most favoured nation article, it is to be remembered that the mother country and colonies are not foreign countries with respect to each other. The most favoured nation article, therefore, does not preclude special arrangements between the mother country and colonies, nor between colonies.

*Termination.*—Commercial treaties are usually concluded for a term of years, and either lapse at the end of this period, or are terminable then, or subsequently, if either State gives the required notice. When a portion of a country establishes its independence, for example the several American Republics, according to present usage foreign trade is placed on a uniform most favoured nation footing, and fresh treaties are entered into to regulate the commercial relations of the new communities. In the case of former Turkish provinces, the capitulations remain in force in principle until they are replaced by new engagements. If one State is absorbed into another, for instance Texas into the United States, or when territory passes by conquest, for instance Alsace to Germany, the commercial treaties of the new supreme Government take effect. In administered territories, Bosnia and Cyprus for instance, and in protected territories, it depends on the policy of the administering power how far the previous fiscal system shall remain in force. When the separate Italian States were united into the Kingdom of Italy in 1861, the commercial engagements of Sardinia superseded those of the other States, but fresh treaties were concluded by the new kingdom to place international relations on a regular footing. When the German Empire was established under the king of Prussia in 1871, the commercial engagements of any State which were at variance with a Zollverein treaty were superseded by that treaty.

The present scope of commercial treaties is well expressed by Monsieur Calvo in his work on International Law. They provide for the importation, exportation, transit, transhipment, and bonding of merchandise; customs tariffs; navigation charges; quarantine; the admission of vessels to roadsteads, ports, and docks; coasting trade; the admission of consuls and their rights; fisheries; they determine the local position of the subjects of each State in the other country in regard to residence, property, payment of taxes or exemptions, and military service; nationality; and a most favoured nation clause. They usually contain a termination, and sometimes a colonial Article. Some of the matters enumerated by Monsieur Calvo—consular privileges, fisheries, and nationality—are now dealt with by separate conventions. Contraband and neutral trade are not included as frequently as they were in the 18th century.

The preceding statement shows that commercial treaties afford to foreigners, personally, legal rights, and relief from technical disabilities: they afford security to trade and navigation, and regulate other matters comprised in their provisions. In Europe the general principles established by the series of treaties 1860–66 hold good, namely, the substitution of uniform rates of customs duties for prohibitions or differential rates. The disadvantages urged are that these treaties involve Government interference and bargaining, whereas each State should act independently as its interests require, that they are opposed to free trade, and restrict the fiscal freedom of the legislature. It may be observed that these objections imply some confusion of ideas. All contracts may be designated bargains, and some of the details of commercial treaties in Monsieur Calvo's enumeration enter directly into the functions of government; moreover, countries cannot remain isolated. Tariff arrangements are, however, open to controversy. Without discussing the Methuen Treaty (notice was given by the Portuguese Government in 1835 that it should be no longer operative), it may be admitted that its policy would not now be adopted. If, however, two countries agree by simultaneous action to adopt fixed rates of duty, this agreement is favourable to commerce, and it is not apparent how it is contrary to free trade principles. If the Legislature is restricted from imposing prohibitions or differential duties, this restriction is not injurious; and when maximum rates of duty are settled, this restriction cannot do harm if its duration is for a limited period; security in business transactions is provided by such tariff arrangements.

Our conclusions are—

(1) that under the varying jurisprudence of nations commercial treaties are adopted by common consent;

(2) that their provisions depend upon the general and fiscal policy of each State;

(3) that tariff arrangements, if judiciously settled, benefit trade;

(4) that prohibitions, and discriminating or differential duties, are injurious to trade; and to international relations;

(5) that the most favoured nation clause leads to equality of

treatment and simplification of tariffs, and has become a most valuable provision alike for persons, trade, and navigation;

(6) that commercial treaties are now entered into by all States; and that they are necessary under modern conditions of commercial intercourse between nations. (C. M. K.*)

**Commons.**—*Early History.*—Commons are a relic of the system on which the lands of England were for the most part cultivated during the Middle Ages. The country was divided into vills, or townships—often, though not necessarily, or always, coterminous with the parish. In each stood a cluster of houses, a village, in which dwelt the men of the township, and around the village lay the arable fields and other lands, which they worked as one common farm. Save for a few small inclosures near the village—for gardens, orchards, or paddocks for young stock—the whole township was free from permanent fencing. The arable lands lay in large tracts, divided into compartments or fields, usually three in number, to receive in constant rotation the triennial succession of wheat (or rye), spring crops (such as barley, oats, beans, or peas), and fallow. Low-lying lands were used as meadows, and there were sometimes pastures fed according to fixed rules. The poorest land of the township was left waste—to supply feed for the cattle of the community, fuel, wood for repairs, and any other commodity of a renewable or practically inexhaustible character.[1] This waste land is the common of our own days.

It would seem likely that at one time there was no division, as between individual inhabitants or householders, of any of the lands of the township, but only of the products. But so far back as accurate information extends the arable land is found to be parcelled out, each householder owning strips in each field. These strips are always long and narrow, and lie in sets parallel with one another. The plough for cultivating the fields was maintained at the common expense of the village, and the draught oxen were furnished by the householders. From the time when the crop was carried till the next sowing, the field lay open to the cattle of the whole vill, which also had the free run of the fallow field throughout the year. But when two of the three fields were under crops, and the meadows laid up for hay, it is obvious that the cattle of the township required some other resort for pasturage. This was supplied by the waste or common. Upon it the householder turned out the oxen and horses which he contributed to the plough, and the cows and sheep, which were useful in manuring the common fields,—in the words of an old law case: "horses and oxen to plough the land, and cows and sheep to compester it." Thus the use of the common by each householder was naturally measured by the stock which he kept for the service of the common fields; and when, at a later period, questions arose as to the extent of the rights on the common, the necessary practice furnished the rule, that the commoner could turn out as many head of cattle as he could keep by means of the lands which were parcelled out to him,—the rule of levancy and couchancy, which has come down to the present day.

*Status of township.*

In the earliest post-Conquest times the vill or township is found to be associated with an over-lord. There has been much controversy on the question, whether the vill originally owned its lands free from any control, and was subsequently reduced to a state of subjection and to a large extent deprived of its ownership, or whether its whole history has been one of gradual emancipation, the ownership of the waste, or common, now ascribed by the law to the lord being a remnant of his ownership of all the lands of the vill. (See MANOR.)

At whatever date the over-lord first appeared, and whatever may have been the personal relations of the villagers to him from time to time after his appearance, there can be hardly any doubt that the village lands, whether arable, meadow, or waste, were substantially the property of the villagers for the purposes of use and enjoyment. They resorted freely to the common for such purposes as were incident to their system of agriculture, and regulated its use amongst themselves. The idea that the common was the "lord's waste," and that he had the power to do what he liked with it, subject to specific and limited qualifying rights in others, was, there is little doubt, the creation of the Norman lawyers.

*Statutes of Merton and Westminster the Second.*

One of the earliest assertions of the lord's proprietary interest in waste lands is contained in the Statute of Merton, a statute which, it is well to notice, was passed in one of the first assemblies of the Barons of England, before the Commons of the Realm were summoned to Parliament. This statute, which became law in the year 1235, provided "that the great men of England (which had enfeoffed knights and their freeholders of small tenements in their great manors)" might "make their profit of their lands, wastes, woods, and pastures," if they left sufficient pasture for the service of the tenements they had granted. Some fifty years later, another statute, that of Westminster the Second, supplemented the Statute of Merton by enabling the lord of the soil to inclose common lands, not only against his own tenants, but against "neighbours" claiming pasture there. These two pieces of legislation undoubtedly mark the growth of the doctrine which converted the over-lord's territorial sway into property of the modern kind, and a corresponding loosening of the hold of the rural townships on the wastes of their neighbourhood. To what extent the two Acts were used, it is very difficult to say. We know, from later controversies, that they made no very great change in the system on which the country was cultivated, a system to which, as we have seen, commons were essential. In some counties, indeed, inclosures had, by the Tudor period, made greater progress than in others. Tusser, in his eulogium on inclosed farming, cites Suffolk and Essex as inclosed counties by way of contrast to Norfolk, Cambridgeshire, and Leicestershire, where the open or "champion" (champain) system prevailed. The Statutes of Merton and Westminster may have had something to do with the progress of inclosed farming; but it is probable that their chief operation lay in furnishing the lord of the manor with a farm on the new system, side by side with the common fields, or with a deer park.

*The Black Death.*

The first event which really endangered the village system was the coming of the Black Death. This scourge is said to have swept away half the population of the country. The disappearance, by no means uncommon, of a whole family gave the over-lord of the vill the opportunity of appropriating, by way of escheat, the holding of the household in the common fields. The land-holding population of the townships and the persons interested in the commons were thus sensibly diminished.

During the Wars of the Roses the small cultivator is thought to have again made headway. But his diminished numbers, and the larger interest which the lords had acquired in the lands of each vill, no doubt facilitated the determined attack on the common-field system which marked the reigns of Henry VIII. and Edward VI.

[1] There is an entry on the Court Rolls of the Manor of Wimbledon of the division amongst the inhabitants of the vill of the crab-apples growing on the common.

This attack, which had for its chief object the conversion of arable land into pasture for the sake of sheep-breeding, was the outcome of many causes. It was no longer of importance to a territorial magnate to possess a large body of followers pledged to his interests by their connexion with the land. On the other hand, wool commanded a high price, and the growth of towns and of foreign commerce supplied abundant markets. At the same time the confiscation of the monastic possessions introduced a race of new over-lords—not bound to their territories by any family traditions, and also tended to spread the view that the strong hand was its own justification. In order to keep large flocks and send many bales of wool to market, each landowner strove to increase his range of pasture, and with this view to convert the arable fields of his vill into grass land. There is abundant evidence both from the complaints of writers such as Latimer and Sir Thomas More, and from the Statutes and Royal Commissions of the day, that large inclosures were made at this time, and that the process was effected with much injustice and accompanied by great hardship. "Where," says Bishop Latimer in one of his courageous and vigorous denunciations of "inclosers and rent-raisers," "there have been many householders and inhabitants, there is now but a shepherd and his dog." In the full tide of this movement, and despite Latimer's appeals, the Statutes of Merton and Westminster the Second were confirmed and re-enacted. Both common fields and commons no doubt disappeared in many places; and the country saw the first notable instalment of inclosure. But from the evidence of later years it is clear that a very large area of the country was still cultivated on the common-field system for another couple of centuries. When inclosure on any considerable scale again came into favour, it was effected on quite different principles; and before describing what was essentially a modern movement, it will be convenient to give a brief outline of the principles of law applicable to commons at the present day.

***The Tudor agrarian revolution.***

*Law.*—The distinguishing feature in law of common land is, that it is land the soil of which belongs to one person, and from which certain other persons take certain profits—for example, the bite of the grass by the mouth of cattle, or gorse, bushes, or heather for fuel or litter. The right to take such a profit is a right of common; the right to feed cattle on common land is a right of common of pasture; while the right of cutting bushes, gorse, or heather (more rarely of lopping trees) is known as a right of common of estovers or botes (from the Norman-French *estouffer*, and the Saxon *botan*, to furnish). Another right of common is that of turbary, or the right to cut turf or peat for fuel. There are also rights of taking sand, gravel, or loam for the repair and maintenance of land. The persons who enjoy any of these rights are called commoners.

***Rights of Common.***

From the sketch of the common-field system of agriculture which has been given, we shall readily infer that a large proportion of the commons of the country, and of the peculiarities of the law relating to commons, are traceable to that system. Thus, common rights are mostly attached to, or enjoyed with, certain lands or houses. A right of common of pasture usually consists of the right to turn out as many cattle as the farm or other private land of the commoner can support in winter; for, as we have seen, the enjoyment of the common, in the village system, belonged to the householders of the village, and was necessarily measured by their holdings in the common fields. The cattle thus commonable are said to be levant and couchant, *i.e.*, uprising and down-lying on the land. But it has now been decided that they need not in fact be so kept. At the present day a commoner may turn out any cattle belonging to him, wherever they are kept, provided they do not exceed in number the head of cattle which can be supported by the stored summer produce of the land in respect of which the right is claimed, together with any winter herbage it produces. The animals which a commoner may usually turn out are those which were employed in the village system—horses, oxen, cows, and sheep. These animals are termed commonable animals. A right may be claimed for other animals, such as donkeys, pigs, and geese; but they are termed non-commonable, and the right can only be established on proof of special usage. A right of pasture attached to land in the way we have described is said to be "appendant" or "appurtenant" to such land. Common of pasture appendant to land can only be claimed for commonable cattle; and it is held to have been originally attached only to arable land, though in claiming the right no proof that the land was originally arable is necessary. This species of common right is, in fact, the direct survival of the use by the village householder of the common of the township; while common of pasture appurtenant represents rights which grew up between neighbouring townships, or, in later times, by direct grant from the owner of the soil of the common to some other landowner, or (in the case of copyholders) by local custom.

The characteristic of connexion with house or land also marks other rights of common. Thus a right of taking gorse or bushes, or of lopping wood for fuel, called fire-bote, is limited to the taking of such fuel as may be necessary for the hearths of a particular house, and no more may be taken than is thus required. The same condition applies to common of turbary, which in its more usual form authorizes the commoner to cut the heather, which grows thickly upon poor soils, with the roots and adhering earth, to a depth of about 9 inches. Similarly, wood taken for the repairs of buildings (house-bote), or of hedges (hedge-bote or hey-bote), must be limited in quantity to the requirements of the house, farm buildings, and hedges of the particular property to which the right is attached. And heather taken for litter cannot be taken in larger quantities than is necessary for manuring the lands in respect of which the right is enjoyed. It is illegal to take the wood or heather from the common, and to sell it to any one who has not himself a right to take it. So, also, a right of digging sand, gravel, clay, or loam is usually appurtenant to land, and must be exercised with reference to the repair of the roads, or the improvement of the soil, of the particular property to which the right is attached.

We have already alluded to the fact that, in Norman and later days, every vill or township was associated with some over-lord,—some one responsible to the crown, either directly or through other superior lords, for the holding of the land and the performance of certain duties of defence and military support. To this lord the law has assigned the ownership of the soil of the common of the vill; and the common has for many centuries been styled the waste of the manor. The trees and bushes on the common belong to the lord, subject to any rights of lopping or cutting which the commoners may possess. The ground, sand, and subsoil are his, and even the grass, though the commoners have the right to take it by the mouths of their cattle. To the over-lord, also, was assigned a seignory over all the other lands of the vill; and the vill came to be termed his manor. At the present day it is the manorial system which must be invoked in most cases as the foundation of the curiously conflicting rights which co-exist on a common. (See MANOR.)

**Manorial Commons.**

Within the bounds of a manor, speaking generally, there are three classes of persons possessing an interest in the land, viz.:—

(*a*) Persons holding land freely of the manor, or freehold tenants.

(*b*) Persons holding land of the manor by copy of Court Roll, or copyhold tenants.

(*c*) Persons holding from the lord of the manor, by lease or agreement, or from year to year, land which was originally demesne, or which was once freehold or copyhold and has come into the lord's hands by escheat or forfeiture.

Amongst the first two classes we usually find the majority of the commoners on the wastes or commons of the manor. To every freehold tenant belongs a right of common of pasture on the commons, such right being "appendant" to the land which he holds freely of the manor. This right differs from most other rights of common in the characteristic that actual exercise of the right need not be proved. When once it is shown that certain land is held freely of the manor, it follows of necessity that a right of common of pasture for commonable cattle attaches to the land, and therefore belongs to its owner, and may be exercised by its occupant. "Common appendant," said the Elizabethan judges, "is of common right, and commences by operation of law and in favour of tillage."

Now this is exactly what we saw to be the case with reference to the use of the common of the vill by the householder cultivating the arable fields. The use was a necessity, not depending upon the habits of this or that householder; it was a use for commonable cattle only, and was connected with the tillage of the arable lands. It seems almost necessarily to follow that the freehold tenants of the manor are the representatives of the householders of the vill. However this may be, it is amongst the freehold tenants of the manor that we must first look for commoners on the waste of the manor.

Owing, however, to the light character of the services rendered by the freeholders, the connexion of their lands with the manor is often difficult to prove. Copyhold tenure, on the other hand, cannot be lost sight of; and in many manors copyholders are numerous, or were, till quite recently. Copyholders almost invariably possess a right of common on the waste of the manor; and when (as is usual) they exist side by side with freeholders, their rights are generally of the same character. They do not, however, exist as of common right, without proof of usage, but by the custom of the manor. Custom has been defined by a great judge (the late Sir George Jessel, M.R.) as local law. Thus, while the freehold tenants enjoy their rights by the general law of the land, the copyholders have a similar enjoyment by the local law of the manor. This, again, is what one might expect from the ancient constitution of a village community. The copyholders, being originally serfs, had no rights at law; but as they had a share in the tillage of the land, and gradually became possessed of strips in the common fields, or of other plots on which they were settled by the lord, they were admitted by way of indulgence to the use of the common; and the practice hardened into a custom. As might be expected, there is more variety in the details of the rights they exercise. They may claim common for cattle which are not commonable, if the custom extends to such cattle; and their claim is not necessarily connected with arable land.

In the present day large numbers of copyhold tenements have been enfranchised, *i.e.*, converted into freehold. The effect of this step is to sever all connexion between the land enfranchised and the manor of which it was previously held. Technically, therefore, the common rights previously enjoyed in respect of the land would be gone. When, however, there is no indication of any intention to extinguish such rights, the courts protect the copyholders in their continued enjoyment; and when an enfranchisement is effected under the statutes passed in modern years, the rights are expressly preserved. The commoners on a manorial common then will be, *primâ facie*, the freeholders and copyholders of the manor, and the persons who own lands which were copyhold of the manor but have been enfranchised.

The occupants of lands belonging to the lord of the manor, though they usually turn out their cattle on the common, do so by virtue of the lord's ownership of the soil of the common, and can, as a rule, make no claim to any right of common as against the lord, even though the practice of turning out may have obtained in respect of particular lands for a long series of years. When, however, lands have been sold by the lord of the manor, although no right of common attached by law to such lands in the lord's hands, their owners may subsequently enjoy such a right, if it appears from the language of the deeds of conveyance, and all the surrounding circumstances, that there was an intention that the use of the common should be enjoyed by the purchaser. The rules on this point are very technical; it is sufficient here to indicate that lands bought from a lord of a manor are not necessarily destitute of common rights.

**Rights of common not connected with manorial system.**

So far we have considered common rights as they have arisen out of the manorial system, and out of the still older system of village communities. There may, however, be rights of common quite unconnected with the manorial system. Such rights may be proved either by producing a specific grant from the owner of the manor or by long usage. It is seldom that an actual grant is produced, although it would seem likely that such grants were not uncommon at one time. But a claim founded on actual user is by no means unusual. Such a claim may be based (*a*) on immemorial usage, *i.e.*, usage for which no commencement later than the coronation of Richard I. can be shown, (*b*) on a presumed modern grant which has been lost, or (*c*) (in some cases) on the Prescription Act. There are special rules applicable to each kind of claim.

A right of common not connected with the manorial system may be, and usually is, attached to land; it may be measured, like a manorial right, by levancy and couchancy, or it may be limited to a fixed number of animals. Rights of the latter character seem to have been not uncommon in the Middle Ages. In one of his sermons against inclosure, Bishop Latimer tells us his father "had walk (*i.e.*, right of common) for 100 sheep." This may have been a right in gross, but was more probably attached to the "farm of £3 or £4 by year at the uttermost" which his father held. In a recent case a right of common for 200 sheep over the waste of the manor of Banstead was established in respect of the manor of South Tadworth. Such a right may be sold separately, and enjoyed by a purchaser independently of the tenement to which it was originally appurtenant. It then becomes a right of common in gross.

A right of common in gross is a right enjoyed irrespective of the ownership or occupancy of any lands. It may exist by express grant, or by user implying a modern lost grant, or by immemorial usage. It must be limited to a certain number of cattle, unless the right is claimed by actual grant. Such rights seldom arise in connexion with commons in the ordinary sense, but are a frequent incident of regulated or stinted pastures; the right is then generally known as a cattle-gate or beast-gate.

There may be rights over a common which exclude the owner of the soil from all enjoyment of some particular product of the common. Thus a person, or a class of persons, may be entitled to the whole of the corn, grass, underwood, or sweepage (*i.e.*, everything which falls to the

sweep of the scythe) of a tract of land, without possessing any ownership in the land itself, or in the trees or mines. Such a right is known as a right of sole vesture.

A more limited right of the same character is a right of sole pasturage—the exclusive right to take everything growing on the land in question by the mouths of cattle, but not in any other way. Either of these rights may exist throughout the whole year, or during part only. A right of sole common pasturage and herbage was given to a certain class of commoners in Ashdown Forest on the partition of the forest at the end of the 18th century.

***Rights in common fields.***

We have seen that the common arable fields and common meadows of a vill were thrown open to the stock of the community between harvest and seed-time. There is still to be found, here and there, a group of arable common fields, and occasionally a piece of grass land with many of the characteristics of a common, which turns out to be a common field or meadow. The Hackney Marshes and the other so-called commons of Hackney are really common fields or common meadows, and along the valley of the Lea a constant succession of such meadows is met with. They are still owned in parcels marked by metes; the owners have the right to grow a crop of hay between Lady Day and Lammas Day; and from Lammas to March the lands are subject to the depasturage of stock. In the case of some common fields and meadows the right of feed during the open time belongs exclusively to the owners; in others to a larger class, such as the owners and occupiers of all lands within the bounds of the parish. Anciently, as we have seen, the two classes would be identical. In some places new-comers not owning strips in the fields were admitted to the right of turn out; in others, not. Hence the distinction. Similar divergences of practice will be found to exist in Switzerland at the present day; *nieder-gelassene*, or new-comers, are in some communes admitted to all rights, while, in others, privileges are reserved to the *bürger*, or old inhabitant householders.

***Rights in Royal Forests.***

Some of the largest tracts of waste land to be found in England are the waste or commonable lands of Royal Forests or Chases. The thickets and pastures of Epping Forest, now happily preserved for London under the guardianship of the City Corporation, and the noble woods and far-stretching heaths of the New Forest, will be called to mind. Cannock Chase, unhappily inclosed according to law, though for the most part still lying waste, Dartmoor, and Ashdown Forest in Sussex, are other instances; and the list might be greatly lengthened. Space will not permit of any description of the forest system; it is enough, in this connexion, to say that the common rights in a forest were usually enjoyed by the owners and occupiers of land within its bounds (the class may differ in exact definition, but is substantially equivalent to this) without reference to manorial considerations. Epping Forest was saved by the proof of this right. It is often said that the right was given, or confirmed, to the inhabitants in consideration of the burden of supporting the deer for the pleasure of the king or of the owner of the chase. It seems more probable that the forest law prevented the growth of the manorial system, and with it those rules which have tended to restrict the class of persons entitled to enjoy the waste lands of the district.

***Prevention of inclosure.***

We have seen that in the case of each kind of common there is a division of interest. The soil belongs to one person; other persons are entitled to take certain products of the soil. This division of interest preserves the common as an open space. The commoners cannot inclose, because the land does not belong to them. The owner of the soil cannot inclose, because inclosure is inconsistent with the enjoyment of the commoners' rights. At a very early date it was held that the right of a commoner proceeded out of every part of the common, so that the owner of the soil could not set aside part for the commoner and inclose the rest. The Statutes of Merton and Westminster the Second were passed to get over this difficulty. But under these statutes the burden of proving that sufficient pasture was left was thrown upon the owner of the soil; such proof can very seldom be given. Moreover, the statutes have never enabled an inclosure to be made against commoners entitled to estovers or turbary. It seems clear that the statutes had become obsolete in the time of Edward VI., or they would not have been re-enacted. And we know that the zealous advocates of inclosure in the 18th century considered them worthless for their purposes. Practically it may be taken that, save where the owner of the soil of a common acquires all the lands in the township (generally coterminous with the parish) with which the common is connected, an inclosure cannot legally be effected by him. And even in the latter case it may be that rights of common are enjoyed in respect of lands outside the parish, and that such rights prevent an inclosure.

***The modern Inclosure Act.***

*Modern Inclosure.*—When, therefore, the common-field system began to fall out of gear, and the increase of population brought about a demand for an increased production of corn, it was felt to be necessary to resort to Parliament for power to effect inclosure. The legislation which ensued was based on two principles. One was, that all persons interested in the open land to be dealt with should receive a proportionate equivalent in inclosed land; the other, that inclosure should not be prevented by the opposition, or the inability to act, of a small minority. Assuming that inclosure was desirable, no more equitable course could have been adopted, though in details particular Acts may have been objectionable. The first Act was passed in 1709; but the precedent was followed but slowly, and not till the middle of the 18th century did the annual number of Acts attain double figures. The high-water mark was reached in the period from 1765 to 1785, when on an average forty-seven Acts were passed every year. From some cause, possibly the very considerable expense attending upon the obtaining of an Act, the numbers then began slightly to fall off. In the year 1793 a Board of Agriculture, apparently similar in character to the Chambers of Commerce of our own day, was established. Sir John Sinclair was its president, and Arthur Young, the well-known agricultural reformer, was its secretary. Owing to the efforts of this body, and of a Select Committee appointed by the House of Commons on Sinclair's motion, the first General Inclosure Act was passed in 1801. This Act would at the present day be called an Inclosure Clauses Act. It contained a number of provisions applicable to inclosures, which could be incorporated, by reference, in a private Bill. By this means, it was hoped, the length and complexity, and consequently the expense, of inclosure Bills would be greatly diminished. Under the stimulus thus applied inclosure proceeded apace. In the year 1801 no less than 119 Acts were passed, and the total area inclosed probably exceeded 300,000 acres. Three inclosures in the Lincolnshire Fens account for over 53,000 acres. As before, the movement after a time spent its force, the annual average of Acts falling to about twelve in the decade 1830–40. Another Parliamentary committee then sat to consider how inclosure might be promoted; and the result was the Inclosure Act, 1845, which, though much amended by subsequent legislation, still stands on the statute-book. The chief feature of that

Act was the appointment of a permanent Commission to make in each case all the inquiries previously made (no doubt capriciously and imperfectly) by Committees of the two Houses. The Commission, on being satisfied of the propriety of an inclosure, was to draw up a provisional order prescribing the general conditions on which it was to be carried out, and this order was to be submitted to Parliament by the Government of the day for confirmation. It is believed that these inclosure orders afford the first example of the provisional order system of legislation, which has recently attained such large proportions.

Again inclosure moved forward, and between 1845 and 1869 (when it received a sudden check) 600,000 acres passed through the hands of the Inclosure Commission. Taking the whole period of about a century and a half, when Parliamentary inclosure was in favour, and making an estimate of acreage where the Acts do not give it, the result may be thus summarized:—

| | Acres. |
|---|---|
| From 1709 to 1797 . . . . | 2,744,926 |
| ,, 1801 to 1842 . . . . | 1,307,964 |
| ,, 1845 to 1869 . . . . | 618,000 |
| Add for Forests inclosed under Special Acts . . . . . | 100,000 |
| | 4,770,890 |

The total area of England being 37,000,000 acres, we shall probably not be far wrong in concluding that about one acre in every seven was inclosed during the period in question. During the first period, the lands inclosed consisted mainly of common arable fields; during the second, many great tracts of moor and fen were reduced to severalty ownership. In the third period, inclosure probably related chiefly to the ordinary manorial common; and it seems likely that, on the whole, England would have gained, had inclosure stopped in 1845.

***Open space movement.***

As a fact it stopped in 1869. Before the Inclosure Commission had been in existence twenty years the feeling of the nation towards commons began to change. The rapid growth of towns, and especially of London, and the awakening sense of the importance of protecting the public health, brought about an appreciation of the value of commons as open spaces. Naturally, the metropolis saw the birth of this sentiment. An attempted inclosure in 1864 of the commons at Epsom and Wimbledon aroused strong opposition; and a Select Committee of the House of Commons was appointed to consider how the London commons could best be preserved. The Metropolitan Board of Works, then in the vigour of youth, though eager to become the open-space authority for London, could make no better suggestion than that all persons interested in the commons should be bought out, that the board should defray the expense by selling parts for building, and should make parks of what was left. Had this advice been followed, London would probably have lost two-thirds of the open space which she now enjoys. Fortunately a small knot of men, who afterwards formed the Commons Preservation Society, took a broader and wiser view. Chief amongst them were the late Mr Philip Lawrence, who acted as solicitor to the Wimbledon opposition, and subsequently organized the Commons Preservation Society, Mr George Shaw-Lefevre, chairman of that Society since its foundation, the late Mr John Locke, and the late Lord Mount Temple (then Mr W. F. Cowper). They urged that the conflict of legal interests, which is the special characteristic of a common, might be trusted to preserve it as an open space, and that all that Parliament could usefully do, was to restrict Parliamentary inclosure, and to pass a measure of police for the protection of commons as open spaces. The Select Committee adopted this view. On their report, was passed the Metropolitan Commons Act, 1866, which prohibited any further Parliamentary inclosures within the Metropolitan police area, and provided means by which a common could be put under local management. The lords of the manors in which the London commons lay felt that their opportunity of making a rich harvest out of land, valuable for building, though otherwise worthless, was slipping away; and a battle royal ensued. Inclosures were commenced, and the Statute of Merton prayed in aid. The public retorted by legal proceedings taken in the names of commoners. These proceedings—which culminated in the mammoth suit as to Epping Forest, with the Corporation of London as plaintiffs and fourteen lords of manors as defendants—were uniformly successful; and London commons were saved. By degrees the manorial lords, seeing that they could not hope to do better, parted with their interest for a small sum to some local authority; and a large area of the common land, not only in the county of London but in the suburbs, is now in the hands of the representatives of the ratepayers, and is definitely appropriated to the recreation of the public.

***Amendment of Statute of Merton.***

Moreover, the Commons Preservation Society was able to base, upon the uniform success of the commoners in the law courts, a plea for the amendment of the law. The Statute of Merton, we have seen, purports to enable the lord of the soil to inclose a common, if he leaves sufficient pasture for the commoners. This statute was constantly vouched in the litigation about London commons; but in no single instance was an inclosure justified by virtue of its provisions. It thus remained a trap to lords of manors, and a source of controversy and expense. In the year 1893 Lord Thring, at the instance of the Commons Preservation Society, carried through Parliament the Commons Law Amendment Act, which provided that in future no inclosure under the Statute of Merton should be valid, unless made with the consent of the Board of Agriculture, which was to consider the expediency of the inclosure from a public point of view.

***Rural commons.***

The movement to preserve commons as open spaces soon spread to the rural districts. Under the Inclosure Act of 1845 provision was made for the allotment of a part of the land to be inclosed for field gardens for the labouring poor, and for recreation. But those who were interested in effecting an inclosure often convinced the Inclosure Commissioners, that for some reason such allotments would be useless. To such an extent did the reservation of such allotments become discredited that, in 1869, the Commission proposed to Parliament the inclosure of 13,000 acres, with the reservation of only one acre for recreation, and none at all for field gardens. This proposal attracted the attention of the late Mr Fawcett, who, after much inquiry and consideration, came to the conclusion that inclosures were, speaking generally, doing more harm than good to the agricultural labourer, and that, under such conditions as the Commissioners were prescribing, they constituted a serious evil. With characteristic intrepidity he opposed the annual Inclosure Bill (which had come to be considered a mere form) and moved for a Committee on the whole subject. The ultimate result was the passing, seven years later, of the Commons Act, 1876. This measure, introduced by a Conservative Government, laid down the principle that an inclosure should not be allowed unless distinctly shown to be for the benefit, not merely of private persons, but of the neighbourhood generally and the public. It imposed many checks upon

the process, and, following the course already adopted in the case of Metropolitan commons, offered an alternative method of making commons more useful to the nation, viz., their management and regulation as open spaces. The effect of this legislation and of the changed attitude of the House of Commons towards inclosure has been almost to stop that process, except in the case of common fields or extensive mountain wastes. Only some twenty-four commons, comprising about 26,000 acres, have been inclosed by Act of Parliament since 1876.

*Regulation.*

We have alluded to the regulation of commons as open spaces. The primary object of this process is to bring a common under the jurisdiction of some constituted authority, which may make bye-laws, enforceable in a summary way before the magistrates of the district, for its protection, and may appoint watchers or keepers to preserve order and prevent wanton mischief. There are several means of attaining this object. Commons within the Metropolitan police district—the Greater London of the Registrar-General—are in this respect in a position by themselves. Under the Metropolitan Commons Acts, schemes for their local management may be made by the Board of Agriculture (in which the Inclosure Commission is now merged) without the consent either of the owner of the soil or the commoners—who, however, are entitled to compensation if they can show that they are injuriously affected. Outside the Metropolitan police district a provisional order for regulation may be made under the Commons Act, 1876, with the consent of the owner of the soil and of persons representing two-thirds in value of all the interests in the common. And under an Act passed in 1899 the council of any urban or rural district may, with the approval of the Board of Agriculture and without recourse to Parliament, make a scheme for the management of any common within its district, provided no notice of dissent is served on the Board by the lord of the manor or by persons representing one-third in value of such interests in the common as are affected by the scheme. There is yet another way of protecting a common. A parish council may, by agreement, acquire an interest in it, and may make bye-laws for its regulation under the Local Government Act, 1894. It is probable that in future commons outside the Metropolitan police area will be managed chiefly under the Acts of 1894 and 1899. They undoubtedly proceed on right lines. For, with the growth of efficient local government, commons naturally fall to be protected and improved by the authority of the district.

*Statistics.*

It remains to say a word as to the extent of common land still remaining open in England and Wales. In 1843 it was estimated that there were still 10,000,000 acres of common land and common-field land. In 1874 another return made by the Inclosure Commission made a guess of 2,632,772. These two returns were made from the same materials, viz., the Tithe Commutation Awards. As less than 700,000 acres had been inclosed in the intervening period, it is obvious that the two estimates are mutually destructive. In July 1875 another version was given in the Return of Landowners (generally known as the Modern Domesday Book), compiled from the valuation lists made for the purposes of rating. This return put the commons of the country (not including common fields) at 1,524,648 acres. It is impossible to view any of these returns as accurate. Those compiled from the Tithe Commutation Awards are based largely on estimates, since there are many parishes where the tithes had not been commuted. On the other hand, the valuation lists do not show waste and unoccupied land (which is not rated), and consequently the information as to such lands in the Return of Landowners was based on any materials which might happen to be at the disposal of the Clerk of the Guardians. All we can say, therefore, is that the acreage of the remaining common land of the country is probably somewhere between 1,500,000 and 2,000,000 acres. It is most capriciously distributed. In the Midlands there is very little to be found, while in a county of poor soil, like Surrey, nearly every parish has its common, and there are large tracts of heath and moor. In 1866, returns were made to Parliament by the Overseers of the Poor of the commons within 15 and within 25 miles of Charing Cross. The acreage within the larger area was put at 38,450 acres, and within the smaller at 13,301; but owing to the difference of opinion which sometimes prevails upon the question, whether land is common or not, and the carelessness of some parish authorities as to the accuracy of their returns, even these figures cannot be taken as more than approximately correct. The Metropolitan police district, within which the Metropolitan Commons Acts are in force, approaches in extent to a circle of 15 miles' radius. Within this district nearly 12,000 acres of common land have been put under local management, either by means of the Commons Acts or under special legislation. London is to be congratulated on having secured so much recreation ground on its borders. But when the enormous population of the capital and its rapid growth and expansion are considered, the conclusion is inevitable, that not one acre of common land within an easy railway journey of the metropolis can be spared.

**Como,** chief town of the Italian province of Como, and situated at the south-western extremity of the lake of the same name. Next to Milan, Como has made more rapid progress than any Lombard city since 1875. Its population, which numbered 25,560 in 1881, was 38,902 in 1901, while the population of the province was 576,276 in 1901, having increased by 61,226 since 1881. The density of the population is 2·16 per square kilometre. In Como and its immediate neighbourhood many large silk-weaving establishments have been founded. In consequence of the construction of a funicular railway from Como to Brunate Hill, 716 metres above the city, a new quarter and climatic station have grown up at Brunate. Between 1881 and 1900, 179 kilometres of new railways were built in the province of Como, besides two funicular railways and an electric tramway. A further electric line is in course of construction. The making of provincial and State roads has kept pace with the growth of railway communication. At the same time, the navigation of the three lakes of Como, Maggiore, and Lugano, both by steam and sailing vessels, has notably increased. A telephone system, 310 miles in length, connects Como with the chief communes of the province. In 1900 the industrial establishments of the province of Como numbered 870, of which nearly one-half are devoted to various branches of the silk industry. There are, besides, cotton industries, paper-making, iron-working, telegraph cables, lime-kilns, and cement factories. The number of workmen and workwomen employed in the silk industry is

55,000. In 1860 Como possessed 3000 hand looms; in 1899, 11,000, while 3500 machine looms had been introduced. Since one machine loom is equal to three hand looms, the weaving potentiality of Como has been multiplied sevenfold in thirty years. The importance of this development is the more noteworthy in view of the fact that, while Como possesses 3500 steam looms, only 2000 exist in the rest of Italy. The Como factories yield products of an estimated annual value of 60,000,000 lire. Most of the Como silk is exported, especially to London and to the Levant.

The mountainous character of the province of Como and the excessive subdivision of landed property retard the introduction of improved methods of agriculture. The Agricultural Unions, however, have succeeded in promoting the use of artificial manure and in increasing the productivity of the soil. The most important improvements have taken place in regard to the raising of silk-worms by the introduction of a system of selecting the eggs, and by modifications of the peasants' houses. Industrial progress and agricultural improvements have combined in producing in the province an unusual degree of prosperity. The spirit of initiative and the activity of the inhabitants found expression in 1899 in the Silk and Electrical Exhibition, organized to celebrate the first centenary of the invention of the electric pile by Alessandro Volta, a native of Como. The Exhibition, opened in May 1899, was destroyed by fire in the following July, but was rebuilt and reopened within a few weeks by its original organizers. An International Electrical Congress took place in connexion with the Exhibition. The distinction gained as early as the ninth century in building and architecture by the *Magistri Comacini* still excites the emulation of the inhabitants of the region, who, as specialists in the art of building, emigrate to all parts of Europe. The spirit of reverence for historical buildings and local artistic memories has led to the restoration during the last few years of Como Cathedral, and of the churches of Sant' Abbondio, San Fedele, San Carpoforo, and other minor monuments of the province. (L. Bi.)

**Como,** a lake of North Italy, lying at the foot of the Rhætic Alps, directly north from Milan. Area, according to Marinelli, $56\frac{1}{4}$ square miles; maximum depth, 1358 ft.; altitude above sea-level, 653 ft.; temperature at the bottom, 42°·8 Fahr. During the day a southerly wind, the Breva, blows pretty constantly, and during the night a northerly wind, the Tivano. The difference between "high" water and "low" water levels amounts to as much as 16 ft. Its shores are thickly studded with silk factories.

**Comoro Islands,** a group of islands belonging to France, situated half-way between Madagascar and the African continent, to the north of the Mozambique Channel. The following table of the area and population of the only four of any size gives one of the sets of figures offered by various authorities:—

| Island. | Area (square miles). | Population. |
|---|---|---|
| Mayotte | 140 | 9,000 |
| Great Comoro | 385 | 50,000 |
| Moheli | 90 | 9,000 |
| Anjouan | 145 | 12,000 |
| Total | 760 | 80,000 |

The islands are of volcanic formation and bristle with mountains, the highest of which is Coratola (8500 feet). The soil is very fertile, and covered with forests of cocoanut and fig trees. The climate is in general warm, but not torrid nor unsuitable for Europeans. The dry season lasts from May to October, the rest of the year being rainy. The natives, who form practically the whole of the population, are of Malagasy, Negro, and Arab blood. The more important localities are Dzaudai, a small island off Mayotte, where are the government headquarters; M'sapéré, on the opposite mainland, which is the chief centre of trade in the island; Bambao, in Anjouan; Fomboni, in Moheli; and Movoni, in Great Comoro.

Mayotte was occupied as a colony in 1843, and has long been completely subject to the French, who, however, have experienced some trouble in the other islands, over which they extended a protectorate in 1886. The administration, as regulated by the decree of September 1899, is under a governor of the whole group, who himself administers Mayotte, but governs the other three islands through administrators. At Mayotte there are a tribunal of first instance and a paymaster. Each island has its own local budget. That of Mayotte, which alone receives a subvention from France, shares more than half the totals, which in 1901 were estimated to balance at about £20,000. Mayotte also appropriated £1055 in the 1901 colonial budget of France, and in consequence of a destructive cyclone in 1898 borrowed £20,000, to be paid in 20 years, without interest. Great Comoro has a debt of £38,000. Mayotte produces sugar, vanilla, rice, coffee, cacao. For the rest, Anjouan is the most favourable to cultivation, especially of vanilla, but the cocoanut is gathered. In Great Comoro copra is prepared and zebras are reared. The only industrial establishments in the group are sugar-works and saw-mills. Trade statistics are only issued for Mayotte, but this term may include the whole group. In 1898 imports totalled £28,300 (France £21,200). In 1898 exports totalled £49,320 (France £47,890). The movement of the vessels of the Messageries Maritimes at Mayotte reaches 5000 tons for vessels with cargoes. At present it is rather because of their strategic than their commercial value that the Comoros are of importance. A coaling station has been established among them.

**Company.**—Joint stock enterprise derives its vitality from the co-operative principle, by which a multitude of small investors create a fund to be used in furtherance of some commercial undertaking for the common benefit of all. The natural growth and expansion of this fruitful principle was checked until the middle of the nineteenth century by the notorious risks attaching to unlimited liability. In the case of an ordinary partnership, though their liability is unlimited, the partners can generally tell what risks they are incurring. Not so the shareholders of a company. They delegate the management of their business to a board of directors, and they may easily find themselves committed by the fraud or folly of its members to engagements which in the days of unlimited liability meant ruin. Failures like those of Overend and Gurney, and of the Glasgow Bank, caused widespread misery and alarm. It was not until limited liability had been grafted on the stock of the co-operative system that the real potency of the principle of industrial co-operation became apparent. We owe the adoption of the limited liability principle to the clear-sightedness of Lord Sherbrooke—then Mr Robert Lowe—and to the vigorous advocacy of Lord Bramwell. We owe it to Lord Bramwell also that the principle was made a feasible one. The practical difficulty was how to bring home to persons dealing with the company notice that the liability of the share-

holders was limited. Lord Bramwell solved the problem by a happy suggestion—"write it on my tombstone," he said humorously to a friend. This was that the company should add to its name the word "Limited"—paint it up on its premises, and use it on all its invoices, bills, promissory notes, and other documents. The proposal was adopted by the Legislature and has worked successfully. The best evidence of the influence which the introduction of limited liability has exercised is to be found in the returns of companies registered under the Act of 1862. That Act contemplates three classes of companies—(1) companies limited by shares, (2) companies limited by guarantee, (3) unlimited companies. The number of companies limited by shares which were registered from the commencement of the Act to the year 1901 is 60,000; of companies limited by guarantee, 1300; of unlimited companies, 140. The companies limited by shares show a progressive increase from 689 in 1863 to 4675 in 1897; the unlimited companies registered in 1863 were 8 in number, in 1897 they were nil. The unlimited company is practically an extinct species. The company limited by shares has become the normal type: it is incomparably the most important, and as such it is chiefly dealt with in this article.

*Companies Limited by Shares.*—The Companies Act, 1862, was intended to constitute a comprehensive code of law applicable to joint stock trading companies for the whole of the United Kingdom. Recognizing the mischief of large trading concerns being carried on by fluctuating bodies, the Act begins by declaring that no company, association, or partnership, consisting of more than twenty persons, or ten in the case of banking, shall be formed after the commencement of the Act for the purpose of carrying on any business which has for its object the acquisition of gain by the company, association, or partnership, or by the individual members thereof, unless it is registered as a company under the Act, or is formed in pursuance of some other Act of Parliament or of letters patent, or is a company engaged in working mines within and subject to the jurisdiction of the Stannaries. Broadly speaking, the meaning of the Act is that all commercial undertakings, as distinguished from literary or charitable associations, shall be registered. "Business" has a more extensive signification than "trade." Having thus cleared the ground the Act goes on to provide in what manner a company may be formed under the Act. The machinery is simple, and is described as follows:—

"Any seven or more persons associated for any lawful purpose may, by subscribing their names to a memorandum of association and otherwise complying with the requisitions of this Act in respect of registration, form an incorporated company with or without limited liability" (§ 6). The fact that six of the subscribers are mere dummies, clerks, or nominees of the seventh, will not affect the validity of the company; so the House of Lords decided in *Salomon* v. *Salomon and Co.* (1897, A. C. 22). The document to be subscribed—the Memorandum of Association—corresponds, in the case of companies formed under the Companies Act, 1862, to the charter or deed of settlement in the case of other companies. The form of it is given in the schedule to the Act, and varies slightly according as the company is limited by shares or guarantee, or is unlimited. (See the 2nd schedule to the Act, forms A, B, C, D.) It is required to state, in the case of a company limited by shares, the five following matters:—

***Memorandum of Association.***

1. The name of the proposed company, with the addition of the word "limited" as the last word in such name.
2. The part of the United Kingdom, whether England, Scotland, or Ireland, in which the registered office of the company is proposed to be situate.
3. The objects for which the proposed company is to be established.
4. A declaration that the liability of the members is limited.
5. The amount of capital with which the company proposes to be registered, divided into shares of a certain fixed amount.

No subscriber of the memorandum is to take less than one share, and each subscriber is to write opposite his name the number of shares he takes.

These five matters the Legislature has deemed of such intrinsic importance that it has required them to be set out in the company's Memorandum of Association. They are the essential conditions of incorporation, and as such they must not only be stated, but the policy of the Legislature has made them unalterable, with certain exceptions.

The most important of these five conditions is the third, and its importance consists in this, that the objects defined in the memorandum circumscribe the sphere of the company's activities. This principle, which is one of public policy and convenience, and is known as the "*ultra vires* doctrine," carries with it important consequences, because every act done or contract made by a company *ultra vires*, *i.e.*, in excess of its powers, is absolutely null and void. The policy, too, is a sound one. Shareholders contribute their money on the faith that it is to be employed in prosecuting certain objects, and it would be a violation of good faith if the company, *i.e.*, the majority of shareholders, were to be allowed to divert it to something quite different. So strict is the rule that not even the consent of every individual shareholder can give validity to an *ultra vires* act. The consent of all the shareholders was, till quite recently, equally incompetent to alter the objects defined in the memorandum, as being part of the so-called charter. The inconveniences attending this unalterability of the objects were, however, so sensibly felt that in 1890 the Companies (Memorandum of Association) Alteration Act was passed, qualifying the prohibition against alteration, but only to a limited extent. This Act enables a company to obtain the sanction of the Court to an alteration of the objects in its memorandum when it appears that the alteration is required for certain specified purposes, such as the carrying on of the company's business more economically or more efficiently.

***Articles of Association.***

A company's Memorandum of Association was described by Lord Cairns as its charter. The Articles of Association are the regulations for its internal management—the terms of the partnership agreed upon by the shareholders among themselves. They regulate such matters as the transfer and forfeiture of shares, calls upon shares, the appointment and qualification of directors, their powers and proceedings, general meetings of the shareholders, votes, dividends, the keeping and audit of accounts, and other such matters. In regard to these internal regulations the Legislature has left the company free to adopt whatever terms of association it chooses. It has furnished in the schedule to the Companies Act, 1862 (Table A), a model or specimen set of regulations, but their adoption, wholly or in part, is optional; only if a company does not register articles of its own these statutory regulations are to apply. When, as is commonly the case, a company decides to have articles of its own framing, such articles must be expressed in separate paragraphs, numbered arithmetically, and signed by the subscribers of the memorandum. They must also be printed, stamped like a deed, and attested. When so perfected, they are to be delivered, with the Memorandum of Association, to the Registrar of Joint Stock Com-

panies, who is to retain and register them. The stamp duty charged on the company's capital must at the same time be paid. The Memorandum and Articles of Association thereupon become public documents, and any person may inspect them on payment of a fee of one shilling. This has important consequences, because every person dealing with the company is presumed to be acquainted with its constitution, and to have read its memorandum and articles. The articles also, upon registration, bind the company and its members to the same extent as if each member had subscribed his name and affixed his seal to them.

The capital which is required to be stated in the Memorandum of Association is what is known as the nominal capital. This nominal capital must be distinguished from the subscribed capital, which is the aggregate amount agreed to be paid by those who have taken shares in the company. Under the Companies Act, 1900, a "minimum subscription" may be fixed by the articles, and if it is, the directors cannot go to allotment on less: if it is not, then the whole of the capital offered for subscription must be subscribed. A company may increase its capital, consolidate it, subdivide it into shares of smaller amount, or convert paid-up shares into stock, and for this purpose modify its Memorandum of Association; but a limited company cannot reduce its capital either by direct or indirect means without the sanction of the Court. The inviolability of the capital is a condition of incorporation—the price of the privilege of trading with limited liability, and by no subterfuge will a company be allowed to evade this cardinal rule of policy, either by paying dividends out of capital, or buying its own shares, or returning money to shareholders. But the prohibition against reduction means that the capital must not be reduced by the voluntary act of the company, not that a company's capital must be kept intact. It is embarked in the company's business, and it must run the risks of such business. If part of it is lost there is no obligation on the company to replace it and to cease paying dividends until such lost capital is repaid. The company may in such a case—and no course can be more beneficial to it—write off the lost capital and go on trading with the reduced amount. But for this purpose the sanction of the Court must be obtained by petition.

*Capital.*

A company being a legal abstraction, invisible and intangible, can do nothing in its own person. It must act through agents. These agents are commonly called directors, though they are occasionally described by other names, such as committee men, council, or managers. The first directors of a company are generally appointed by the Articles of Association. Their consent to act must now, under the Companies Act, 1900, be filed with the Registrar of Joint Stock Companies. Directors other than the first are elected at the annual general meeting, a certain proportion of the acting directors—usually one-third—retiring under the articles by rotation each year, and their places being filled up by election. A share qualification is often required, on the well-recognized principle that a substantial stake in the undertaking is the best guarantee of fidelity to the company's interests. A director once appointed cannot be removed during his term of office by the shareholders, unless there is a special provision for that purpose in the Articles of Association; but a company may dismiss a director if the articles—as is usually the case—authorize dismissal. The authority and powers of directors are *primâ facie* those necessary for carrying on the ordinary business of the company, but as a rule they are more particularly defined by the Articles of Association. For instance, it is commonly prescribed how and when the directors may make calls, to what amount they may borrow, in what circumstances they may forfeit shares, or veto transfers, or invest funds, and what shall constitute a quorum of the board. Whenever, indeed, specific directions are desirable they may properly be given by the articles. But superadded to and supplementing these specific powers there is usually inserted in the articles a general power of management in terms similar to those of Clause 58 of the statutory regulations known as Table A. The powers, whether general or specific, thus confided to directors are in the nature of a trust, and the directors must exercise them with a single eye to the benefit of the company. It would, however, give a very erroneous idea of their positions and functions to speak of them as trustees. They have to carry on the company's business, to extend and consolidate it, and to do this they must have a free hand and a large discretion to deal with the exigencies of the commercial situation. This large discretion the law allows them, so long as they keep within the limits set by the company's Memorandum and Articles. They are not to be held liable for mere errors of judgment, still less for being defrauded. That would make their position intolerable. All that the law requires of them is that they should be faithful to their duties as agents—"honest and diligent." They must not, for instance, delegate their duties, or accept a bribe, or make a secret profit, or pay dividends out of capital, or misapply the company's funds.

*Directors.*

Where in these or in any other ways directors are guilty of misfeasance or breach of trust in regard to the company or its property, the remedy of the company, if it is a going concern, is by action against the delinquent; but where a company is being wound up, the Legislature has provided a summary mode of proceeding under the Winding-up Act, 1890, by which the official receiver or liquidator, or any creditor or contributory of the company may take out what is known as a misfeasance summons, to compel the delinquent director or officer to repay the misapplied moneys or make compensation. Directors who circulate a prospectus containing statements which they know to be false, with intent to induce any person to become a shareholder, may be prosecuted under § 84 of the Larceny Act, 1861. They are also liable criminally for falsification of the company's books, and for this or any other criminal offence the Court in winding-up may, on the application of the liquidator, direct a prosecution.

*Misfeasance.*

A share is an aliquot part of a company's nominal capital. The amount may be anything from 1s. to £1000. The tendency of late years has been to keep the denomination low, and so to appeal to a wider public. Shares of £100, or even £10, are now the exception. The most common amount is either £1 or £5. Shares are of various kinds,—ordinary, preference, deferred, founders', and management. Into what classes of shares the original capital of the company shall be divided, what shall be the amount of each class, and their respective rights, privileges, and priorities, are matters for the consideration of the promoters of the company, and must depend on its special circumstances and requirements.

*Shares.*

A company may issue preference shares even if there is no mention of them in the Memorandum of Association, but it is, as a rule, desirable that the Memorandum define the rights of preference shareholders, as their rights cannot then be altered or infringed. The preference given may be as to dividends only, or as to dividends and capital. The dividend, again, may be payable out of the year's profits only, or cumulative. The question for the company is, what must be offered to attract investors. Founders'

shares — which originated with private companies — are shares which usually take the whole or half the profits after payment of a dividend of 7 or 10 per cent to the ordinary shareholders. They are much less in favour than they used to be.

An agreement to take shares is like any other agreement. It is constituted by offer, acceptance, and communication of the acceptance to the offerer. The offer in the case of shares is usually in the form of an application in writing to the company, made in response to a prospectus, requesting the company to allot the applicant a certain number of shares in the undertaking on the terms of the prospectus, and agreeing to accept the shares, or any smaller number, which may be allotted to the applicant. Under the Companies Act, 1900, an allottee is entitled to rescind his contract unless the minimum subscription has been obtained. When an application is accepted the shares are allotted, and a letter of allotment is posted to the applicant. Allotment is the usual, but not the only, evidence of acceptance. As soon as the letter of allotment is posted the contract is complete, even though the letter never reaches the applicant. An application for shares can be withdrawn at any time before acceptance. As soon as the contract is complete, it is the duty of the company to enter the shareholder's name in the register of members, and to issue to him a certificate under the seal of the company, evidencing his title to the shares.

***Register of members.***

The register of members plays an important part in the scheme of the company system, under the Companies Act, 1862. The principle of limited liability having been once adopted by the Legislature, justice required not only that such limitation of liability should be brought home by every possible means to persons dealing with the company, but also that such persons should know as far as possible what was the limited capital—the sole fund available to satisfy their claims, what amount had been called up, what remained uncalled, who were the persons to pay, and in what amounts. These data might materially assist a person dealing with the company in determining whether he would give it credit or not; in any case they are matters which the public had a right to know. The Legislature, recognizing this, has exacted as a condition of the privilege of trading with limited liability that the company shall keep a register with those particulars in it, which shall be accessible to the public at all reasonable times. In order that this register may be accurate, and correspond with the true liability of membership for the time being, the Court is empowered under the Companies Act, 1862, to rectify it in a summary way, on application by motion, by ordering the name of a person to be entered or removed. This power can be exercised by the Court, whether the dispute as to membership is one between the company and an alleged member, or between one alleged member and another, but the machinery of the section is not meant to be used to try claims to rescind agreements to take shares. The proper proceeding in such cases is by action.

***Payment for shares.***

The same policy of guarding against an abuse of limited liability is evinced in the provision of the Act that shares in the case of a limited company shall be paid for in full. The Legislature has allowed such companies to trade with limited liability, but the price of the privilege is that the limited capital to which alone the creditors can look shall at least be a reality. It is therefore *ultra vires* for a limited company to issue its shares at a discount; but there was nothing in the Companies Act, 1862, which required that the shares of a limited company, though they must be paid up in full, must be paid up in cash. They might be paid "in meal or in malt," and it accordingly became common for shares to be allotted in payment for furniture, plate, advertisements, or services. The result was that the consideration was often illusory, shares being issued to be paid for in some commodity which had no certain criterion of value. To remedy this evil the Legislature enacted in the Companies Act, 1867 (§ 25), that every share in any company should be held subject to the payment of the whole amount thereof in cash, unless otherwise determined by a contract in writing filed with the Registrar of Joint Stock Companies at or before the issue of the shares. This section not infrequently caused hardship where shares had been honestly paid for in the equivalent of cash, but owing to inadvertence no contract had been filed; and it has now been repealed by the Companies Act, 1900, and the old law restored. In reverting to the earlier law, and allowing shares to be paid for in any adequate consideration, the Legislature has, however, exacted a safeguard. It has required the company to file with the Registrar of Joint Stock Companies a return stating, in the case of shares allotted in whole or in part for a consideration other than cash, the number of the shares so allotted, and the nature of the consideration—property, services, &c.—for which they have been allotted.

Though every share carries with it the liability to pay up the full amount in cash, the liability is only to pay when and if the directors call for it to be paid up. A call must fix the time and place for payment, otherwise it is bad.

***Rescission of agreement.***

When a person takes shares from a company on the faith of a prospectus containing any false or fraudulent representations of fact material to the contract, he is entitled to rescind the contract. The company cannot keep a contract obtained by the misrepresentation or fraud of its agents. This is an elementary principle of law. The misrepresentation, for purposes of rescission, need not be fraudulent; it is sufficient that it is false in fact: fraud or recklessness of assertion will give the shareholder a further remedy by action of deceit, or under the Directors' Liability Act, 1890; but, to entitle him to rescind, the shareholder must show that he took the shares on the faith or partly on the faith of the false representation: if not, it was innocuous. A shareholder claiming to rescind must do so promptly. It is too late to commence proceedings after a winding-up has begun.

***Transfer of shares.***

The shares or other interest of any member in a company are personal estate and may be transferred in the manner provided by the regulations of the company. As Lord Blackburn said, it was one of the chief objects with which joint stock companies were established, that the shares should be capable of being easily transferred; but though every shareholder has a *primâ facie* right to transfer his shares, this right is subject to the regulations of the company, and the company may and often does by its regulations require that a transfer shall receive the approval of the board of directors before being registered, — the object being to secure the company against having an insolvent or undesirable shareholder (the nominee perhaps of a rival company) substituted for a solvent and acceptable one. This power of the directors to refuse a transfer must not be exercised arbitrarily or capriciously. If it were, it would amount to a confiscation of the shares. Directors, for instance, cannot veto a transfer because they disapprove of the purpose for which it is being made (*e.g.*, to multiply votes), if there is no objection to the transferee.

A company can only pay dividends out of profits—defined as the "earnings of a concern after deducting

the expenses of earning them." To pay dividends out of capital is not only *ultra vires* but illegal, as constituting a return of capital to shareholders. Before paying dividends, directors must take reasonable care to secure the preparation of proper balance-sheets and estimates, and must exercise their judgment as business men on the balance-sheets and estimates submitted to them. If they fail to do this, and pay dividends out of capital, they will not be held excused. The onus is on them to show that the dividends have been paid out of profits. The Court as a rule does not interfere with the discretion of directors in the matter of paying dividends, unless they are doing something *ultra vires*.

***Dividends.***

The Companies Acts, and the regulations under them, regard the directors of a company as the persons in whom the management of the company's affairs is vested. But they also contemplate the ultimate controlling power as residing in the shareholders. A controlling power of this kind can only assert itself through general meetings; and that it may have proper opportunities of doing so, every company is required to hold a general meeting, commonly called the statutory meeting, within—as now fixed by the Companies Act, 1900—three months from the date at which it is entitled to commence business, and thenceforward one general meeting at least every year. This annual general meeting is usually called the ordinary general meeting. Other meetings are extraordinary general meetings. Notices convening a general meeting must inform the shareholders of the particular business to be transacted; otherwise any resolutions passed at the meeting will be invalidated. Voting is generally regulated by the articles. Sometimes a vote is given to a shareholder for every share held by him, but more often a scale is adopted; for instance, one vote is given for every share up to ten, with an additional vote for every five shares beyond the first ten shares up to one hundred, and an additional vote for every ten shares beyond the first hundred. In default of any regulations, every member has one vote only. Sometimes preference shareholders are given no vote at all.

***Meetings.***

The machinery of company formation is generally set in motion by a person known as a promoter. This is a term of business, not law. It means, to use Chief-Justice Cockburn's words, a person "who undertakes to form a company with reference to a given project and to set it going, and who takes the necessary steps to accomplish that purpose." Whether what a person has done towards this end constitutes him a promoter or not, is a question of fact; but once an affirmative conclusion is reached, equity clothes such promoter with a fiduciary relation towards the company which he has been instrumental in creating. This doctrine is now well established, and its good sense is apparent when once the position of the promoter towards the company is understood. Promoters—to use Lord Cairns's language in *Erlanger* v. *New Sombrero Phosphate Co.* (3 App. Cas. 1236)—"have in their hands the creation and moulding of the company. They have the power of defining how and when and in what shape and under what supervision it shall start into existence and begin to act as a trading corporation." Such a control over the destinies of the company involves correlative obligations towards it, and one of these obligations is that the promoter must not take advantage of the company's helplessness. A promoter may sell his property to the company, but he must make full and fair disclosure of his interest in order that the company may determine whether it will or will not authorize its trustee or agent to make a profit out of the sale. It is not a sufficient disclosure in such a case for the promoter merely to refer in the prospectus to a contract which, if read by the shareholders, would inform them of his interest. They are under no obligation to inquire. It is for the promoter to bring home notice, not constructive but actual, to the shareholders. When a company is promoted for acquiring property—to work a mine, for instance, or carry on a going business—the usual course is for the promoter to frame a draft agreement for the sale of the property to the company or to a trustee on its behalf. The memorandum and articles of the intended company are then prepared, and an article is included authorizing or requiring the directors to adopt the draft agreement for sale. In pursuance of this authority the directors at the first meeting after incorporation take the draft agreement into consideration; and if they approve, adopt it—provisionally, that is—for under the Companies Act, 1900, no contract is to bind a company unless it has obtained a certificate from the Registrar of Joint Stock Companies that it has complied with certain formalities entitling it to commence business. Where they do so in the exercise of an honest and independent judgment, no exception can be taken to the transaction; but where the directors happen to be nominees of the promoter, perhaps qualified by him and acting in his interest, the plan is obviously open to grave abuse.

***Promoter.***

When a company intends to appeal to the public to subscribe its capital, the usual way of doing so is by issuing a prospectus. A prospectus is an invitation to the public to take shares on the faith of the statements therein contained, and is thus the basis of the agreement to take the shares; there therefore rests on those who are responsible for its issue an obligation to act with the most perfect good faith—*uberrima fides*—and this obligation has been repeatedly emphasized by judges of the highest eminence. (See the observations of Lord Herschell in *Derry* v. *Peek*, 14 App. Cas. 376.) Directors must be perfectly candid with the public; they must not only state what they do state with strict and scrupulous accuracy, but they must not omit any fact which, if disclosed, would falsify the statements made. This is the general obligation of directors when issuing a prospectus; but on this general obligation the Legislature has engrafted special requirements. By the Companies Act, 1867, it required the dates and names of the parties to any contract entered into by the company or its promoters or directors before the issue of the prospectus, to be disclosed in the prospectus; otherwise the prospectus was to be deemed fraudulent. This enactment has now been repealed by the Companies Act, 1900, but only in favour of more stringent provisions. Under the new Act not only is every prospectus to be signed and filed with the Registrar of Joint Stock Companies before it can be issued, but the prospectus must set forth a series of specified particulars about the company—the contents of the Memorandum of Association, with the names of the signatories, the share qualification (if any) of the directors, the minimum subscription on which the directors may proceed to allotment, the shares and debentures issued otherwise than for cash, the names and addresses of the vendors, the amount paid for underwriting the company, the amount of preliminary expenses, of promotion money (if any), and the interest (if any) of every director in the promotion or in property to be acquired by th company. Neglect of this statutory duty of disclosure will expose directors to personal liability. For false or fraudulent statements—as distinguished from non-disclosure—in a prospectus directors are liable in an action of deceit or under the Directors' Liability Act, 1900. This Act was passed to meet the decision of the House of Lords in *Peek* v. *Derry* (12 App. Cas. 33), that a director could not

***Prospectus.***

be made liable in an action of deceit for an untrue statement in a prospectus, unless the plaintiff could prove that the director had made the untrue statement fraudulently. The Directors' Liability Act enacts in substance that when once a prospectus is proved to contain a material statement or fact which is untrue, the persons responsible for the prospectus are to be liable to pay compensation to any one who has subscribed on the faith of the prospectus, unless they can prove that they had reasonable ground to believe, and did in fact believe, the statement to be true. Actions under this Act have been extremely rare, but it may have had the effect of making directors more careful in their statements.

**Private companies.** It has become very common of late years for a private trader to convert his business into a limited company, with a view not to offering the shares to the public, but to securing the advantages incident to incorporation. Companies of this kind form one-third of the whole number of companies registered yearly, and are known as "Private Companies," to distinguish them from companies which appeal to the public to subscribe their capital. The special characteristic of the private company is not, however, the manner in which the capital is raised, but the fact that the shares are held in a few hands.

The so-called "one-man company" is a variety of the private company. The fact that a company is formed by one man, with the aid of six dummy subscribers, is not in itself (as was at one time supposed) a fraud on the policy of the Companies Acts, but it is occasionally used for the purpose of committing a fraud, as where an insolvent trader turns himself into a limited company in order to evade bankruptcy; and it is to an abuse of the Act of this kind that the term "one-man company" owes its opprobrious signification.

*Companies Limited by Guarantee.*—The second class of limited companies are those limited by guarantee, as distinguished from those limited by shares. In the company limited by guarantee each member agrees, in the event of a winding-up, to contribute a certain amount to the assets. The interests of the members of a guarantee company have no nominal value in money like the shares of other companies, a form of constitution which was designed, as has been stated by Lord Thring, who drafted the Companies Act, 1862, to give a superior elasticity to the company. The property of the company simply belongs to the company in certain fractional amounts. This makes it convenient for clubs, syndicates, and other associations which do not require the interest of members to be expressed in terms of cash.

*Companies not for Gain.*—Associations formed to promote commerce, art, science, religion, charity, or any other useful object may, with the sanction of the Board of Trade, register under the Companies Act, 1862, with limited liability, but without the addition of the word "Limited," upon proving to the Board that it is the intention of the association to apply the profits or income of the association in promoting its objects, and not in payment of dividends to members (C. A., 1867, § 23). In lieu of the word "Company," the association may adopt as part of its name some such title as chamber, club, college, guild, institute, or society. The power given by this section has proved very useful, and many kinds of associations have availed themselves of it, *e.g.*, medical institutes, law societies, nursing homes, and chambers of commerce. No such association can hold more than two acres of land without the license of the Board of Trade.

*Cost-Book Mining Companies.*—These are in substance mining partnerships. They derive their name from the partnership agreement, the expenses and receipts of the mine, the names of the shareholders, and any transfers of shares being entered in a "cost-book." The affairs of the company are managed by an agent known as a "purser," who from time to time makes calls on the members for the expenses of working. A cost-book company is not bound to register under the Companies Act, 1862, but it may do so.

*British Companies Abroad.*—The status of British companies trading abroad, so far as Germany, France, Belgium, Greece, Italy, and Spain are concerned, is expressly recognized in a series of conventions entered into between those countries and Great Britain. Where no such convention exists the status of an immigrant corporation depends upon international comity, which allows foreign corporations, as it does foreign persons, to sue, to make contracts, and hold real estate, in the same way as domestic corporations or citizens; provided the stranger corporation does not offend against the policy of the State in which it seeks to trade.

**Winding up.** A company once incorporated under the Companies Act, 1862, cannot be put an end to except through the machinery of a winding-up, though the name of a company which is commercially defunct may be struck off the register of Joint Stock Companies by the registrar under § 7 of the Companies Act, 1880. Winding-up is of two kinds: (1) voluntary winding-up, either purely voluntary or carried on under the supervision of the Court; and (2) winding-up by the Court. Of these by far the more common is a voluntary winding-up. Ninety per cent of the companies that come to an end are so wound up; and this is in accordance with the policy of the Legislature, evinced throughout the Companies Acts, that shareholders should manage their own affairs—winding-up being one of such affairs. **Voluntary.** A voluntary winding-up is carried out by the shareholders passing a special resolution requiring the company to be wound up voluntarily, or an extraordinary resolution to the effect that it has been proved to the shareholders' satisfaction that the company cannot, by reason of its liabilities, continue its business, and that it is advisable to wind it up (C. A., 1862, § 129). The resolution is generally accompanied by the appointment of a liquidator. In a purely voluntary winding-up there is a power given by § 138 for the company or any contributory to apply to the Court in any matter arising in the winding-up, but seemingly by an oversight of the Legislature the same right was not given to creditors. This has now been rectified by the Companies Act, 1900, § 25. A creditor may also in a proper case obtain an order for continuing the voluntary winding-up under the supervision of the Court. Such an order has also the advantage of operating as a stay of any actions or executions pending against the company. Except in these respects, the winding-up remains a voluntary one. The Court does not actively intervene unless set in motion; but it requires the liquidator to bring his accounts into chambers every quarter, so that it may be informed how the liquidation is proceeding. When the affairs of the company are fully wound up, the liquidator calls a meeting, lays his accounts before the shareholders, and the company is dissolved by operation of law three months after the date of the meeting (C. A., 1862, §§ 142, 143).

**By the Court.** Irrespective of voluntary winding-up, the Legislature has defined certain events in which a company formed under the Companies Act, 1862, may be wound up by the Court. These events are: (1) when the company has passed a resolution requiring the company to be wound up by the Court; (2) when the company does not commence its business

within a year or suspends it for a year; (3) when the members are reduced to less than seven; (4) when the company is unable to pay its debts, and (5) whenever the Court is of opinion that it is just and equitable that the company should be wound up (C. A., 1862, § 79). A petition for the purpose may be presented either by a creditor, a contributory, or the company itself. Where the petition is presented by a creditor who cannot obtain payment of his debt, a winding-up order is *ex debito justitiæ* as against the company or shareholders, but not as against the wishes of a majority of creditors.

The procedure on the making of a winding-up order is now governed by §§ 7, 8, 9 of the Winding-up Act, 1890. The official receiver, as liquidator *pro tem.*, requires a statement of the affairs of the company verified by the directors, and on it reports to the Court as to the causes of the company's failure, and whether further inquiry is desirable. If he further reports that in his opinion fraud has been committed in the promotion or formation of the company by a particular person, the Court may order such person to be publicly examined.

A liquidator's duty is to protect, collect, realize, and distribute the company's assets; and for this purpose he advertises for creditors, makes calls on contributories, sues debtors, takes misfeasance proceedings, if necessary, against directors or promoters, and carries on the company's business, supposing the goodwill to be an asset of value—with a view to selling it as a going concern. He is assisted, like a trustee in bankruptcy, by a committee of inspection, composed of creditors and contributories.

**Reconstruction.** A large number of companies now wind-up only to reconstruct. The reasons for a reconstruction are generally either to raise fresh capital, or to get rid of onerous preference shares, or to enlarge the scope of the company's objects, which is otherwise impracticable owing to the unalterability of the Memorandum of Association. Reconstructions are carried out in one of two ways: (1) by sale and transfer of the company's undertaking and assets to a new company, either under a power to sell contained in the Company's Memorandum of Association or under § 161 of the Companies Act, 1862; or (2) by a scheme of arrangement, sanctioned by the Court, under the Joint Stock Companies Arrangements Act, 1870.

*Public Companies.*—Besides trading companies there is another large class, which for shortness may be called public companies, *i.e.*, companies constituted by special Act of Parliament for the purpose of constructing and carrying on some undertaking of public utility, such as railways, canals, docks, waterworks, gasworks. The rights of members of these companies, the duties and liabilities of the undertakers and directors, depend on the conjoint operation of the Companies Special Act and of the Companies Clauses Acts, 1845, 1863, 1869. The special Act supplies the peculiar powers and provisions which the particular company requires, and the Companies Clauses Acts those general powers and provisions which are necessarily or usually inserted in the constitution of such public company,—regulating the distribution of capital, the transfer of shares, payment of calls, borrowing, and general meetings. A distinguishing feature of these companies is that, being sanctioned by the Legislature for undertakings of public utility, the policy of the law will not allow them to be broken up or destroyed by creditors. It gives creditors only a charge on the receipts—"the fruit of the tree."

**Comparetti, Domenico** (1835——), Italian scholar, was born at Rome, 27th June 1835. His father, a native of Liguria, who had fought under Napoleon, had destined his son for a military career, but the boy had such a marked distaste for physical exertion that this idea had to be abandoned. Instead, he began to study at the University of Rome, and took his degree in 1855 in natural science and mathematics. Directly afterwards he entered his uncle's pharmacy as assistant. Here he diligently pursued his profession, though he was gradually learning that his real bent was for literature, not science. His scanty leisure was now given to study, and every coin he could spare was spent on books. He learned Greek by himself, and gained facility in the modern language by conversing with the Greek students at the university. In spite of all disadvantages, he not only mastered the difficulties of the language, but became before long one of the chief classical scholars of Italy. In 1857 he made a translation of some recently discovered fragments of Hyperides, and added to it a dissertation on that orator. This was published in the *Rheinisches Museum*, and was followed by a notice of the annalist Granius Licinianus, and one on the oration of Hyperides on the Lamian War. He also wrote some articles for the *Spettatore Fiorentino* and the *Archivio Storico Italiano*. In 1859 he was appointed professor of Greek at Pisa on the recommendation of the Duke of Sermoneta. A few years later he was called to a similar post at Florence, remaining emeritus professor at Pisa also. At this time he made the acquaintance of a Jewish lady from Odessa, who became his wife. Residing in Rome, and lecturing on Greek antiquities, he has taken an active interest in the Forum excavations. He is a member of the governing bodies of the academies of Milan, Venice, Naples, and Turin. The list of his writings is long and varied. Of his works in classical literature, the best known are an edition of the *Euxenippus* of Hyperides, and monographs on Pindar and Sappho. In the *Kalewala and the Traditional Poetry of the Finns*, he discusses the national epic of Finland and its heroic songs, with a view to solving the problem whether an epic could be composed by the interweaving of such national songs. He comes to a negative conclusion, and applies this reasoning to the Homeric problem. He treats this question again in a treatise on the so-called Peisistratean edition of Homer. His *Vergil in the Middle Ages*, which has been translated into English, traces the strange vicissitudes by which the great Augustan poet became successively grammatical fetich, Christian prophet, and wizard. Together with Professor Alessandro of Ancona, Comparetti edited a collection of Italian national songs and stories, many of which had been collected and written down by himself for the first time.

**Compass.**—The Mariner's compass is an instrument by means of which the directive force of that great magnet, the Earth, upon a freely-suspended needle, is utilized for a purpose essential to navigation. The needle is so mounted that it only moves freely in the horizontal plane, and therefore the horizontal component of the earth's force alone directs it. The direction assumed by the needle is not generally towards the geographical north, but diverges towards the east or west of it, making a horizontal angle with the true meridian, called the Magnetic Variation or Declination; amongst mariners this angle is known as the Variation of the compass. In the usual navigable waters of the world the variation alters from 30° to the east to 45° to the west of the geographical meridian, being

westerly in the Atlantic and Indian oceans, easterly in the Pacific. The vertical plane passing through the longitudinal axis of such a needle is known as the Magnetic Meridian. Following the first chart of lines of equal variation compiled by Halley in 1700, charts of similar type have been published from time to time embodying recent observations and corrected for the secular change, thus providing seamen with values of the variation accurate to about 30′ of arc. Possessing these data it is easy to ascertain by observation the effects of the iron in a ship in disturbing the compass, and it will be found for the most part in every vessel that the needle is deflected from the magnetic meridian by a horizontal angle called the Deviation of the compass; in some directions of the ship's head adding to the known variation of the place, in other directions subtracting from it. Local magnetic disturbance of the needle due to magnetic rocks is observed on land in all parts of the world, and in certain places extends to the land under the sea, affecting the compasses on board the ships passing over it. The general direction of these disturbances in the northern hemisphere is an attraction of the north-seeking end of the needle; in the southern hemisphere, its repulsion. The approaches to Cossack, North Australia; Cape St Francis, Labrador; the coasts of Madagascar and Iceland, are remarkable for such disturbance of the compass. The compass as we know it is the result of the necessities of navigation, which have increased from century to century. It consists of five principal parts—the card, the needles, the bowl, a jewelled cap, and the pivot. The card or "fly," formerly made of cardboard, now consists of a disc either of mica covered with paper, or of paper alone, but in all cases the card is divided into points and degrees as shown in Fig. 1.

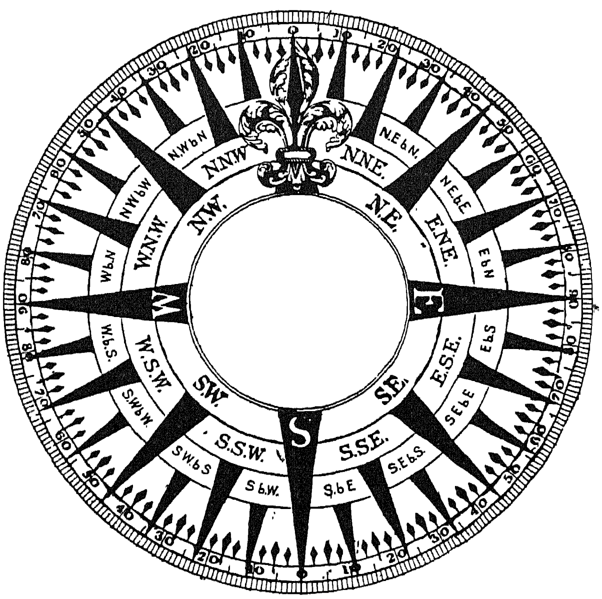

Fig. 1.—Compass Card.

The outer margin is divided into degrees with 0° at north and south, and 90° at east and west; the 32 points with half and quarter points are seen immediately within the degrees. The north point is marked with a *fleur-de-lis*, and the principal points, N.E., E., S.E., &c., with their respective names, whilst the intermediate points in the figure have also their names engraved for present information. The arc contained between any two points is 11° 15′. The mica card is generally mounted on a brass framework, F F, with a brass cap, C, fitted with a sapphire centre and carrying four magnetized needles, N, N, N, N, as in Fig. 2. The more modern form of card consists of a broad ring of paper marked with degrees and points, as in Fig. 1, attached to a frame like that in Fig. 3, where an outer

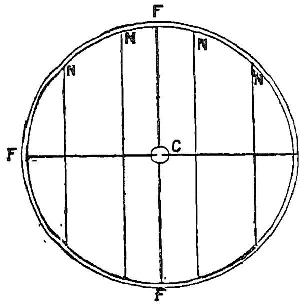

Fig. 2.—Admiralty Compass (Frame and Needles).

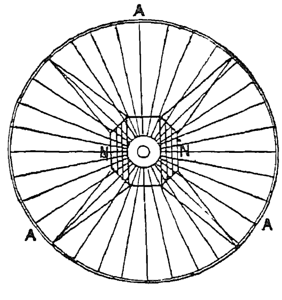

Fig. 3.—Thomson's (Lord Kelvin's) Compass (Frame and Needles).

aluminium ring, A A, is connected by 32 radial silk threads to a central disc of aluminium, in the centre of which is a round hole designed to receive an aluminium cap with a highly-polished sapphire centre worked to the form of an open cone. To direct the card eight short light needles, N N, are suspended by silk threads from the outer ring. The magnetic axis of any system of needles must exactly coincide with the axis passing through the north and south points of the card. Single needles are never used, two being the least number, and these so arranged that the moment of inertia about every diameter of the card shall be the same. The combination of card, needles, and cap is generally termed "the card"; on the continent of Europe it is called the "rose." The section of a compass bowl in Fig. 4 shows the mounting of a Thomson card on its pivot, which in common with the pivots of most other compasses is made of brass, tipped with osmium-iridium, which although very hard can be

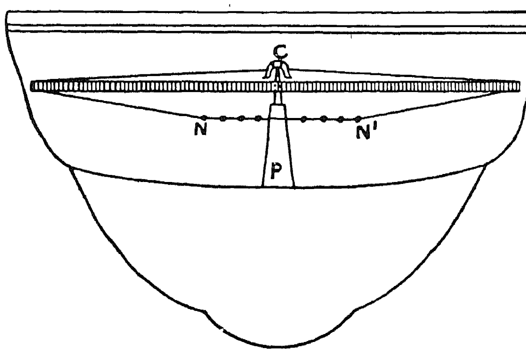

Fig. 4.—Section of Thomson's Compass Bowl. C, aluminium cap with sapphire centre; N, N′, needles; P, pivot stem with pivot.

sharply pointed and does not corrode. Fig. 4 shows the general arrangement of mounting all compass cards in the bowl. In Fig. 5 another form of compass called a liquid or spirit compass is shown partly in section. The card nearly floats in a bowl filled with distilled water, to which 35 per cent. of alcohol is added to prevent freezing; the bowl is hermetically sealed with pure india-rubber, and a corrugated expansion chamber is attached to the bottom to allow for the expansion and contraction of the liquid. The card is a mica disc, either painted as in Fig. 1, or covered with linen upon which the degrees and points are printed, the needles being enclosed in brass.

Great steadiness of card under severe shocks and vibrations, combined with a minimum of friction in the cap and pivot, is obtained with this compass. All compasses are fitted with a gimbal ring to keep the bowl and card level under every circumstance of a ship's motion in a seaway, the ring being connected with the binnacle or pedestal by means of journals or knife edges. On the inside of every

compass bowl a vertical black line is drawn, called the "lubber's point," and it is imperative that when the compass is placed in the binnacle the line joining the

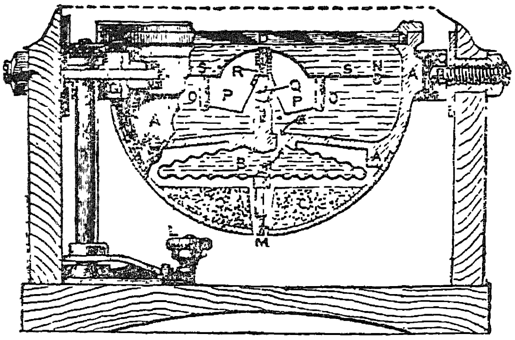

FIG. 5.—Liquid Compass. A, bowl, partly in section; B, expansion chamber; D, the gla [illegible] out to expand chamber when filling bowl; M, screw [illegible] filling, with screw plug; O, O, magnetic needles; [illegible]; Q, iridium pivot; R, sapphire cap; S, mica card.

pivot and the lubber's point be parallel to the keel of the vessel. Thus, when a degree on the card is observed opposite the lubber's point, the angle between the direction in which the ship is steering and the north point of the compass or course is at once seen; and if the magnetic variation and the disturbing effects of the ship's iron are known, the desired angle between the ship's course and the geographical meridian can be computed. In every ship a position is selected for the navigating or standard compass as free from neighbouring iron as possible, and by this compass all courses are shaped and bearings taken. It is also provided with an azimuth circle or mirror and a shadow pin or style placed in the centre of the glass cover, by either of which the variable angle between the compass north and true north, called the "total error," or variation and deviation combined, can be observed. The binnacles or pedestals for compasses are generally constructed of wood about 45 inches high, and fitted to receive and alter at pleasure the several magnet and soft iron correctors. They are also fitted with different forms of suspension in which the compass is mounted to obviate the mechanical disturbance of the card caused by the vibration of the hull in ships driven by powerful engines.

The effects of the iron and steel used in the construction of ships upon the compass have occupied the attention of the ablest physicists of the 19th century, with results which enable navigators to conduct their ships with perfect safety. The hull of an iron or steel ship is a magnet, and the distribution of its magnetism depends upon the direction of the ship's head when building, this result being produced by induction from the earth's magnetism, developed and impressed by the hammering of the plates and frames during the process of building. The disturbance of the compass by the magnetism of the hull is generally modified, sometimes favourably, more often unfavourably, by the magnetized fittings of the ship, such as masts, conning towers, deck houses, engines, and boilers. Thus in every ship the compass needle is more or less subject to deviation differing in amount and direction for every azimuth of the ship's head. This was first demonstrated by Commander Matthew Flinders by experiments made in H.M.S. *Investigator* in 1800–3, and in 1810 led that officer to introduce the practice of placing the ship's head on each point of the compass, and noting the amount of deviation whether to the east or west of the magnetic north, a process which is in full exercise at the present day, and is called "swinging ship." When speaking of the magnetic properties of iron it is usual to adopt the terms "soft" and "hard." Soft iron is iron which becomes instantly magnetized by induction when exposed to any magnetic force, but has no power of retaining its magnetism. Hard iron is less susceptible of being magnetized, but when once magnetized it retains its magnetism permanently. The term "iron" used in these pages includes the "steel" now commonly employed in shipbuilding. If an iron ship be swung when upright for deviation, and the mean horizontal and vertical magnetic forces at the compass positions be also observed in different parts of the world, mathematical analysis shows that the deviations are caused partly by the permanent magnetism of hard iron, partly by the transient-induced magnetism of soft iron both horizontal and vertical, and in a lesser degree by iron which is neither magnetically hard nor soft, but which becomes magnetized in the same manner as hard iron, though it gradually loses its magnetism on change of conditions, as, for example, in the case of a ship, repaired and hammered in dock, steaming in an opposite direction at sea. This latter cause of deviation is called sub-permanent magnetism. The horizontal directive force on the needle on board is nearly always less than on land, sometimes much less, whilst in armour-plated ships it ranges from ·8 to ·2 when the directive force on land = 1·0. If the ship be inclined to starboard or to port additional deviation will be observed, reaching a maximum on north and south points, decreasing to zero on the east and west points. Each ship has its own magnetic character, but there are certain conditions which are common to vessels of the same type.

Instead of observing the deviation solely for the purposes of correcting the indications of the compass when disturbed by the iron of the ship, the practice is to subject all deviations to mathematical analysis with a view to their mechanical correction. The whole of the deviations when the ship is upright may be expressed nearly by five co-efficients, A, B, C, D, E. Of these A is a deviation constant in amount for every direction of the ship's head. B has reference to horizontal forces acting in a longitudinal direction in the ship, and caused partly by the permanent magnetism of hard iron, partly by vertical induction in vertical soft iron either before or abaft the compass. C has reference to forces acting in a transverse direction, and caused by hard iron. D is due to transient induction in horizontal soft iron, the direction of which passes continuously under or over the compass. E is due to transient induction in horizontal soft iron unsymmetrically placed with regard to the compass. When data of this character have been obtained the compass deviations may be mechanically corrected to within 1°—always adhering to the principle that "like cures like." Thus the part of B caused by the permanent magnetism of hard iron must be corrected by permanent magnets horizontally placed in a fore and aft direction; the other part caused by vertical soft iron by means of bars of vertical soft iron, called Flinders bars, before or abaft the compass. C is compensated by permanent magnets athwartships and horizontal; D by masses of soft iron on both sides of the compass, and generally in the form of cast-iron spheres, with their centres in the same horizontal plane as the needles; E is usually too small to require correction; A is fortunately rarely of any value, as it cannot be corrected. The deviation observed when the ship inclines to either side is due—(1) to hard iron acting vertically upwards or downwards; (2) to vertical soft iron immediately below the compass; (3) to vertical induction in horizontal soft iron when inclined. To compensate (1) vertical magnets are used; (3) is partly corrected by the soft iron correctors of D; (2) and the remaining part of (3) cannot be conveniently corrected for more than one geographical position at a time. Although a compass may thus be made practically correct for a given time and place, the

magnetism of the ship is liable to changes on changing her geographical position, and especially so when steaming at right angles or nearly so to the magnetic meridian, for then sub-permanent magnetism is developed in the hull. Some vessels are more liable to become sub-permanently magnetized than others, and as no corrector has been found for this source of deviation the navigator must determine its amount by observation. Hence, however carefully a compass may be placed and subsequently compensated, the mariner has no safety without constantly observing the bearings of the sun, stars, or distant terrestrial objects, to ascertain its deviation. The results of these observations are entered in a compass journal for future reference when fog or darkness prevails.

Every compass and corrector supplied to the ships of the Royal Navy is previously examined in detail at the Compass Observatory established by the Admiralty at Deptford. A trained observer acting under the superintendent of compasses is charged with this important work. The superintendent, who is a naval officer, is also charged with the investigation of the magnetic character of all H.M. ships, to point out the most suitable positions for the compasses when a ship is designed, and subsequently to keep himself informed of their behaviour from the time of the ship's first trial. A museum containing compasses of various types invented during the 19th century is attached to the Compass Observatory at Deptford.

The mariner's compass during the early part of the 19th century was still a very imperfect instrument, although numerous inventors had tried to improve it. In 1837 the Admiralty Compass Committee was appointed to make a scientific investigation of the subject, and propose a form of compass suitable alike for azimuth and steering purposes. The committee reported in July 1840, and after minor improvements by the makers the Admiralty compass, the card of which is shown in Figs. 1 and 2, was adopted by the Government. Until 1876, when Sir William Thomson introduced his patent compass, this compass was not only the regulation compass of the Royal Navy, but was largely used in foreign countries in the same or a modified form. The introduction of powerful engines causing serious vibration to compass cards of the Admiralty type, coupled with the prevailing desire for larger cards, the deviation of which could also be more conveniently compensated, led to the gradual introduction of the Thomson compass. Several important points were gained in the latter: the quadrantal deviation could be finally corrected for all latitudes; frictional error at the cap and pivot was reduced to a minimum, the average weight of the card being 200 grains; the long free vibrational period of the card was found to be favourable to its steadiness when the vessel was rolling. The first liquid compass used in England was invented by Francis Crow, of Faversham, in 1813. It is said that the idea of a liquid compass was suggested to Crow by the experience of the captain of a coasting vessel whose compass card was oscillating wildly until a sea broke on board filling the compass bowl, when the card became steady. Subsequent improvements were made by Dant, and especially by Ritchie, of Boston, U.S.A. In 1888 the form of liquid compass (Fig. 5) now solely used in torpedo boats and torpedo boat destroyers was introduced. It has also proved to be the most trustworthy compass under the shock of heavy gun fire at present available. The deflector is an instrument designed to enable an observer to reduce the deviations of the compass to an amount not exceeding 2° during fogs, or at any time when bearings of distant objects are not available. It is certain that if the directive forces on the north, east, south, and west points of a compass are equal, there can be no deviation. With the deflector any inequality in the directive force can be detected, and hence the power of equalizing the forces by the usual soft iron and magnet correctors. Several kinds of deflector have been invented, that of Lord Kelvin (Sir William Thomson) being the simplest, but Dr Waghorn's is also very effective. The use of the deflector is generally confined to experts.

*The Magnetism of Ships.*—In 1814 Flinders first showed (see Flinders's *Voyage*, vol. ii. appx. ii.) that the abnormal values of the variation observed in the wood-built ships of his day was due to deviation of the compass caused by the iron in the ship; that the deviation was zero when the ship's head was near the north and south points; that it attained its maximum on the east and west points, and varied as the sine of the azimuth of the ship's head reckoned from the zero points. He also described a method of correcting deviation by means of a bar of vertical iron so placed as to correct the deviation nearly in all latitudes. This bar, now known as a "Flinders bar," is still in general use. In 1820 Dr Young (see Brande's *Quarterly Journal*, 1820) investigated mathematically the magnetism of ships. In 1824 Professor Barlow introduced his correcting plate of *soft* iron. Trials in certain ships showed that their magnetism consisted partly of hard iron, and the use of the plate was abandoned. In 1835 Captain Johnson, R.N., showed from experiments in the iron steamship *Garry Owen* that the vessel acted on an external compass as a magnet. In 1838 Airy (Astronomer-Royal) magnetically examined the iron steamship *Rainbow* at Deptford, and from his mathematical investigations (see *Phil. Trans. R. S.*, 1839) deduced his method of correcting the compass by permanent magnets and soft iron, giving practical rules for the same in 1840. Airy's and Flinders's correctors form the basis of all compass correctors to this day. In 1838 Poisson published his *Memoir on the Deviation of the Compass caused by the Iron in a Vessel*. In this he gave equations resulting from the hypothesis that the magnetism of a ship is partly due to the permanent magnetism of hard iron and partly to the transient-induced magnetism of soft iron; that the latter is proportional to the intensity of the inducing force, and that the length of the needle is infinitesimally small compared to the distance of the surrounding iron. From Poisson's equations Archibald Smith deduced the formulæ given in the *Admiralty Manual for Deviations of the Compass* (1st ed., 1862), a work which has formed the basis of numerous other manuals since published in Great Britain and other countries. In view of the serious difficulties connected with the inclining of every ship, Smith's formulæ for ascertaining and providing for the correction of the heeling error with the ship upright continue to be of great value to safe navigation. In 1855 the Liverpool Compass Committee commenced its work of investigating the magnetism of ships of the mercantile marine, resulting in three reports to the Board of Trade, all of great value, the last being presented in 1861.

See articles on Magnetism of Ships and Deviations of the Compass, *Phil. Trans.* 1839–83, *Journal United Service Inst.* 1859–1889, *Trans. Nav. Archit.* 1860–61–62, *Report of Brit. Assoc.* 1862, *London Quarterly Rev.* 1865; also *Admiralty Manual*, edit. 1862–63–69–93–1900; and TOWSON'S *Practical Information on Deviations of the Compass*, 1886. (E. W. C.)

**Compensation.**—The term "Compensation" is applied in English law to a number of different forms of legal reparation, *e.g.*, to persons injured by felony, or—under the Riot (Damages) Act, 1886—to persons whose property has been stolen, destroyed, or injured by rioters. It is due, under the Agricultural Holdings Act, 1883, for agricultural improvements; and, under the Workmen's Compensation Act, 1897, to workmen, in respect of accidents in certain forms of employment. The word is, however, in its strict and most familiar sense, a *nomen juris* for the reparation or satisfaction made to the owners of property which is taken by the executive government or by local bodies or corporations, under statutory authority, for public purposes. There are two main legal theories on which such appropriation of private property is justified. The American may be taken as a representative illustration of the one, and the English of the other. Though not included in the definition of "eminent domain," the necessity for compensation is recognized as incidental to that power. The normal procedure is admirably described in Bouvier's *Law Dict.*, ed. Rawle, 1897, *s.v.* "Eminent Domain." According to the law of the United States, there resides in every sovereign State, either as a residuum of the proprietary rights which it creates or protects, or (which is the better opinion) as an incident of its sovereignty, power to take, without reference to the question of compensation, the property of its subjects for purposes of a public character. This power is called "Eminent Domain." In English law the only exact analogue to this doctrine is to be found in the prerogative right (which now exists chiefly in theory) of the Crown to expropriate the lands of subjects for the purposes of the defence of the realm (see *Attorney-General* v. *Tomline*, 1879, 12 Ch. D. 214). With that exception, the rule of English constitutional law is that the property of the citizen cannot be seized for purposes which are really "public" without a fair pecuniary

**Eminent domain.**

equivalent being given to him; and, as the money for such compensation must come from Parliament, the practical result is that the seizure can only be effected under legislative authority. An action for illegal interference with the property of the subject is not maintainable against officials of the Crown or Government sued in their official capacity or as an official body. But Crown or Government officials may be sued in their individual capacity for such interference, even if they acted with the authority of the Government (cp. *Raleigh* v. *Goschen*, 1898, 1 Ch. 73; 67 L. J. Ch. 59).

*Lands Clauses Acts.*—Down to 1845 every Act authorizing the purchase of lands had, in addition to a number of common form clauses, a variety of special clauses framed with a view to meeting the particular circumstances with which it dealt. In 1845, however, a statute based on the recommendations of a select committee, appointed in the preceding year, was passed; the object being to diminish the bulk of the special Acts, and to introduce uniformity into Private Bill legislation by classifying the common form clauses, embodying them in general statutes, and enabling them to be incorporated into the special statutes by reference. The statute by which this change was initiated was the Lands Clauses Consolidation Act, 1845; and the policy has been continued by a series of later statutes which, together with the Act of 1845, are now grouped under the generic title of "The Lands Clauses Acts."

The public purposes for which lands are taken are threefold. Certain public departments, such as the War Office and the Admiralty, may acquire lands for national purposes. Local authorities are enabled to exercise similar powers for an enormous variety of municipal purposes, *e.g.*, the housing of the working classes, the improvement of towns, elementary and technical education. Lastly, the promoters of public undertakings of a commercial character, such as railways and harbours, carry on their operations under statutes in which the provisions of the Lands Clauses Acts are incorporated.

Lands may be taken under the Lands Clauses Acts either by agreement or compulsorily. The first step in the proceedings is a "notice to treat," or intimation by the promoters of their readiness to purchase the land, coupled with a demand for particulars as to the estate and the interests in it. The landowner on whom the notice is served may meet it by agreeing to sell, and the terms may then be settled by consent of the parties themselves, or by arbitration, if they decide to have recourse to that mode of adjusting the difficulty. If the property claimed is a house, or other building or manufactory, the owner has a statutory right to require the promoters by a counter-notice to take the whole, even although a part would serve their purpose. This rule, however, is, in modern Acts, often modified by special clauses. On receipt of the counter-notice the promoters must either assent to the requirement contained in it, or abandon their notice to treat. On the other hand, if the landowner fails within twenty-one days after receipt of the notice to treat to give the particulars which it requires, the promoters may proceed to exercise their compulsory powers and obtain assessment of the compensation to be paid. As a general rule, it is a condition precedent to the exercise of these powers by a company that the capital of the undertaking should be fully subscribed. Compensation, under the Lands Clauses Acts, is assessed in four different modes:—(1) by justices, where the claim does not exceed £50, or a claimant who has no greater interest than that of a tenant for a year, or from year to year, is required to give up possession before the expiration of his tenancy; (2) by arbitration (*a*) when the claim exceeds £50, and the claimant desires arbitration, and the interest is not a yearly tenancy, (*b*) when the amount has been ascertained by a surveyor, and the claimant is dissatisfied, (*c*) when superfluous lands are to be sold, and the parties and the promoters cannot agree as to the price; lands become "superfluous" if taken compulsorily on an erroneous estimate of the area needed, or if part only was needed and the owner compelled the promoters under the power above mentioned to take the whole, or in cases of abandonment; (3) by a jury, when the claim exceeds £50, and (*a*) the claimant does not signify his desire for arbitration, or no award has been made within the prescribed time, or (*b*) the claimant applies in writing for trial by jury; (4) by surveyors, nominated by justices, where the owner is under disability, or does not appear at the appointed time, or the claim is in respect of commonable rights, and a committee has not been appointed to treat with the promoters.

Promoters are not allowed without consent of the owner to enter upon lands which are the subject of proceedings under the Lands Clauses Acts, except for the purpose of making a survey, unless they have executed a statutory bond and made a deposit, at the Law Courts Branch of the Bank of England, as security for the performance of the conditions of the bond.

*Measure of Value.*—(1) Where land is taken, the basis on which compensation is assessed is the commercial value of the land to the owner at the date of the notice to treat. Potential value may be taken into account, and also goodwill of the property in a business. This rule, however, excludes any consideration of the principle of "betterment," according to which promoters would be allowed to set off against an owner's claim for compensation any enhancement of the value of his land by the use of the land taken by the promoters. Statutory recognition has been given to this principle in some of the American states and in some British colonies (*e.g.*, Victoria, &c.); and in England public bodies have been empowered in local Acts to recoup themselves for their outlay by receiving from the owners of premises and lands part of the enhanced value created by local improvements. [See Browne and Allan, *Compensation*, 1896, pp. 121, 683; and the report of a select committee of the House of Lords on the subject, *ib.* p. 684; and the London County Council (Tower Bridge, Southern Approach) Act, 1894.] (2) Where land, although not taken, is "injuriously affected" by the works of the promoters, compensation is payable for loss or damage resulting from any act, legalized by the promoters' statutory powers, which would otherwise have been actionable, or caused by the execution (not the use) of the works authorized by the undertaking.

***Betterment.***

(A. W. R.)

**Compiègne,** chief town of arrondissement, department of Oise, France, 37 miles east of Beauvais, on railway from Paris. The famous castle of Compiègne now serves as a museum, and contains an important collection of Cambodian and Gallo-Roman antiquities. A monument to Joan of Arc was erected in 1880. In the vicinity are important sugar-mills. Population (1881), 11,116; (1891), 11,877; (1896), 12,380; (1901), 16,503.

**Compressed Air.** See POWER, TRANSMISSION OF (PNEUMATIC).

**Concarneau,** a seaport and railway station,

France, department of Finistère, arrondissement of Quimper, 14 miles south-east of that town. The town occupies a very picturesque situation. The old portion stands on an island, and is surrounded by ramparts, parts of which date from the 15th century. It is an important centre of the sardine and mackerel fisheries, in which in 1899, 555 boats with 2966 men were employed. Lobsters are also largely reared. Population (1881), 5006; (1896), 6343.

**Concepción,** a city in Chile, capital of a province and department of the same name, near the mouth of the Bio-Bio, in 36° 49′ 37″ S. lat. and 73° 06′ W. long., 355 miles south of Santiago. Its altitude above the sea is 40 feet. Its population in 1895 was 39,837, and in 1898 it was 51,781. It is connected with the rest of the country by three lines of railway. It is an episcopal see, has a public school for boys, one for girls, an agricultural school, a seminary, and various other establishments. It publishes four newspapers. It is the principal commercial centre of Southern Chile, large quantities of wheat, flour, and wool being exported from it, through Talcahuano.

**Concepción,** or **Villa Concepción,** the principal city in the northern part of Paraguay, with a population, including its suburbs, of 15,000, 125 miles north-north-east of Asunción, and about 345 feet above sea-level. It has a national college, two public schools, a custom-house, a good harbour, a large market, two banks, a sub-department of the Agricultural Bank, a post office, street railway, and telephone company. It is the point whence most of the yerba maté is exported, and to which importation is made direct from all countries. Across the river is the English missionary station, the territory of which extends many miles into the interior, among the Indians.

**Concord,** a town and village of Middlesex county, Massachusetts, U.S.A., in the north-eastern part of the state, on the Boston and Maine and the Fitchburg (now a part of the Boston and Maine) Railways. Besides its distinction in revolutionary history, the town is known as the home of Emerson, Hawthorne, Thoreau, and other literary men. Population (1880), 3922; 1890, 4427; (1900), 5652.

**Concord,** capital of Merrimac county, New Hampshire, U.S.A., and of the state. It is situated in the southern part of the state, in 43° 12′ N. lat. and 71° 30′ W. long., at an altitude of 252 feet, on Merrimac river, which here is not navigable, but furnishes excellent water-power. The city has an area of 64 square miles, and is on the Boston and Maine Railway. Population (1880), 13,843; (1890), 17,004; (1900), 19,632.

**Concord,** capital of Cabarrus county, North Carolina, U.S.A., in the Piedmont region, on the Rocky river, and on the Southern Railway. Population (1890), 4339; (1900), 7910, including 1789 negroes.

**Condensation of Gases.**—If the volume of a gas continually decreases at a constant temperature, for which an increasing pressure is required, two cases may occur:—(1) The volume may continue to be homogeneously filled. (2) If the substance is contained in a certain volume, and if the pressure has a certain value, the substance may divide into two different phases, each of which is again homogeneous. The value of the temperature T decides which case will occur. The temperature which is the limit above which the space will always be homogeneously filled, and below which the substance divides into two phases, is called the *critical temperature* of the substance. It differs greatly for different substances, and if we represent it by $T_c$, the condition for the condensation of a gas is that T must be below $T_c$. If the substance is divided into two phases two different cases may occur. The denser phase may be either a liquid or a solid. The limiting temperature for these two cases, at which the division into three phases may occur, is called the *triple point*. Let us represent it by $T_3$; if the term "condensation of gases" is taken in the sense of "liquefaction of gases"—which is usually done—the condition for condensation is $T_c > T > T_3$. The opinion sometimes held that for all substances $T_3$ is the same fraction of T (the value being about $\frac{1}{2}$), has decidedly not been rigorously confirmed. Nor is this to be expected on account of the very different form of crystallization which the solid state presents. Thus for $CO_2$, for which $T_c = 304°$ on the absolute scale, and for which we may put $T_3 = 216°$, this fraction is about 0·7; for water it descends down to 0·42, and for other substances it may be still lower.

**Critical temperature.**

If we confine ourselves to temperatures between $T_c$ and $T_3$ the gas will pass into a liquid if the pressure is sufficiently increased. When the formation of liquid sets in we call the gas a *saturated vapour*. If the decrease of volume is continued the gas pressure remains constant till all the vapour has passed into liquid. The invariability of the properties of the phases is in close connexion with the invariability of the pressure (called *maximum tension*). Throughout the course of the process of condensation these properties remain unchanged, provided the temperature remain constant; only the relative quantity of the two phases changes. Until all the gas has passed into liquid a further decrease of volume will not require increase of pressure. But as soon as the liquefaction is complete a slight decrease of volume will require a great increase of pressure, liquids being but slightly compressible.

The pressure required to condense a gas varies with the temperature, becoming higher as the temperature rises. The highest pressure will therefore be found at $T_c$ and the lowest at $T_3$. We shall represent the pressure at $T_c$ by $p_c$. It is called the *critical pressure*. The pressure at $T_3$ we shall represent by $p_3$. It is called the *pressure of the triple point*. The values of $T_c$ and $p_c$ for different substances will be found at the end of this article. The values of $T_3$ and $p_3$ are accurately known only for a few substances. As a rule $p_3$ is small, though occasionally it is greater than 1 atmosphere. This is the case with $CO_2$, and we may in general expect it if the value of $T_3/T_c$ is large. In this case there can only be a question of a real boiling-point (under the normal pressure) if the liquid can be supercooled.

**Critical pressure.**

We may find the value of the pressure of the saturated vapour for each T in a geometrical way by drawing in the theoretical isothermal a straight line parallel to the $v$ axis in such a way, that $\int_{v_1}^{v_2} p dv$ will have the same value whether the straight line or the theoretical isothermal is followed. This construction, given by Maxwell, may be considered as a result of the application of the general rules for co-existing equilibrium, which we owe to Willard Gibbs. The construction derived from the rules of Gibbs is as follows:—Construe the free energy at a constant temperature, *i.e.*, the quantity $-\int p dv$ as ordinate, if the abscissa represents $v$, and determine the inclination of the double tangent. Another construction derived from the rules of Gibbs might be expressed as follows:—Construe the value of $pv - \int p dv$ as ordinate, the abscissa representing $p$, and determine the point of intersection of two of the three branches of this curve.

As an approximate, half-empirical formula for the calculation of the pressure, $-\log \frac{p}{p_c} = f\left(\frac{T_c - T}{T}\right)$ may be used.

It would follow from the law of corresponding states that in this formula the value of $f$ is the same for all substances, the molecules of which do not associate to form larger molecule-complexes. In fact, for a great many substances, we find a value for $f$, which differs but little from 3, *e.g.*, ether, $CO_2$, benzene, benzene derivatives, chloric ethyl, ethane, &c. As the chemical structure of these substances differs greatly, and association, if it takes place, must largely depend upon the structure of the molecule, we conclude from this approximate equality that the fact of this value of $f$ being equal to about 3 is characteristic for normal substances in which, consequently, association is excluded. Substances known to associate, such as organic acids and alcohols, have a sensibly higher value of $f$. Thus M. Estreicher (Cracow, 1896) calculates that for fluor-benzene $f$ varies between 3·07 and 2·94; for ether between 3·0 and 3·1; but for water between 3·2 and 3·33, and for methyl alcohol between 3·65 and 3·84, &c. For isobutyl alcohol $f$ even rises above 4. It is, however, remarkable that for oxygen $f$ has been found almost invariably equal to 2·47 from Olszewski's observations, a value which is appreciably smaller than 3. This fact makes us again seriously doubt the correctness of the supposition that $f=3$ is a characteristic for non-association.

It is a general rule that the volume of saturated vapour decreases when the temperature is raised, while that of the co-existing liquid increases. We know only one exception to this rule, and that is the volume of water below 4° C. If we call the liquid volume $v_l$, and the vapour $v_v$, $v_v - v_l$ decreases if the temperature rises, and becomes zero at $T_c$. The limiting value, to which $v_l$ and $v_v$ converge at $T_c$, is called the *critical volume*, and we shall represent it by $v_c$.

***Critical volume.***

According to the law of corresponding states the values both of $v_l/v_c$ and $v_v/v_c$ must be the same for all substances, if $T/T_c$ has been taken equal for them all. According to the investigations of Sydney Young, this holds good with a high degree of approximation for a long series of substances. Important deviations from this rule for the values of $v_v/v_l$ are only found for those substances in which the existence of association has already been discovered by other methods. Since the lowest value of T, for which investigations on $v_l$ and $v_v$ may be made, is the value of $T_3$; and since $T_3/T_c$, as has been observed above, is not the same for all substances, we cannot expect the smallest value of $v_l/v_c$ to be the same for all substances. But for low values of T, viz., such as are near $T_3$, the influence of the temperature on the volume is but slight, and therefore we are not far from the truth, if for normal substances we take the minimum value of $v/v_c$ as being equal for all normal substances, and put it at about $\frac{1}{3}$. Moreover, the influence of the polymerization (association) on the liquid volume appears to be small, so that we may even attribute the value $\frac{1}{3}$ to substances which are not normal. The value of $v_v/v_c$ at $T=T_3$ differs widely for different substances. If we take $p_3$ so low that the law of Boyle-Gay-Lussac may be applied, we can calculate $v_3/v_c$ by means of the formula $\frac{p_3 v_3}{T_3}=k\frac{p_c v_c}{T_c}$, provided $k$ be known. According to the observations of Sydney Young this factor has proved to be 3·77 for normal substances. In consequence $\frac{v_3}{v_c}=3{\cdot}77\,\frac{p_c}{p_3}\frac{T_3}{T_c}$. A similar formula, but with another value of $k$, may be given for associating substances, provided the saturated vapour does not contain any complex molecules. But if it does, as is the case with acetic acid, we must also know the degree of association. It can, however, only be found by measuring the volume itself.

Matthias has remarked that the following relation exists between the densities of the saturated vapour and of the co-existing liquid:—

***Rule of the rectilinear diameter.***

$$\rho_l + \rho_v = 2\rho_c\left\{1 + a\left(1 - \frac{T}{T_c}\right)\right\},$$

and that, accordingly, the curve which represents the densities at different temperatures possesses a rectilinear diameter. According to the law of corresponding states, $a$ would be the same for all substances. Many substances, indeed, actually appear to have a rectilinear diameter, and the value of $a$ appears approximatively to be the same. In a *Mémoire présenté à la société royale à Liège*, 15th June 1899, Matthias gives a list of some twenty substances for which $a$ has a value lying between 0·95 and 1·05. It had been already observed by Sydney Young that $a$ is not perfectly constant even for normal substances. For associating substances the diameter is not rectilinear. Whether the value of $a$, near 1, may serve as a characteristic for normal substances is rendered doubtful by the fact that for nitrogen $a$ is found equal to 0·6813, and for oxygen to 0·8. At $T=T_c/2$, the formula of Matthias, if $\rho_v$ be neglected with respect to $\rho_l$, gives the value $2+a$ for $\rho_l/\rho_c$.

The heat required to convert a molecular quantity of liquid coexisting with vapour into saturated vapour at the same temperature is called *molecular latent heat*. It decreases with the rise of the temperature, because at a higher temperature the liquid has already expanded, and because the vapour into which it has to be converted is denser.

***Latent heat.***

At the critical temperature it is equal to zero on account of the identity of the liquid and the gaseous states. If we call the molecular weight $m$ and the latent heat per unit of weight $r$, then, according to the law of corresponding states, $mr/T$ is the same for all normal substances, provided the temperatures are corresponding. According to Trouton the value of $mr/T$ is the same for all substances if we take for T the boiling-point. As the boiling-points under the pressure of one atmosphere are generally not equal fractions of $T_c$, the two theorems are not identical; but as the values of $p_c$ for many substances do not differ so much as to make the ratios of the boiling-points under the pressure of one atmosphere differ greatly from the ratios of $T_c$, an approximate confirmation of the law of Trouton may be compatible with an approximate confirmation of the consequence of the law of corresponding states. If we take the term boiling-point in a more general sense, and put T in the law of Trouton to represent the boiling-point under an arbitrary equal pressure, we may take the pressure equal to $p_c$ for a certain substance. For this substance $mr/T$ would be equal to zero, and the values of $mr/T$ would no longer show a trace of equality. At present direct trustworthy investigations about the value of $r$ for different substances are wanting; hence the question whether as to the quantity $mr/T$ the substances are to be divided into normal and associating ones cannot be answered. Let us divide the latent heat into heat necessary for internal work and heat necessary for external work. Let $r'$ represent the former of these two quantities, then:—

$$r = r' + p(v_v - v_l).$$

Then the same remark holds good for $mr'/T$ as has been made for $mr/T$. The ratio between $r$ and that part that is necessary for external work is given in the formula,

$$\frac{r}{p(v_v - v_l)} = \frac{T}{p}\frac{dp}{dT}.$$

By making use of the approximate formula for the vapour tension: $-$ Nap. log. $\frac{p}{p_c}=f'\left(\frac{T_c - T}{T}\right)$, we find

$$\frac{r}{p(v_v - v_l)} = f'\frac{T_c}{T}.$$

At $T = T_c$ we find for this ratio $f'$, a value which for normal substances is equal to $3/0{\cdot}4343 = 7$. At the critical temperature the quantities $r$ and $v_v - v_l$ are both equal to 0, but they have a finite ratio. As we may equate $p(v_v - v_l)$ with $pv_v = RT$ at very low temperatures, we get, if we take into consideration that R expressed in calories is equal to $2/m$, the value $2f'T_c = 14T_c$ as limiting value for $mr$ for normal substances. This value for $mr$ has, however, merely the character of a rough approximation — especially since the factor $f'$ is not perfectly constant.

All the phenomena which accompany the condensation of gases into liquids may be explained by the supposition, that the condition of aggregation which we call liquid differs only in quantity, and not in quality, from that which we call gas. We imagine a gas to consist of separate molecules of a certain mass $\mu$, having a certain velocity depending on the temperature. This velocity is distributed according to the law of probabilities, and furnishes a quantity of *vis viva* proportional to the temperature. We must attribute extension to the molecules, and they will attract one another with a force which quickly decreases with the distance. Even those suppositions which reduce molecules to centra of forces, like that of Maxwell, lead us to the result that the molecules behave in mutual collisions as if they had extension—an extension which in this case is not constant, but determined by the law of repulsion in the collision, the law of the distribution, and the value of the velocities. In order to explain capillary phenomena it was assumed so early as Laplace, that between the molecules of the same substance an attraction exists which quickly decreases with the distance. That this attraction is found in gases too is proved by the fall which occurs in the temperature of a gas that is expanded without performing external work. We are still perfectly in the dark as to the cause of this attraction, and opinion differs greatly as to its dependence on the distance. Nor is this knowledge necessary in order to find the influence of the attraction, for a homogeneous state, on the value of the external pressure which is required to keep the moving molecules at a certain volume (T being given). We may, viz., assume either in the strict sense, or as a first approximation, that the influence of the attraction is quite equal to a pressure which is proportional to the square of the density. Though this molecular pressure is small for gases, yet it will be considerable for the great densities of liquids, and calculation shows that we may estimate it at more than 1000 atmos., possibly increasing up to 10,000. We may now make the same supposition for a liquid as for a gas, and imagine it to consist of molecules, which for non-associating substances are the same as those of the rarefied vapour; these, if T is the same, have the same mean *vis viva* as the vapour molecules, but are more closely massed together. Starting from this supposition and all its consequences, the author of this article has derived the following formula, which would hold both for the liquid state and for the gaseous state :—

***Nature of a liquid.***

$$\left(p + \frac{a}{v^2}\right)(v - b) = RT.$$

It follows from this deduction that for the rarefied gaseous state $b$ would be four times the volume of the molecules, but that for greater densities the factor 4 would decrease. If we represent the volume of the molecules by $\beta$, the quantity $b$ will be found to have the following form :—

$$b = 4\beta\left\{1 - \gamma_1\left(\frac{4\beta}{v}\right) + \gamma_2\left(\frac{4\beta}{v}\right)^2 \text{ \&c.}\right\}$$

Only two of the successive coefficients $\gamma_1$, $\gamma_2$, &c., have been worked out, for the determination requires very lengthy calculations, and has not even led to definitive results (Boltzmann, *Proc. Royal Acad. Amsterdam*, March 1899). The latter formula supposes the molecules to be rigid spheres of invariable size. If the molecules are things which are compressible, another formula for $b$ is found, which is different according to the number of atoms in the molecule (*Proc. Royal Acad. Amsterdam*, 1900–1). If we keep the value of $a$ and $b$ constant, the given equation will not completely represent the net of isothermals of a substance. Yet even in this form it is sufficient as to the principal features. From it we may argue to the existence of a critical temperature, to a minimum value of the product $pv$, to the law of corresponding states, &c. Some of the numerical results to which it leads, however, have not been confirmed by experience. Thus it would follow from the given equation that $\frac{p_c v_c}{T_c} = \frac{3}{8}\frac{pv}{T}$, if the value of $v$ is taken so great that the gaseous laws may be applied, whereas Sydney Young has found $1/3{\cdot}77$ for a number of substances instead of the factor $3/8$. Again it follows from the given equation, that if $a$ is thought to be independent of the temperature, $\frac{T_c}{p_c}\left(\frac{dp}{dT}\right)_c = 4$, whereas for a number of substances a value is found for it which is near 7. If we assume with Clausius that $a$ depends on the temperature, and has a value $a'\frac{273}{T}$, we find $\frac{T_c}{p_c}\left(\frac{dp}{dT}\right)_c = 7$.

That the accurate knowledge of the equation of state is of the highest importance is universally acknowledged, because in connexion with the results of thermodynamics it will enable us to explain all phenomena relating to ponderable matter. This general conviction is shown by the numerous efforts made to complete or modify the given equation, or to replace it by another, for instance, by Clausius, Tait, Amagat, Boltzmann, Jäger, Dieterici, Galitzine, Rose Innes, and Reinganum.

If we hold to the supposition that the molecules in the gaseous and the liquid state are the same—which we may call the supposition of the identity of the two conditions of aggregation—then the heat which is given out by the condensation at constant T is due to the potential energy lost in consequence of the coming closer of the molecules which attract each other, and then it is equal to $a\left(\frac{1}{v_l} - \frac{1}{v_v}\right)$. If $a$ should be a function of the temperature, it follows from thermodynamics that it would be equal to $\left(a - T\frac{da}{dT}\right)\left(\frac{1}{v_l} - \frac{1}{v_v}\right)$. Not only in the case of liquid and gas, but always when the volume is diminished, a quantity of heat is given out equal to $a\left(\frac{1}{v_1} - \frac{1}{v_2}\right)$ or $\left(a - T\frac{da}{dT}\right)\left(\frac{1}{v_1} - \frac{1}{v_2}\right)$.

If, however, when the volume is diminished at a given temperature, and also during the transition from the gaseous to the liquid state, combination into larger molecule-complexes takes place, the total internal heat may be considered as the sum of that which is caused by the combination of the molecules into greater molecule-complexes and by their approach towards each other. We have the simplest case of possible greater complexity when two molecules combine to one. From the course of the changes in the density of the vapour we assume that this occurs, *e.g.*, with $NO_2$ and acetic acid, and the somewhat close agreement of the observed density of the vapour with that which is calculated from the hypothesis of such an association to double-molecules, makes this supposition almost a certainty. In

***Associating substances.***

such cases the molecules in the much denser liquid state must therefore be considered as double-molecules, either completely so or in a variable degree depending on the temperature. The given equation of state cannot hold for such substances. Even though we assume that $a$ and $b$ are not modified by the formation of double-molecules, yet RT is modified, and since it is proportional to the number of the molecules, it is diminished by the combination. The laws found for normal substances will, therefore, not hold for such associating substances. Accordingly for substances for which we have already found an anormal density of the vapour, we cannot expect the general laws for the liquid state, which have been treated above, to hold good without modification, and in many respects such substances will therefore not follow the law of corresponding states. There are, however, also substances of which the anormal density of vapour has not been stated, and which yet cannot be ranged under this law, *e.g.*, water and alcohols. The most natural thing, of course, is to ascribe the deviation of these substances, as of the others, to the fact that the molecules of the liquid are polymerized. In this case we have to account for the following circumstance, that whereas for $NO_2$ and acetic acid in the state of saturated vapour the degree of association increases if the temperature falls, the reverse must take place for water and alcohols. Such a difference may be accounted for by the difference in the quantity of heat released by the polymerization to double-molecules or larger molecule-complexes. The quantity of heat given out when two molecules fall together may be calculated for $NO_2$, and acetic acid from the formula of Gibbs for the density of vapour, and it proves to be very considerable. With this the following fact is closely connected. If in the $pv$ diagram, starting from a point indicating the state of saturated vapour, a geometrical locus is drawn of the points which have the same degree of association, this curve, which passes towards isothermals of higher T if the volume diminishes, requires for the same change in T a greater diminution of volume than is indicated by the border-curve. For water and alcohols this geometrical locus will be found on the other side of the border-curve, and the polymerization heat will be small, *i.e.*, smaller than the latent heat. For substances with a small polymerization heat the degree of association will continually decrease if we move along the border-curve on the side of the saturated vapour in the direction towards lower T. With this, it is perfectly compatible that for such substances the saturated vapour, *e.g.*, under the pressure of one atmosphere, should show an almost normal density. Saturated vapour of water at 100° has a density which seems nearly 4 per cent. greater than the theoretical one, an amount which is greater than can be ascribed to the deviation from the gas-laws. For the relation between $v$, T, and $x$, if $x$ represents the fraction of the number of double-molecules, the following formula has been found (*Moleculartheorie Zeitschrift Ph. Ch.*, 1890, Leipzig):

$$\log \frac{x(v-b)}{(1-x)^2} = 2\frac{E_1 - E_2}{R_1 T} + C,$$

from which

$$\frac{T}{v-b}\left(\frac{dv}{dT}\right)_x = -2\frac{E_1 - E_2}{R_1 T}$$

which may elucidate what precedes.

**Condensation of substances with low $T_c$.** By far the majority of substances have a value of $T_c$ above the ordinary temperature, and diminution of volume (increase of pressure) is sufficient to condense such gaseous substances into liquids. If $T_c$ is but little above the ordinary temperature, a great increase of pressure is in general required to effect condensation. Substances for which $T_c$ is much higher than the ordinary temperature $T_0$, *e.g.*, $T_c > {}^5/_3 T_0$, occur as liquids, even without increase of pressure; that is, at the pressure of one atmosphere. The value ${}^5/_3$ is to be considered as only a mean value, because of the inequality of $p_c$. The substances for which $T_c$ is smaller than the ordinary temperature are but few in number. Taking the temperature of melting ice as a limit, these gases are in successive order: $CH_4$, NO, $O_2$, CO, $N_2$, and $H_2$ (the recently-discovered gases are left out of account). If these gases are compressed at 0° centigrade they do not show a trace of liquefaction, and therefore they were long known under the name of "permanent gases." The discovery, however, of the critical temperature carried the conviction that these substances would not be "permanent gases" if they were compressed at much lower T. Hence the problem arose how "low temperatures" were to be brought about. Considered from a general point of view the means to attain this end may be described as follows: we must make use of the above-mentioned circumstance that heat disappears when a substance expands, either with or without performing external work. According as this heat is derived from the substance itself which is to be condensed, or from the substance which is used as a means of cooling, we may divide the methods for condensing the so-called permanent gases into two principal groups.

**Liquids as means of cooling.** In order to use a liquid as a cooling bath it must be placed in a vacuum, and it must be possible to keep the pressure of the vapour in that space at a small value. According to the boiling-law, the temperature of the liquid must descend to that at which the maximum tension of the vapour is equal to the pressure which reigns on the surface of the liquid. If the vapour, either by means of absorption or by an air-pump, is exhausted from the space, the temperature of the liquid and that of the space itself depend upon the value of the pressure which finally prevails in the space. From a practical point of view the value of $T_3$ may be regarded as the limit to which the temperature falls. It is true that if the air is exhausted to the utmost possible extent, the temperature may fall still lower, but when the substance has become solid, a further diminution of the pressure in the space is of little advantage. At any rate, as a solid body evaporates only on the surface, and solid gases are bad conductors of heat, further cooling will only take place very slowly, and will scarcely neutralize the influx of heat. If the pressure $p_3$ is very small, it is perhaps practically impossible to reach $T_3$; if so, $T_3$ in the following lines will represent the temperature practically attainable. There is thus for every gas a limit below which it is not to be cooled further, at least not in this way. If, however, we can find another gas for which the critical temperature is sufficiently above $T_3$ of the first chosen gas, and if it is converted into a liquid by cooling with the first gas, and then treated in the same way as the first gas, it may in its turn be cooled down to $(T_3)_2$. Going on in this way, continually lower temperatures may be attained, and it would be possible to condense all gases, provided the difference of the successive critical temperatures of two gases fulfils certain conditions. If the ratio of the absolute critical temperatures for two gases, which succeed one another in the series, should be sensibly greater than 2, the value of $T_3$ for the first gas is not, or not sufficiently, below the $T_c$ of the second gas. This is the case when one of the gases is nitrogen, on which hydrogen would follow as second gas. Generally, however, we shall take atmospheric air instead of nitrogen. Though this mixture of $N_2$ and $O_2$ will show other critical phenomena than a simple substance, yet we shall continue to speak of a $T_c$ for air, which is given at −140° C., and for which, there-

fore, $T_c$ amounts to 133° absolute. The lowest T which may be expected for air in a highly rarefied space may be evaluated at 60° absolute—a value which is higher than the $T_c$ for hydrogen. Without new contrivances it would, accordingly, not be possible to reach the critical temperature of $H_2$. The method by which we try to obtain successively lower temperatures by making use of successive gases is called the "cascade method." It is not self-evident that by sufficiently diminishing the pressure on a liquid, it may be cooled to such a degree that the temperature will be lowered to $T_3$, if the initial temperature was equal to $T_c$, or but little below it, and we can even predict with certainty that this will not be the case for all substances. It is possible, too, that long before the triple point is reached the whole liquid will have evaporated. The most favourable conditions will, of course, be attained when the influx of heat is reduced to a minimum. As a limiting case we imagine the process to be adiabatic. Now the question has become, Will an isentropic line, which starts from a point of the border-curve on the side of the liquid not far from the critical point, remain throughout its descending course in the heterogeneous region, or will it leave the region on the side of the vapour? As early as 1878 the author of this article (*Verslagen Kon. Akad. Amsterdam*) pointed out that the former may be expected to be the case only for substances for which $c_p/c_v$ is large, and the latter for those for which it is small; in other words, the former will take place for substances the molecules of which contain few atoms, and the latter for substances the molecules of which contain many atoms. Ether is an example of the latter class, and if we say that the quantity $h$ (specific heat of the saturated vapour) for ether is found to be positive, we state the same thing in other words. It is not necessary to prove this theorem further here, as the molecules of the gases under consideration contain only two atoms and the total evaporation of the liquid is not to be feared.

In the practical application of this cascade-method some variation is found in the gases chosen for the successive stages. Thus chloric methyl, ethylene, and oxygen are used in the cryogenic laboratory of Leyden, while Professor Dewar has used air as the last term. Carbonic acid is not to be recommended on account of the comparatively high value of $T_3$. In order to prevent loss of gas a system of "circulation" is employed. This method of obtaining low temperatures is decidedly laborious, and requires very intricate apparatus, but it has the great advantage that very *constant* low temperatures may be obtained, and can be regulated arbitrarily within pretty wide limits.

***Cooling by expansion.***

In order to lower the temperature of a substance down to $T_3$, it is not always necessary to convert it first into the liquid state by means of another substance, as was assumed in the last method for obtaining low temperatures. Its own expansion is sufficient, provided the initial condition be properly chosen, and provided we take care, even more than in the former method, that there is no influx of heat. Those conditions being fulfilled, we may, simply by adiabatic expansion, not only lower the temperature of some substances down to $T_3$, but also convert them into the liquid state. This is especially the case with substances the molecules of which contain few atoms.

Let us imagine the whole net of isothermals for homogeneous phases drawn in a *pv* diagram, and in it the border-curve. Within this border-curve, as in the heterogeneous region, the theoretical part of every isothermal must be replaced by a straight line. The isothermals may therefore be divided into two groups, viz., those which keep outside the heterogeneous region, and those which cross this region. Hence an isothermal, belonging to the latter group, enters the heterogeneous region on the liquid side, and leaves it at the same level on the vapour side. Let us imagine in the same way all the isentropic curves drawn for homogeneous states. Their form resembles that of isothermals in so far as they show a maximum and a minimum, if the entropy-constant is below a certain value, while if it is above this value, both the maximum and the minimum disappear, the isentropic line in a certain point having at the same time $\frac{dp}{dv}$ and $\frac{d^2p}{dv^2}=0$ for this particular value of the constant. This point, which we might call the critical point of the isentropic lines, lies in the heterogeneous region, and therefore cannot be realized, since as soon as an isentropic curve enters this region its theoretical part will be replaced by an empiric part. If an isentropic curve crosses the heterogeneous region, the point where it enters this region must, just as for the isothermals, be connected with the point where it leaves the region by another curve. When $c_p/c_v=k$ (the limiting value of $c_p/c_v$ for infinite rarefaction is meant) approaches unity, the isentropic curves approach the isothermals and *vice versâ*. In the same way the critical point of the isentropic curves comes nearer to that of the isothermals. And if $k$ is not much greater than 1, *e.g.*, $k<1{\cdot}08$, the following property of the isothermals is also preserved, viz., that an isentropic curve, which enters the heterogeneous region on the side of the liquid, leaves it again on the side of the vapour, not of course at the same level, but at a lower point. If, however, $k$ is greater, and particularly if it is so great as it is with molecules of one or two atoms, an isentropic curve, which enters on the side of the liquid, however far prolonged, always remains within the heterogeneous region. But in this case all isentropic curves, if sufficiently prolonged, will enter the heterogeneous region. Every isentropic curve has one point of intersection with the border-curve, but only a small group intersect the border-curve in three points, two of which are to be found not far from the top of the border-curve and on the side of the vapour. Whether the sign of $h$ (specific heat of the saturated vapour) is negative or positive, is closely connected with the preceding facts. For substances having $k$ great, $h$ will be negative if T is low, positive if T rises, while it will change its sign again before $T_c$ is reached. The values of T, at which change of sign takes place, depend on $k$. The law of corresponding states holds good for this value of T for all substances which have the same value of $k$.

Now the gases which were considered as permanent are exactly those for which $k$ has a high value. From this it would follow that every adiabatic expansion, provided it be sufficiently continued, will bring such substances into the heterogeneous region, *i.e.*, they can be condensed by adiabatic expansion. But since the final pressure must not fall below a certain limit, determined by experimental convenience, and since the quantity which passes into the liquid state must remain a fraction as large as possible, and since the expansion never can take place in such a manner that no heat is given out by the walls or the surroundings, it is best to choose the initial condition in such a way that the isentropic curve of this point cuts the border-curve in a point on the side of the liquid, lying as low as possible. The border-curve being rather broad at the top, there are many isentropic curves which penetrate the heterogeneous region under a pressure which differs but little from $p_c$. Availing himself of this property, Olszewski has determined $p_c$ for hydrogen at 20 atmospheres. Isentropic curves, which lie on the right and on the left of this group, will show a point of condensation at a lower pressure. Olszewski has investigated this for those lying on the right, but not for those on the left.

From the equation of state $\left(p+\frac{a}{v^2}\right)(v-b)=\mathrm{RT}$, the equation of the isentropic curve follows as $\left(p+\frac{a}{v^2}\right)(v-b)^k=\mathrm{C}$, and from this we may deduce $\mathrm{T}(v-b)^{k-1}=\mathrm{C}'$. This latter relation shows in how high a degree the cooling depends on the amount by which $k$ surpasses unity, the change in $v-b$ being the same.

What has been said concerning the relative position of the border-curve and the isentropic curve may be easily tested for points of the border-curve which represent rarefied gaseous states, in the following way. Following the border-curve we found before $f\frac{\mathrm{T}_c}{\mathrm{T}}$ for the value of $\frac{\mathrm{T}}{p}\frac{dp}{d\mathrm{T}}$. Following the isentropic curve the value of $\frac{\mathrm{T}}{p}\frac{dp}{d\mathrm{T}}$ is equal to $\frac{k}{k-1}$. If $\frac{k}{k-1}<f\frac{\mathrm{T}_c}{\mathrm{T}}$, the isentropic curve rises more steeply than the border-curve. If we take $f=7$ and choose the value of $\mathrm{T}_c/2$ for T—a temperature at which the saturated vapour may be considered to follow the gas-laws—then $k/k-1=14$, or $k=1\cdot07$ would be the limiting value for the two cases. At any rate $k=1\cdot41$ is great enough to fulfil the condition, even for other values of T. Pictet has availed himself of this adiabatic expansion for condensing many permanent gases, and it must also be used when, in the cascade method, $\mathrm{T}_3$ of one of the gases lies above $\mathrm{T}_c$ of the next.

A third method of condensing the permanent gases is applied in Linde's apparatus for liquefying air. Under a high pressure $p_1$ a current of gas is conducted through a narrow spiral, returning through another spiral which surrounds the first. Between the end of the first spiral and the beginning of the second the current of gas is reduced to a much lower pressure $p_2$ by passing through a tap with a fine orifice. On account of the expansion resulting from this sudden decrease of pressure, the temperature of the gas, and consequently of the two spirals, falls sensibly. If this process is repeated with another current of gas, this current, having been cooled in the inner spiral, will be cooled still further, and the temperature of the two spirals will become still lower. If the pressures $p_1$ and $p_2$ remain constant the cooling will increase with the lowering of the temperature. In Linde's apparatus this cycle is repeated over and over again, and after some time (about two or three hours) it becomes possible to draw off liquid air.

***Linde's apparatus.***

The cooling which is the consequence of such a decrease of pressure was experimentally determined in 1854 by Lord Kelvin (then Professor W. Thomson) and Joule, who represent the result of their experiments in the formula

$$\mathrm{T}_1-\mathrm{T}_2=\gamma\frac{p_1-p_2}{\mathrm{T}^2}.$$

In their experiments $p_2$ was always 1 atmosphere, and the amount of $p_1$ was not large. It would, therefore, be certainly wrong, even though for a small difference in pressure the empiric formula might be approximately correct, without closer investigation to make use of it for the differences of pressure used in Linde's apparatus, where $p_1=200$ and $p_2=18$ atmospheres. For the existence of a most favourable value of $p_1$ is in contradiction with the formula, since it would follow from it that $\mathrm{T}_1-\mathrm{T}_2$ would always increase with the increase of $p_1$. Nor would it be right to regard as the cause for the existence of this most favourable value of $p_1$ the fact that the heat produced in the compression of the expanded gas, and therefore $p_1/p_2$, must be kept as small as possible, for the simple reason that the heat is produced in quite another part of the apparatus, and might be neutralized in different ways.

Closer examination of the process shows that if $p_2$ is given, a most favourable value of $p_1$ must exist for the cooling itself. If $p_1$ is taken still higher, the cooling decreases again, and we might take a value for $p_1$ for which the cooling would be zero, or even negative.

If we call the energy per unit of weight $\epsilon$ and the specific volume $v$, the following equation holds :—

$$\epsilon_1+p_1v_1-p_2v_2=\epsilon_2,$$

or

$$\epsilon_1+p_1v_1=\epsilon_2+p_2v_2.$$

According to the symbols chosen by Gibbs, $\chi_1=\chi_2$.

As $\chi$ is determined by $\mathrm{T}_1$ and $p_1$, and $\chi_2$ by $\mathrm{T}_2$ and $p_2$, we obtain, if we take $\mathrm{T}_1$ and $p_2$ as being constant,

$$\left(\frac{\delta\chi_1}{\delta p_1}\right)_{\mathrm{T}_1}dp_1=\left(\frac{\delta\chi_2}{\delta\mathrm{T}_2}\right)_{p_2}d\mathrm{T}_2.$$

If $\mathrm{T}_2$ is to have a minimum value, we have

$$\left(\frac{\delta\chi_1}{\delta p_1}\right)_{\mathrm{T}_1}=0,\ \text{or}\ \left(\frac{\delta\chi_1}{\delta v_1}\right)_{\mathrm{T}_1}=0.$$

From this follows

$$\left(\frac{\delta\epsilon_1}{\delta v_1}\right)_{\mathrm{T}_1}+\left[\frac{\delta(p_1v_1)}{\delta v_1}\right]_{\mathrm{T}_1}=0.$$

As $\left(\frac{\delta\epsilon_1}{\delta v_1}\right)_{\mathrm{T}}$ is positive, we shall have to take for the maximum cooling such a pressure that the product $pv$ decreases with $v$, viz., a pressure larger than that at which $pv$ has the minimum value. By means of the equation of state mentioned already, we find for the value of the specific volume that gives the greatest cooling, the formula

$$\frac{\mathrm{RT}_1b}{(v_1-b)^2}=\frac{2a}{v_1^2},$$

and for the value of the pressure

$$p_1=27p_c\left[1-\sqrt{\frac{4}{27}\frac{\mathrm{T}_1}{\mathrm{T}_c}}\right]\left[3\sqrt{\frac{4}{27}\frac{\mathrm{T}_1}{\mathrm{T}_c}}-1\right].$$

If we take the value $2\mathrm{T}_c$ for $\mathrm{T}_1$, as we may approximately for air when we begin to work with the apparatus, we find for $p_1$ about $8p_c$, or more than 300 atmospheres. If we take $\mathrm{T}_1=\mathrm{T}_c$, as we may at the end of the process, we find $p_1=2.5p_c$, or 100 atmospheres. The constant pressure which has been found the most favourable in Linde's apparatus is a mean of the two calculated pressures. In a theoretically perfect apparatus we ought, therefore, to be able to regulate $p_1$ according to the temperature in the inner spiral.

The critical temperatures and pressures of the permanent gases are given in the following table, the former being expressed on the absolute scale and the latter in atmospheres :—

| | $\mathrm{T}_c$ | $p_c$ | | $\mathrm{T}_c$ | $p_c$ |
|---|---|---|---|---|---|
| $CH_4$ | 191·2° | 55 | CO | 133·5° | 35·5 |
| NO | 179·5° | 71·2 | $N_2$ | 127° | 35 |
| $O_2$ | 155° | 50 | Air | 133° | 39 |
| Argon | 152° | 50·6 | $H_2$ | 40° | 20 |

According to Professor Dewar the critical temperature of $H_2$ is about 32° absolute, and the critical pressure about 15 atmospheres (*Proc. Roy. Inst. Great Britain*, 7th June 1899). (See also LIQUID GASES.)

(J. D. V. D. W.)

**Conduction of Heat.**—The mathematical theory of conduction of heat was developed early in the 19th century by Fourier and other workers, and was brought to so high a pitch of excellence that little has remained for later writers to add to this department of the subject. In fact, for a considerable period, the term "theory of heat" was practically synonymous with the mathematical treatment of conduction. A summary of Fourier's analysis will be found in HEAT (*Ency. Brit.* vol. xi.), and the theory need not be considered in detail here, except in so far as it is required for the definition and explanation of fundamental terms. The main object of the present article is to describe more recent work, and to discuss experimental difficulties and methods of measurement.

1. *Mechanism of Conduction.*—Conduction of heat implies transmission by contact from one body to another or between contiguous particles of the same body, but does not include transference of heat by the motion of masses or streams of matter from one place to another. This is termed *Convection* (see RADIATION), and is most im-

portant in the case of liquids and gases owing to their mobility. Conduction, however, is generally understood to include diffusion of heat in fluids due to the agitation of the ultimate molecules, which is really molecular convection. It also includes diffusion of heat by internal radiation, which must occur in transparent substances. In measuring conduction of heat in fluids, it is possible to some extent to eliminate the effects of molar convection or mixing, but it would not be possible to distinguish between diffusion, or internal radiation, and conduction. Some writers have supposed that the ultimate atoms are conductors, and that heat is transferred through them when they are in contact. This, however, is merely transferring the properties of matter in bulk to its molecules. It is much more probable that heat is really the kinetic energy of motion of the molecules, and is passed on from one to another by collisions. Further, if we adopt Weber's hypothesis of electric atoms, capable of diffusing through metallic bodies and conductors of electricity, but capable of vibration only in non-conductors, it is possible that the ultimate mechanism of conduction may be reduced in all cases to that of diffusion in metallic bodies or internal radiation in dielectrics. The high conductivity of metals is then explained by the small mass and high velocity of diffusion of these electric atoms. Assuming the kinetic energy of an electric atom at any temperature to be equal to that of a gaseous molecule, its velocity, on Professor J. J. Thomson's estimate of the mass, must be upwards of forty times that of the hydrogen molecule.

2. *Law of Conduction.*—The experimental Law of Conduction, which forms the basis of the mathematical theory, was established in a qualitative manner by Fourier and the early experimentalists. Although it is seldom explicitly stated as an experimental law, it should really be regarded in this light, and may be briefly worded as follows:—"*The rate of transmission of heat by conduction is proportional to the temperature gradient.*"

The "rate of transmission of heat" is here understood to mean the quantity of heat transferred in unit time through unit area of cross-section of the substance, the unit area being taken perpendicular to the lines of flow. It is clear that the quantity transferred in any case must be jointly proportional to the area and the time. The "gradient of temperature" is the fall of temperature in degrees per unit length along the lines of flow. The *Thermal Conductivity* of the substance is the constant ratio of the rate of transmission to the temperature gradient. To take the simple case of the "wall" or flat plate considered by Fourier for the definition of Thermal Conductivity, suppose that a quantity of heat $Q$ passes in the time $T$ through an area $A$ of a plate of conductivity $k$ and thickness $x$, the sides of which are constantly maintained at temperatures $\theta'$ and $\theta''$. The rate of transmission of heat is $Q/AT$, and the temperature gradient, supposed uniform, is $(\theta' - \theta'')/x$, so that the law of conduction leads at once to the equation—

$$Q/AT = k(\theta' - \theta'')/x = kd\theta/dx. \qquad (1)$$

This relation applies accurately to the case of the steady flow of heat in parallel straight lines through a homogeneous and isotropic solid, the isothermal surfaces, or surfaces of equal temperature, being planes perpendicular to the lines of flow. If the flow is steady, and the temperature of each point of the body invariable, the rate of transmission must be everywhere the same. If the gradient is not uniform, its value may be denoted by $d\theta/dx$. In the steady state, the product $kd\theta/dx$ must be constant, or the gradient must vary inversely as the conductivity, if the latter is a function of $\theta$ or $x$. One of the simplest illustrations of the rectilinear flow of heat is the steady outflow through the upper strata of the earth's crust, which may be considered practically plane in this connexion. This outflow of heat necessitates a rise of temperature with increase of depth. The corresponding gradient is of the order of 1° C. in 100 feet, but varies inversely with the conductivity of the strata at different depths.

3. *Variable State.*—A different type of problem is presented in those cases in which the temperature at each point varies with the time, as is the case near the surface of the soil with variations in the external conditions between day and night or summer and winter. The flow of heat may still be linear if the horizontal layers of the soil are of uniform composition, but the quantity flowing through each layer is no longer the same. Part of the heat is used up in changing the temperature of the successive layers. In this case it is generally more convenient to consider as unit of heat the thermal capacity $c$ of unit volume, or that quantity which would produce a rise of one degree of temperature in unit volume of the soil or substance considered. If $Q$ is expressed in terms of this unit in equation, (1) it is necesssary to divide by $c$, or to replace $k$ on the right hand side by the ratio $k/c$. This ratio determines the rate of diffusion of temperature, and is called the *Thermometric Conductivity* or, more shortly, the *Diffusivity.* The velocity of propagation of temperature waves will be the same under similar conditions in two substances which possess the same diffusivity, although they may differ in conductivity.

4. *Emissivity.*—Fourier defined another constant expressing the rate of loss of heat at a bounding surface per degree of difference of temperature between the surface of the body and its surroundings. This he called the *External Conductivity*, but the term *Emissivity* is more convenient. Taking Newton's law of cooling, that the rate of loss of heat is simply proportional to the excess of temperature, the emissivity would be independent of the temperature. This is generally assumed to be the case in mathematical problems, but the assumption is admissible only in rough work, or if the temperature difference is small. The emissivity really depends on every variety of condition, such as the size, shape, and position of the surface, as well as on its nature; it varies with the rate of cooling, as well as with the temperature excess, and it is generally so difficult to calculate, or to treat in any simple manner, that it forms the greatest source of uncertainty in all experimental investigations in which it occurs.

5. *Experimental Methods.* — Measurements of conductivity present peculiar difficulties on account of the variety of quantities to be observed, the slowness of the process of conduction, the impossibility of isolating a quantity of heat, and the difficulty of exactly realizing the theoretical conditions of the problem. The most important methods may be classified roughly under three heads—(1) Steady Flow, (2) Variable Flow, (3) Electrical. The methods of the first class may be further subdivided according to the form of apparatus employed. The following are some of the special cases which have been utilized experimentally:—

6. *The "Wall" or Plate Method.*—This method endeavours to realize the conditions of equation, (1) namely, uniform rectilinear flow. Theoretically this requires an infinite plate, or a perfect heat insulator, so that the lateral flow can be prevented or rendered negligible. This condition can generally be satisfied with sufficient approximation with plates of reasonable dimensions. To find the conductivity, it is necessary to measure all the quantities which occur in equation (1) to a similar order of accuracy. The area $A$ from which the heat is collected need not be the whole surface of the plate, but a measured central area where the flow is most nearly uniform. This variety is known as

the "Guard-Ring" method, but it is generally rather difficult to determine the effective area of the ring. There is little difficulty in measuring the time of flow, provided that it is not too short. The measurement of the temperature gradient in the plate generally presents the greatest difficulties. If the plate is thin, it is necessary to measure the thickness with great care, and it is necessary to assume that the temperatures of the surfaces are the same as those of the media with which they are in contact, since there is no room to insert thermometers in the plate itself. This assumption does not present serious errors in the case of bad conductors, such as glass or wood, but has given rise to large mistakes in the case of metals. The conductivities of thin slices of crystals have been measured by Lees by pressing them between plane amalgamated surfaces of metal. This gives very good contact, and the conductivity of the metal being more than 100 times that of the crystal, the temperature of the surface is determinate.

In applying the plate method to the determination of the conductivity of iron, Hall has recently succeeded in overcoming this difficulty by coating the plate thickly with copper on both sides, and deducing the difference of temperature between the two surfaces of junction of the iron and the copper from the thermo-electric force observed by means of a number of fine copper wires attached to the copper coatings at different points of the disc. The advantage of the thermo-junction for this purpose is that the distance between the surfaces of which the temperature-difference is measured, is very exactly defined. The disadvantage is that the thermo-electric force is very small, about ten-millionths of a volt per degree, so that a small accidental disturbance may produce a serious error with a difference of temperature of only 1° between the junctions. The chief uncertainty in applying this method appears to have arisen from variations of temperature at different parts of the surface, due to inequalities in the heating or cooling effect of the stream of water flowing over the surfaces. Uniformity of temperature could only be secured by using a high velocity of flow, or violent stirring. Neither of these methods could be applied in this experiment. The temperatures indicated by the different pairs of wires differed by as much as 10 per cent., but the mean of the whole would probably give a fair average. The heat transmitted was measured by observing the flow of water (about 20 gm./sec.), and the rise of temperature (about 0·5° C.) in one of the streams. The results appear to be entitled to considerable weight on account of the directness of the method, and the full consideration of possible errors. They were as follows:—

Cast-iron, $k=0{\cdot}1490$ C.G.S. at 30° C., temp. coef. $-0{\cdot}00075$.
Pure iron, $k=0{\cdot}1530$ at 30° C., temp. coef. $-0{\cdot}0003$.

The discs were 10 cms. in diam., and nearly 2 cms. thick, plated with copper to a thickness of 2 mm. The cast-iron contained about 3·5 per cent. of carbon, 1·4 per cent. of silicon, and 0·5 per cent. of manganese.

7. *Tube Method.*—If the inside of a glass tube is exposed to steam, and the outside to a rapid current of water, or *vice versâ*, the temperatures of the surfaces of the glass may be taken to be very approximately equal to those of the water and steam, which may be easily observed. If the thickness of the glass is small compared with the diameter of the tube, say one-tenth, equation (1) may be applied with sufficient approximation, the area $A$ being taken as the mean between the internal and external surfaces. It is necessary that the thickness $x$ should be approximately uniform. Its mean value may be determined most satisfactorily from the weight and the density. The heat $Q$ transmitted in a given time $T$ may be deduced from an observation of the rise of temperature of the water, and the amount which passes in the interval. This is one of the simplest of all methods in practice, but it involves the measurement of several different quantities, some of which are difficult to observe accurately. The employment of the tube form evades one of the chief difficulties of the plate method, namely, the uncertainty of the flow at the boundary of the area considered. Unfortunately the method cannot be applied to good conductors, like the metals, because the difference of temperature between the surfaces may be five or ten times less than that between the water and steam in contact with them, even if the water is energetically stirred.

8. *Cylinder Method.*—A variation of the tube method, which can be applied to metals and good conductors, depends on the employment of a thick cylinder with a small axial hole in place of a thin tube. The actual temperature of the metal itself can then be observed by inserting thermometers or thermo-couples at measured distances from the centre. This method has been applied by Callendar and Nicolson (*Brit. Assoc. Report*, 1897), to cylinders of cast-iron and mild steel, 5 inches in diam. and 2 feet long, with one-inch axial holes. The surface of the central hole was heated by steam under pressure, and the total flow of heat was determined by observing the amount of steam condensed in a given time. The outside of the cylinder was cooled by water circulating in a spiral screw thread in a very narrow space with high velocity under a pressure of 120 ℔ per square inch. A very uniform surface temperature was thus obtained. The lines of flow in this method are radial. The isothermal surfaces are coaxial cylinders. The areas of successive surfaces vary as their radii, hence the rate of transmission $Q/AT$ varies inversely as the radius $r$, and is $Q/2\pi rlT$, if $l$ is the length of the cylinder, and $Q$ the total heat, calculated from the condensation of steam observed in a time $T$. The outward gradient is $d\theta/dr$, and is negative if the central hole is heated. We have therefore the equation—

$$-kd\theta/dr=Q/2\pi rlT. \tag{2}$$

If $k$ is constant the solution is evidently, $\theta=a\log r+b$, where $a=-Q/2\pi klT$, and $b$ and $k$ are determined from the known values of the temperatures observed at any two distances from the axis. This gives an average value of the conductivity over the range, but it is better to observe the temperatures at three distances, and to assume $k$ to be a linear function of the temperature, in which case the solution of the equation is still very simple, namely—

$$\theta+e\theta^2/2=a\log r+b, \tag{3}$$

where $e$ is the temperature-coefficient of the conductivity. The chief difficulty in this method lay in determining the effective distances of the bulbs of the thermometers from the axis of the cylinder, and in ensuring uniformity of flow of heat along different radii. For these reasons the temperature-coefficient of the conductivity could not be determined satisfactorily on this particular form of apparatus, but the mean results were probably trustworthy to 1 or 2 per cent. They refer to a temperature of about 60° C., and were—

Cast-iron, 0·109; mild steel, 0·119, C.G.S.

These are much smaller than Hall's results. The cast-iron contained nearly 3 per cent. each of silicon and graphite, and 1 per cent. each of phosphorus and manganese. The steel contained less than 1 per cent. of foreign materials. The low value for the cast-iron was confirmed by two entirely different methods given below.

9. *Forbes's Bar Method.*—Observation of the steady distribution of temperature along a bar heated at one end was very early employed by Fourier, Despretz, and others for the comparison of conductivities. It is the most convenient method in the case of good conductors on account of the great facilities which it permits for the measurement of the temperature gradient at different points, but it has the disadvantage that the results depend almost entirely on a knowledge of the external heat loss or emissivity, or, in comparative experiments, on the assumption that it is the same in different cases. The method of Forbes (in which the conductivity is deduced from the steady distribution of temperature on the assumption that the rate of loss of heat at each point of the bar is the same as that observed in an auxiliary experiment in which a short bar of the same kind is set to cool under conditions which are supposed to be identical), is too well known to require detailed description, but a consideration of its weak points is very instructive, and the results have been most remarkably misunderstood and misquoted. The method gives directly, not $k$, but $k/c$. Tait repeated Forbes's experiments, using one of the same iron bars, and endeavoured to correct his results for the variation of the specific heat $c$. Mitchell, under Tait's direction, repeated the experiments with the same bar nickel-plated, correcting the thermometers for stem-exposure, and also varying the conditions by cooling one end, so as to obtain a steeper gradient. The results of Forbes, Tait, and Mitchell, on the same bar, and Mitchell's two results by different methods, are quoted by Landoldt and Börnstein as if they referred to different metals. This is not very surprising, if the values in the following table are compared:—

TABLE I. *Thermal Conductivity of Forbes's Iron Bar D (1·25 Inches Square). C.G.S. Units.*

| Temp. Cent. | Uncorrected for Variation of c. | | | | Corrected for Variation of c. | | | |
|---|---|---|---|---|---|---|---|---|
| | Forbes. | Tait. | Mitchell: Cooled. | | Forbes. | Tait. | Mitchell: Cooled. | |
| 0° | ·207 | ·231 | ·197 | ·178 | ·213 | ·238 | ·203 | ·184 |
| 100° | ·157 | ·198 | ·178 | ·190 | ·168 | ·212 | ·190 | ·197 |
| 200° | ·136 | ·176 | ·160 | ·181 | ·152 | ·196 | ·178 | ·210 |

The variation of $c$ is uncertain. The values credited to Forbes are those given by Everett on Balfour Stewart's authority. Tait gives different figures. The values given in the column headed "cooled" are those found by Mitchell with one end of the bar cooled. The discrepancies are chiefly due to the error of the

fundamental assumption that the rate of cooling is the same at the same temperature under the very different conditions existing in the two parts of the experiment. They are also partly caused by the large uncertainties of the corrections, especially those of the mercury thermometers under the peculiar conditions of the experiment. The results of Forbes are interesting historically as having been the first approximately correct determinations of conductivity in absolute value. The same method was applied by R. W. Stewart (*Phil. Trans.*, 1892), with the substitution of thermo-couples (following Wiedemann) for mercury thermometers. This avoids the very uncertain correction for stem-exposure, but it is doubtful how far an insulated couple, inserted in a hole in the bar, may be trusted to attain the true temperature. The other uncertainties of the method remain. R. W. Stewart found for pure iron, $k = \cdot 175\ (1 - \cdot 0015\ t)$ C.G.S. Hall using a similar method found for cast-iron at 50° C. the value ·105, but considers the method very uncertain as ordinarily practised.

10. *Calorimetric Bar Method.*—To avoid the uncertainties of surface loss of heat, it is necessary to reduce it to the rank of a small correction by employing a large bar and protecting it from loss of heat. The heat transmitted should be measured calorimetrically, and not in terms of the uncertain emissivity. The apparatus shown in Fig. 1 was constructed by Callendar and

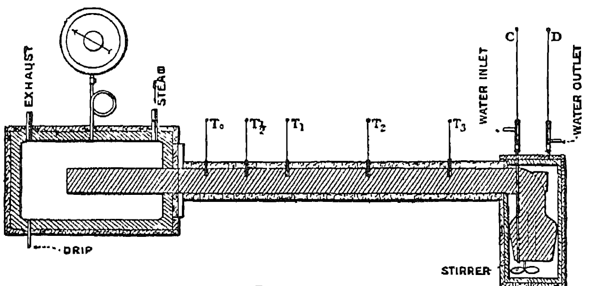

Fig. 1.

Nicolson with this object. The bar was a special sample of cast-iron, the conductivity of which was required for some experiments on the condensation of steam (*Proc. Inst. C.E.*, 1898). It had a diameter of 4 inches, and a length of 4 feet between the heater and the calorimeter. The emissivity was reduced to one quarter by lagging the bar like a steam-pipe to a thickness of 1 inch. The heating vessel could be maintained at a steady temperature by high-pressure steam. The other end was maintained at a temperature near that of the air by a steady stream of water flowing through a well-lagged vessel surrounding the bar. The heat transmitted was measured by observing the difference of temperature between the inflow and the outflow, and the weight of water which passed in a given time. The gradient near the entrance to the calorimeter was deduced from observations with five thermometers at suitable intervals along the bar. The results obtained by this method at a temperature of 40° C., varied from ·116 to ·118 C.G.S. from observations on different days, and were probably more accurate than those obtained by the cylinder method. The same apparatus was employed in another series of experiments by Ångström's method described below.

11. *Guard-Ring Method.*—This may be regarded as a variety of the plate method, but is more particularly applicable to good conductors, which require the use of a thick plate, so that the temperature of the metal may be observed at different points inside it. Berget (*Journ. Phys.* vii. p. 503, 1888) has applied this method directly to mercury, and has determined the conductivity of some other metals by comparison with mercury. In the case of mercury he employed a column in a glass tube 13 mm. in diam. surrounded by a guard cylinder of the same height, but 6 to 12 cm. in diam. The mean section of the inner column was carefully determined by weighing, and found to be 1·403 sq. cm. The top of the mercury was heated by steam, the lower end rested on an iron plate cooled by ice. The temperature at different heights was measured by iron wires forming thermo-junctions with the mercury in the inner tube. The heat-flow through the central column amounted to about 7·5 calories in 54 seconds, and was measured by continuing the tube through the iron plate into the bulb of a Bunsen ice calorimeter, and observing with a chronometer to a fifth of a second the time taken by the mercury to contract through a given number of divisions. The calorimeter tube was calibrated by a thread of mercury weighing 19 milligrams, which occupied eighty-five divisions. The contraction corresponding to the melting of 1 gramme of ice was assumed to be ·0906 c.c., and was taken as being equivalent to 79 calories (1 calorie = 15·59 mgrm. Hg.). The chief uncertainty of this method is the area from which the heat is collected, which probably exceeds that of the central column, owing to the disturbance of the linear flow by the projecting bulb of the calorimeter. This may partly account for the discrepancy in the following results:—

| | | | |
|---|---|---|---|
| Mercury, | $k = 0{\cdot}02015$ | C.G.S. | Berget. |
| ,, | $k = 0{\cdot}01479$ | ,, | Weber. |
| ,, | $k = 0{\cdot}0177$ | ,, | Ångstrom. |

12. *Variable-Flow Methods.*—In these methods the flow of heat is deduced from observations of the rate of change of temperature with time in a body exposed to known external or boundary conditions. No calorimetric observations are required, but the results are obtained in terms of the thermal capacity of unit volume $c$, and the measurements give the diffusivity $k/c$, instead of the calorimetric conductivity $k$. Since both $k$ and $c$ are generally variable with the temperature, and the mode of variation of either is often unknown, the results of these methods are generally less certain with regard to the actual flow of heat. As in the case of steady-flow methods, by far the simplest example to consider is that of the linear flow of heat in an infinite solid, which is most nearly realized in nature in the propagation of temperature waves in the surface of the soil. One of the best methods of studying the flow of heat in this case is to draw a series of curves showing the variations of temperature with depth in the soil for a series of consecutive days. The curves given in Fig. 2 were ob-

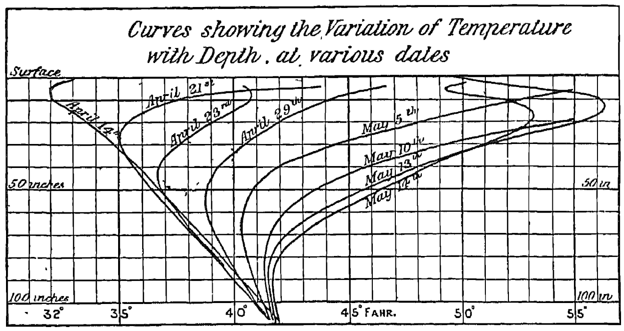

Fig. 2.

tained from the readings of a number of platinum thermometers buried in undisturbed soil in horizontal positions at M'Gill College, Montreal. The method of deducing the diffusivity from these curves is as follows:—

The total quantity of heat absorbed by the soil per unit area of surface between any two dates, and any two depths, $x'$ and $x''$, is equal to $c$ times the area included between the corresponding curves. This can be measured graphically without any knowledge of the law of variation of the surface temperature, or of the laws of propagation of heat waves. The quantity of heat absorbed by the stratum $(x'\ x'')$ in the interval considered can also be expressed in terms of the calorimetric conductivity $k$. The heat transmitted through the plane $x$ is equal per unit area of surface to the product of $k$ by the mean temperature gradient $(d\theta/dx)$ and the interval of time, $T - T'$. The mean temperature gradient is found by plotting the curves for each day from the daily observations. The heat absorbed is the difference of the quantities transmitted through the bounding planes of the stratum. We thus obtain the simple equation—

$$k'(d\theta'/dx') - k''(d\theta''/dx'') = c\ (\text{area between curves})/(T - T'), \quad (4)$$

by means of which the average value of the diffusivity $k/c$ can be found for any convenient interval of time, at different seasons of the year, in different states of the soil.

For the particular soil in question it was found that the diffusivity varied enormously with the degree of moisture, falling as low as ·0010 C.G.S. in the winter for the surface layers, which became extremely dry under the protection of the frozen ice and snow from December to March, but rising to an average of ·0060 to ·0070 in the spring and autumn. The greater part of the diffusion of heat was certainly due to the percolation of water. On some occasions, owing to the sudden melt-

ing of a surface layer of ice and snow, a large quantity of cold water, percolating rapidly, gave for a short time values of the diffusivity as high as ·0300. Excluding these exceptional cases, however, the variations of the diffusivity appeared to follow the variations of the seasons with considerable regularity in successive years. The presence of water in the soil always increased the value of $k/c$, and as it necessarily increased $c$, the increase of $k$ must have been greater than that of $k/c$.

13. *Periodic Flow of Heat.*—The above method is perfectly general, and can be applied in any case in which the requisite observations can be taken. A case of special interest and importance is that in which the flow is *periodic.* The general characteristics of such a flow are illustrated in Fig. 3, showing the propagation

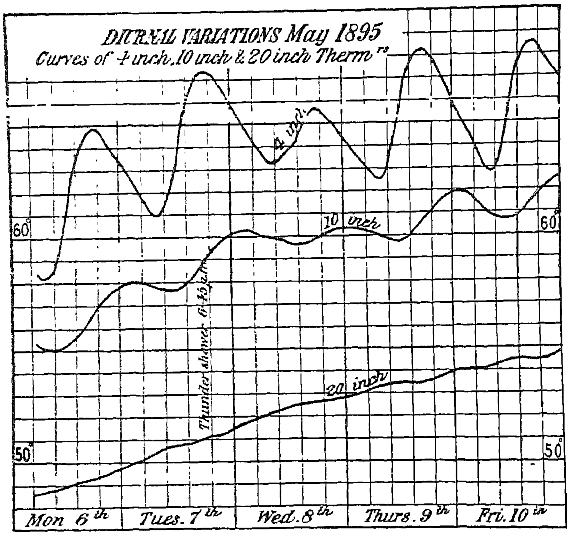

Fig. 3.

of temperature waves due to diurnal variations in the temperature of the surface. The daily range of temperature of the air and of the surface of the soil was about 20° F. On a sunny day, the temperature reached a maximum about 2 p.m., and a minimum about 5 a.m. As the waves were propagated downwards through the soil the amplitude rapidly diminished, so that at a depth of only 4 inches it was already reduced to about 6° F., and to less than 2° at 10 inches. At the same time, the epoch of maximum or minimum was retarded, about 4 hours at 4 inches, and nearly 12 hours at 10 inches, where the maximum temperature was reached between 1 and 2 a.m. The form of the wave was also changed. At 4 inches the rise was steeper than the fall, at 10 inches the reverse was the case. This is due to the fact that the components of shorter period are more rapidly propagated. For instance, the velocity of propagation of a wave having a period of a day is nearly twenty times as great as that of a wave with a period of one year, but on the other hand the penetration of the diurnal wave is nearly twenty times less, and the shorter waves die out more rapidly.

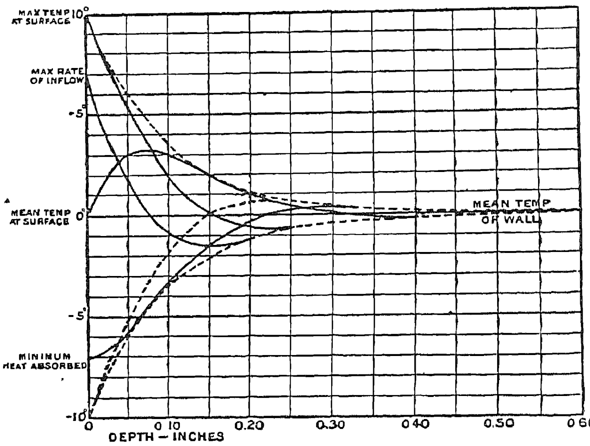
14. *A Simple-Harmonic or Sine Wave* is the only kind which is propagated without change of form. In treating mathematically the propagation of other kinds of waves, it is necessary to analyse them into their simple-harmonic components, which may be treated as being propagated independently. To illustrate the main features of the calculation, we may suppose that the surface is subject to a simple-harmonic cycle of temperature variation, so that the temperature at any time $t$ is given by an equation of the form—

$$\theta - \theta_0 = A \sin 2\pi nt = A \sin 2\pi t/T, \tag{5}$$

where $\theta_0$ is the mean temperature of the surface, $A$ the amplitude of the cycle, $n$ the frequency, and $T$ the period. In this simple case the temperature cycle at a depth $x$ is a precisely similar curve of the same period, but with the amplitude reduced in the proportion $e^{mx}$, and the phase retarded by the fraction $mx/2\pi$ of a cycle. The index-coefficient $m$ is $(\pi nc/k)^{\frac{1}{2}}$. The wave at a depth $x$ is represented analytically by the equation—

$$\theta - \theta_0 = Ae^{-mx} \sin (2\pi nt + mx). \tag{6}$$

A strictly periodic oscillation of this kind occurs in the working of a steam-engine, in which the walls of the cylinder are exposed to regular fluctuations of temperature with the admission and release of steam. The curves in Fig. 4 are drawn for a particular



Speed, 42 revolutions per minute; range, 20° at surface.

Fig. 4.

case, but they apply equally to the propagation of a simple-harmonic wave of any period in any substance changing only the scale on which they are drawn. The dotted boundary curves have the equation $\theta = \pm e^{-mx}$, and show the rate of diminution of the amplitude of the temperature oscillation with depth in the metal. The wave-length in Fig. 4 is 0·60 inch, at which depth the amplitude of the variation is reduced to less than one-five hundredth part ($e^{-2\pi}$) of that at the surface, so that for all practical purposes the oscillation may be neglected beyond one wave-length. At half a wave-length the amplitude is only 1/23rd of that at the surface. The wave-length in any case is $2\pi/m$.

The diffusivity can be deduced from observations at different depths $x'$ and $x''$, by observing the ratio of the amplitudes, which is $e^{m(x'-x'')}$ for a simple-harmonic wave. The values obtained in this way for waves having a period of one second and a wave-length of half an inch agreed very well with those obtained in the same cast-iron by Ångström's method (see below), with waves having a period of 1 hour and a length of 30 inches. This agreement was a very satisfactory test of the accuracy of the fundamental law of conduction, as the gradients and periods varied so widely in the two cases.

15. *Annual Variation.*—A similar method has frequently been applied to the study of variations of soil-temperatures by harmonic analysis of the annual waves. But the theory is not strictly applicable, as the phenomena are not accurately periodic, and the state of the soil is continually varying, and differs at different depths, particularly in regard to its degree of wetness. An additional difficulty arises in the case of observations made with long mercury thermometers buried in vertical holes, that the correction for the expansion of the liquid in the long stems is uncertain, and that the holes may serve as channels for percolation, and thus lead to exceptionally high values. The last error is best avoided by employing platinum thermometers buried horizontally. In any case results deduced from the annual wave must be expected to vary in different years according to the distribution of the rainfall, as the values represent averages depending chiefly on the diffusion of heat by percolating water. For this reason observations at different depths in the same locality often give very concordant results for the same period, as the total percolation and the average rate are necessarily nearly the same for the various strata, although

the actual degree of wetness of each may vary considerably. The following are a few typical values for sand or gravel deduced from the annual wave in different localities.—

TABLE II. *Diffusity of Sandy Soils. C.G.S. Units.*

| Observer. | Soil. | Locality. | Thermometer. | Diffusivity. |
|---|---|---|---|---|
| Kelvin, 1860 | Garden sand. | Edinburgh. | Mercury. | ·0087 |
| Neumann, 1863 | Sandy loam. | .. | ,, | ·0136 |
| Everett, 1860 | Gravel. | Greenwich. | ,, | ·0125 |
| Ångstrom, 1861 | Sandy clay. | Upsala. | ,, | ·0057 |
| ,, | ,, ,, | | ,, | ·0045 |
| Ångstrom | Coarse sand. | ,, | ,, | ·0094 |
| Rudberg | The same soil, place, and instruments reduced for different years. | | | ·0061 |
| Quetelet | | | | ·0074 |
| Callendar, 1895 | Garden sand. | Montreal. | Platinum. | ·0036 |
| Rambaut, 1900 | Gravel. | Oxford. | ,, | ·0074 |

The low value at Montreal is chiefly due to the absence of percolation during the winter. Rambaut's results were obtained with similar instruments similarly located, but he did not investigate the seasonal variations of diffusivity, or the effect of percolation. It is probable that the coarser soils, permitting more rapid percolation, would generally give higher results. In any case, it is evident that the transmission of heat by percolation would be much greater in porous soils and in the upper layers of the earth's crust than in the lower strata or in solid rocks. It is probable for this reason that the average conductivity of the earth's crust, as deduced from surface observations, is too large; and that estimates of the age of the earth based on such measurements are too low, and require to be raised; they would thereby be brought into better agreement with the conclusions of geologists derived from other lines of argument.

16. *Ångström's Method* consists in observing the propagation of heat waves in a bar, and is probably the most accurate method for measuring the diffusivity of a metal, since the conditions may be widely varied and the correction for external loss of heat can be made comparatively small. Owing, however, to the laborious nature of the observations and reductions, the method does not appear to have been seriously applied since its first invention, except in one solitary instance by the writer to the case of cast-iron (Fig. 1). The equation of the method is the same as that for the linear flow with the addition of a small term representing the radiation loss. The mathematical solution is given in the article HEAT (*Ency. Brit.* vol. xi.), assuming that $k$ and $c$ are both constants, and the coefficient of cooling also constant, over the range of the experiment. This is an admissible approximation if the range is small. The apparatus of Fig. 1 was designed for this method, and may serve to illustrate it. The steam pressure in the heater may be periodically varied by the gauge in such a manner as to produce an approximately simple harmonic oscillation of temperature at the hot end, while the cool end is kept at a steady temperature. The amplitudes and phases of the temperature waves at different points are observed by taking readings of the thermometers at regular intervals. In using mercury thermometers, it is best, as in the apparatus figured, to work on a large scale (4-inch bar) with waves of slow period, about 1 to 2 hours. Ångström endeavoured to find the variation of conductivity by this method, but he assumed $c$ to be the same for two different bars, and made no allowance for its variation with temperature. He thus found nearly the same rate of variation for the thermal as for the electric conductivity. His final results for copper and iron were as follows:—

$$\text{Copper, } k=0{\cdot}982\ (1-0{\cdot}00152\ \theta) \text{ assuming } c={\cdot}84476.$$
$$\text{Iron, } k=0{\cdot}1988\ (1-0{\cdot}00287\ \theta) \quad ,, \quad c={\cdot}88620.$$

Ångström's value for iron, when corrected for obvious numerical errors, and for the probable variation of $c$, becomes—

$$\text{Iron, } k=0{\cdot}164\ (1-0{\cdot}0013\ \theta),$$

but this is very doubtful as $c$ was not measured.

The experiments on cast-iron with the apparatus of Fig. 1 were varied by taking three different periods, 60, 90, and 120 minutes, and two distances, 6 inches and 12 inches, between the thermometers compared. In some experiments the bar was lagged with 1 inch of asbestos, but in others it was bare, the heat-loss being thus increased fourfold. In no case did this correction exceed 7 per cent. The extreme divergence of the resulting values of the diffusivity, including eight independent series of measurements on different days, was less than 1 per cent. Observations were taken at mean temperatures of 102° C. and 54° C., with the following results:—

$$\text{Cast-iron at } 102^\circ \text{ C., } k/c={\cdot}1296,\ c={\cdot}858,\ k={\cdot}1113$$
$$,, \quad ,, \quad 54^\circ \text{ C., } k/c={\cdot}1392,\ c={\cdot}823,\ k={\cdot}1144.$$

The variation of $c$ was determined by a special series of experiments. No allowance was made for the variation of density with temperature, or for the variation of the distance between the thermometers, owing to the expansion of the bar. Although this correction should be made if the definition were strictly followed, it is more convenient in practice to include the small effect of linear expansion in the temperature-coefficient in the case of solid bodies.

17. *Lorentz's Method.*—Neumann, Weber, Lorentz, and others have employed similar methods, depending on the observation of the rate of change of temperature at certain points of bars, rings, cylinders, cubes, or spheres. Some of these results have been widely quoted, but they are far from consistent, and it may be doubted whether the difficulties of observing rapidly varying temperatures have been duly appreciated in many cases. From an experimental point of view the most ingenious and complete method was that of Lorentz (*Wied. Ann.* xiii. p. 422, 1881). He deduced the variations of the mean temperature of a section of a bar from the sum $S$ of the E.M.F's. of a number of couples, inserted at suitable equal intervals $l$ and connected in series. The difference of the temperature gradients $D/l$ at the ends of the section was simultaneously obtained from the difference $D$ of the readings of a pair of couples at either end connected in opposition. The external heat-loss was eliminated by comparing observations taken at the same mean temperatures during heating and during cooling, assuming that the rate of loss of heat $f(S)$ would be the same in the two cases. Lorentz thus obtained the equations—

$$\text{Heating, } qk\ D/l=cql\ dS/dt+f(S).$$
$$\text{Cooling, } qk\ D'/l=cql\ dS'/dt'+f(S').$$
$$\text{Whence } k=cl^2(dS/dt-dS'/dt')/(D-D'). \qquad (7)$$

It may be questioned whether this assumption was justifiable, since the rate of change and the distribution of temperature were quite different in the two cases, in addition to the sign of the change itself. The chief difficulty, as usual, was the determination of the gradient, which depended on a difference of potential of the order of 20 microvolts between two junctions inserted in small holes 2 cms. apart in a bar 1·5 cms. in diameter. It was also tacitly assumed that the thermo-electric power of the couples for the gradient was the same as that of the couples for the mean temperature, although the temperatures were different. This might give rise to constant errors in the results. Owing to the difficulty of measuring the gradient, the order of divergence of individual observations averaged 2 or 3 per cent., but occasionally reached 5 or 10 per cent. The thermal conductivity was determined in the neighbourhood of 20° C. with a water jacket, and near 110° C. by the use of a steam jacket. The conductivity of the same bars was independently determined by the method of Forbes, employing an ingenious formula for the heat-loss in place of Newton's law. The results of this method differ 2 or 3 per cent. (in one case nearly 15 per cent.) from the preceding, but it is probably less accurate. The thermal capacity and electrical conductivity were measured at various temperatures on the same specimens of metal. Owing to the completeness of the recorded data, and the great experimental skill with which the research was conducted, the results are probably among the most valuable hitherto available. One important result, which might be regarded as established by this work, was that the ratio $k/k'$ of the thermal to the electrical conductivity, though nearly constant for the good conductors at any one temperature such as 0° C., increased with rise of temperature nearly in proportion to the absolute temperature. The value found for this ratio at 0° C. approximated to 1500 C.G.S. for the best conductors, but increased to 1800 or 2000 for bad conductors like German silver and antimony. It is clear, however, that this relation cannot be generally true, for the cast-iron mentioned in the last section had a specific resistance of 112,000 C.G.S. at 100° C., which would make the ratio $k/k'=12{,}500$. The increase of resistance with temperature was also very small, so that the ratio varied very little with temperature.

18. *Electrical Methods.*—There are two electrical methods which have been recently applied to the measurement of the conductivity of metals, (*a*) the resistance method, devised by the writer, and applied by him, and also by King and Duncan, (*b*) the thermo-electric method, devised by Kohlrausch, and applied by Jæger and Dieselhorst. Both methods depend on the observation of the steady

distribution of temperature in a bar or wire heated by an electric current. The advantage is that the quantities of heat are measured directly in absolute measure, in terms of the current, and that the results are independent of a knowledge of the specific heat. Incidentally it is possible to regulate the heat supply more perfectly than in other methods.

(a) In the practice of the resistance method, both ends of a short bar are kept at a steady temperature by means of solid copper blocks provided with a water circulation, and the whole is surrounded by a jacket at the same temperature, which is taken as the zero of reference. The bar is heated by a steady electric current, which may be adjusted so that the external loss of heat from the surface of the bar is compensated by the increase of resistance of the bar with rise of temperature. In this case the curve representing the distribution of temperature is a parabola, and the conductivity $k$ is deduced from the mean rise of temperature $(R-R^{\circ})/aR^{\circ}$ by observing the increase of resistance $R-R^{\circ}$ of the bar, and the current C. It is also necessary to measure the cross-section $q$, the length $l$, and the temperature-coefficient $a$ for the range of the experiment.

In the general case, the distribution of temperature is observed by means of a number of potential leads. The differential equation for the distribution of temperature in this case includes the majority of the methods already considered, and may be stated as follows. The heat generated by the current $C$ at a point $x$ where the temperature-excess is $\theta$ is equal per unit length and time ($t$) to that lost by conduction $-d(qkd\theta/dx)/dx$, and by radiation $hp\theta$ (emissivity $h$, perimeter $p$), together with that employed in raising the temperature $qcd\theta/dt$, and absorbed by the Thomson effect $sCd\theta/dx$. We thus obtain the equation—

$$C^2R_o(1+a\theta)/l = -d(qkd\theta/dx)/dx + hp\theta + qcd\theta/dt + sCd\theta/dx. \quad (8)$$

If $C=0$, this is the equation of Ångstrom's method. If $h$ also is zero, it becomes the equation of variable flow in the soil. If $d\theta/dt=0$, the equation represents the corresponding cases of steady flow. In the electrical method, observations of the variable flow are useful for finding the value of $c$ for the specimen, but are not otherwise required. The last term, representing the Thomson effect, is eliminated in the case of a bar cooled at *both* ends, since it is opposite in the two halves, but may be determined by observing the resistance of each half separately. If the current $C$ is chosen so that $C^2R_oa=hpl$, the external heat-loss is compensated by the variation of resistance with temperature. In this case the solution of the equation reduces to the form—

$$\theta = x(l-x)C^2R_o/2lqk. \quad (9)$$

By a property of the parabola, the mean temperature is 2/3rds of the maximum temperature, we have therefore—

$$(R-R_o)/aR_o = lC^2R_o/12qk; \quad (10)$$

which gives the conductivity directly in terms of the quantities actually observed. If the dimensions of the bar are suitably chosen, the distribution of temperature is always very nearly parabolic, so that it is not necessary to determine the value of the critical current $C^2=hpl/aR_o$ very accurately, as the correction for external loss is a small percentage in any case. The chief difficulty is that of measuring the small change of resistance accurately, and of avoiding errors from accidental thermo-electric effects. In addition to the simple measurements of the conductivity (M'Gill College, 1895–96), some very elaborate experiments were made by King (*Proc. Amer. Acad.*, June 1898) on the temperature distribution in the case of long bars with a view to measuring the Thomson effect. Duncan (*M'Gill College Reports*, 1899), using the simple method under King's supervision, found the conductivity of very pure copper to be 1·007 for a temperature of 33° C.

(b) The method of Kohlrausch, as carried out by Jæger and Diesselhorst (*Berlin Acad.*, July 1899), consists in observing the difference of temperature between the centre and the ends of the bar by means of insulated thermo-couples. Neglecting the external heat-loss, and the variation of the thermal and electric conductivities $k$ and $k'$, we obtain, as before, for the difference of temperature between the centre and ends, the equation—

$$\theta_{max} - \theta_o = C^2Rl/8qk = ECl/8q = E^2k'/8k, \quad (11)$$

where $E$ is the difference of electric potential between the ends. Lorentz, assuming that the ratio $k/k'=a\theta$, had previously given—

$$\theta^2_{max} - \theta_o^2 = E^2/4a, \quad (12)$$

which is practically identical with the preceding for small differences of temperature. The last expression in terms of $k/k'$ is very simple, but the first is more useful in practice, as the quantities actually measured are $E$, $C$, $l$, $q$, and the difference of temperature. The current $C$ was measured in the usual way by the difference of potential on a standard resistance. The external heat-loss was estimated by varying the temperature of the jacket surrounding the bar, and applying a suitable correction to the observed difference of temperature. But the method (a) previously described appears to be preferable in this respect, since it is better to keep the jacket at the same temperature as the end-blocks. Moreover, the variation of thermal conductivity with temperature is small and uncertain, whereas the variation of electrical conductivity is large and can be accurately determined, and may therefore be legitimately utilized for eliminating the external heat-loss.

From a comparison of this work with that of Lorentz, it is evident that the values of the conductivity vary widely with the purity of the material, and cannot be safely applied to other specimens than those for which they were found.

19. *Conduction in Gases and Liquids.*—The theory of conduction of heat by diffusion in gases has a particular interest, since it is possible to predict the value on certain assumptions, if the viscosity is known. Some account of this will be found in the article on DIFFUSION OF GASES, or in Meyer's *Theory of Gases.* The experimental investigation presents difficulties on account of the necessity of eliminating the effects of radiation and convection, and the results of different observers often differ considerably from theory and from each other. The values found for the conductivity of air at 0° C. range from ·000048 to ·000057, and the temperature-coefficient from ·0015 to ·0028. The result should be independent of the pressure within wide limits if molar convection is eliminated, and should be proportional to the product of the viscosity and the specific heat at constant volume; but the numerical factor is probably different for different gases according to the complexity of the molecule.

The conductivity of liquids has been investigated by similar methods, generally variations of the thin plate or Guard-Ring method. A critical account of the subject is contained in a paper by Chree (*Phil. Mag.*, July 1887). Many of the experiments were made by comparative methods, taking a standard liquid such as water for reference. A recent determination of the conductivity of water by Milner and Chattock, employing an electrical method, deserves mention on account of the careful elimination of various errors (*Phil. Mag.*, July 1899). Their final result was $k=$ ·001433 at 20° C., which may be compared with the results of other observers, Lundquist (1869), ·00155 at 40° C.; Winkelmann (1874), ·00104 at 15° C.; Weber (corrected by Lorberg), ·00138 at 4° C., and ·00152 at 23·6° C.; Lees (*Phil. Trans.*, 1898), ·00136 at 25° C., and ·00120 at 47° C.; Chree, ·00124 at 18° C., and ·00136 at 19·5° C. The variations of these results illustrate the experimental difficulties. It appears probable that the conductivity of a liquid increases considerably with rise of temperature, although the contrary would appear from the work of Lees. A large mass of material has been collected, but the relations are obscured by experimental errors. (H. L. C.)

**Coney Island,** a sand bar at the west end of the south shore of Long Island, New York, U.S.A., within the corporate limits of Greater New York City. It is five miles long east and west, and about a mile in average breadth, and is separated from the mainland by a narrow creek and a stretch of marsh. It is about ten miles distant from the centre of Brooklyn, with which it is connected by several lines of railway, while with New York in summer it is connected by several lines of steamboats. It is a popular resort for the metropolis. On a fine sandy beach five miles in length, which gently shelves to the Atlantic and has little undertow, several seaside places—Manhattan Beach, Brighton Beach, West Brighton, and West End—face the sea. The first two have immense hotels, with ample pleasure-grounds and bath-houses. West Brighton is, in the season, the most crowded and most popular. All the

fun of the fair is to be found there, and the scene on a fine Sunday in summer beggars description.

**Confession.**—The confession of sins is commanded in the New Testament (James v. 16; 1 John i. 9); and it has always formed part of Christian worship. But further questions arise. To whom is the confession to be made? To the Church, or to a priest, or to one's neighbour: or is it due to God alone? Must all sins be confessed, or only the most heinous? Must they be counted up, and specified in detail? Again, all Christians agree that God forgives the sins of the penitent, and baptism is generally regarded as the sacrament of forgiveness; but is there further provision for sins committed by baptized Christians, who (it is agreed) cannot be baptized again? Has any authority to convey and apply God's pardon been given to man beyond the command to baptize?

Once more, it is generally agreed that to the Church or her ministers belong the right and the duty of excommunicating notorious sinners; and therefore (as most have thought) of readmitting them to communion, when satisfied of the genuineness of their repentance. But disputes on this subject gave rise to bitter struggles in early days (see *Ency. Brit.*, 9th ed., arts. MONTANISM, NOVATIAN, DONATISTS), and the modes of exercising discipline and ascertaining penitence have varied widely in the Church. Moreover, the most deadly sins are by no means always notorious, and the publication of some offences would only produce further scandal and mischief; and so there grew up a sort of compromise between public discipline and private confession to God alone; and the existing penitential systems of the Roman and Greek Churches have their roots rather in Church discipline and questions of admission to, and refusal of, communion than in the need the pious sinner feels of being personally reconciled to God. In the Middle Ages a theory that each sin, even though the sinner be forgiven by God, entails a definite quantity of purgative punishment, and so constitutes a debt to be discharged either in this world or the next, caused the idea of the reconciliation of the penitent to be further obscured by that of assessing his penalty; and in consequence it was necessary that he should in his confession enumerate all his "mortal" sins, reckoning up as precisely as possible the exact number of times he had been guilty of each. And it was even held that provided the sinner thus submitted to the tribunal of penance, it did not matter whether he was really contrite or not. But the intricate subject of mediæval teaching on "satisfaction" and on the sacramental character of penance fall beyond the scope of this article.

*Teaching of the Book of Common Prayer.*—The Church of England holds since the Reformation a central position in this as in many other matters; and to draw out her teaching will sufficiently illustrate the different views that are held. The Prayer-Book does not appoint that any public confession of sins shall be made by the adult candidate for baptism, and all it says on the subject is concerned with post-baptismal sin, which (it is implied) can be forgiven, however heinous. Confession of some sort is clearly regarded as a necessary element in the life of every Christian, for (since 1552) it forms part of each of the regular public services of the Church, and this acknowledgment of sin is to be made not merely in private to God, but twice daily (at least by the clergy) in the presence of the congregation. Though these confessions are naturally expressed in general terms, the rubric in the Forms of Prayer to be used at Sea (a service added in 1661) indicates that each person is intended to apply the words to his own case—"in which (humble confession) everyone ought seriously to reflect upon those particular sins of which his conscience shall accuse him." Moreover, at the beginning of the Communion service the Ten Commandments are recited one by one, and each is followed by a petition for pardon, in such a way as plainly to imply that each person is secretly to remember and confess his own breaches of each Commandment in turn. Thus the method of confession adopted in the public services of the Church of England, with which the Book of Common Prayer is primarily concerned, may be described as one of general confession to God in the face of the Church, to be in secret used by each member of the congregation for the confession of his own particular sins, and to be followed by public absolution. But three other methods of confession for private use are mentioned in the exhortations in the Communion service, which constitute the principal directory for private devotions among the authoritative documents of the English Church. First, all men are urged to practise secret confession to God alone. Ye are "to examine your lives and conversations by the rule of God's commandments; and whereinsoever ye shall perceive yourselves to have offended, either by will, word, or deed, there to bewail your own sinfulness, and to confess yourselves to Almighty God, with full purpose of amendment of life." Here clearly the sins are to be acknowledged in detail. Secondly, where the nature of the offence admits of it, the sinner is to acknowledge his wrong-doing to the neighbour he has aggrieved, and so far as he can to make restitution. And thirdly, and here we reach the chief point of controversy, the sinner who cannot satisfy his conscience by these other methods, is invited to open his grief to a minister of God's Word. Similarly, the sick man is to be *moved* (this word was inserted in 1661) to make a special confession of his sins if he feel his conscience troubled with any weighty matter. The Prayer-Book does not absolutely require that in this case the penitent should enumerate every sin he has committed; but evidently he is to unfold the whole of that which burdens his conscience. The priest is bound under the most stringent penalties never to divulge what he has thus learnt. See the 113th Canon of 1604, which, however, excepts crimes "such as by the laws of this realm the priest's own life may be called into question for concealing the same."

The history of the passages in the Exhortations about private confession is interesting. The first Prayer-Book of Edward VI. (1549) gives direction as follows:—"And if there be any of you whose conscience is troubled and grieved in anything, lacking comfort or counsel, let him come to me, or to some other discreet and learned priest, taught in the law of God, and confess, and open his sin and grief secretly, that he may receive such ghostly counsel, advice, and comfort that his conscience may be relieved, and that of us (as of the ministers of God and of the Church) he may receive comfort and absolution, to the satisfaction of his mind, and avoiding of all scruple and doubtfulness; requiring such as shall be satisfied with a general confession not to be offended with them that do use, to their further satisfying, the auricular and secret confession to the priest; nor those also which think needful or convenient, for the quietness of their own consciences, particularly to open their sins to the priest, to be offended with them that are satisfied with their humble confession to God, and the general confession to the Church." This was considerably shortened in the second Prayer-Book (1552). The word minister was substituted for priest. The objects of the private ministration are thus described: "that he may receive such ghostly counsel, advice, and comfort as his conscience may be relieved; and that by the ministry of God's Word he may receive comfort and the benefit of absolution, to the quieting of his conscience and avoiding of all scruple and doubtfulness." And the words about mutual toleration were unfortunately cut out. Further changes were made in 1661, when the passage was brought into its present shape.

As regards discipline, the rubrics upon the Communion service provide for the exclusion of notorious sinners, and the Commination service regrets the disuse of the public

discipline by which such were punished. The 33rd of the 39 Articles and certain Canons assume the existence of ecclesiastical courts for the excommunication and restoration of such persons; but it is long since such courts were put in motion, and for the most part notorious sinners excommunicate themselves.

The Prayer-Book uses very strong language on ministerial absolution. Power and commandment have been given to ministers to declare and pronounce the remission of sins (Mattins), and Christ's authority, which was primarily left to the Church, has been committed to the priest for this purpose (Visitation of the Sick; see also Ordering of Priests). This absolving power is exercised both in the public services of the Church and in private ministrations.

Thus Bishop Latimer in his 6th Sermon on the Lord's Prayer (1552) wrote: "The priest or minister, call him what you will, he hath power given unto him from our Saviour to absolve in such wise as he is commanded by Him . . . I would have them that are grieved in conscience to go to some godly man, which is able to minister God's Word, and there to fetch his absolution, if he cannot be satisfied in the public sermon; it were truly a thing which would do him much good . . . I may absolve you, as an officer of Christ, in the open pulpit in this wise, 'As many as confess their sins unto God . . . and believe . . . *Ego absolvo vos*; I as an officer of Christ, as His treasurer, absolve you in His Name.' This is the absolution that I can make by God's Word."

The Prayer-Book of 1549 pointed out that the benefit is conditional on the sincerity of the repentance. "For neither the absolution of the priest can anything avail (the impenitent), nor the receiving of this Holy Sacrament doth anything but increase their damnation." These words referred primarily, but not exclusively, to the public absolution in the Communion service. It is maintained by some that, except in the case of the sick, the only legitimate method of receiving absolution in the Church of England is in the public services of the congregation; and the Church of Ireland has recently made important alterations even in the passages that concern the sick, while the Protestant Episcopal Church of the United States has omitted that part of the Visitation Service altogether.

The main point of recent controversy in the Church of England has been the question of auricular confession, *i.e.*, confession made into the ear of the priest. Its essential features are that a priest hears the penitent "open his grief" in secret, and if he is satisfied of the sincerity of the repentance, he pronounces a special authoritative absolution. It is common also for him to give "ghostly counsel and advice," technically called "direction." And he may further impose certain conditions, such as the restitution of stolen property, and defer the absolution until these have been fulfilled. The priest thus hears secrets, has to form a judgment on the penitent's sincerity, and may lay definite commands upon the man or woman who has come to consult him. The early history of this practice has been sketched in the article CONFESSION in the 9th edition of this Encyclopædia, and it is there stated that it was not the Reformers' intention to abolish it, but that it was still common even at the end of the 17th century for priests to hear confessions. It is probably not too much to say that auricular confession has never altogether died out in the Church of England, but it is obvious that evidence on the subject must always be hard to find. Recently there has been a great increase and development of the practice, dating from the Oxford Movement in the early part of the 19th century. Two chief difficulties have attended this revival. In the first place, owing to the general disuse of such ministrations, there were very few English clergy who had experience in delicate questions of conscience; and there had been no treatment of casuistry since Sanderson and Jeremy Taylor (see *Ency. Brit.*, 9th ed., CASUISTRY). Those, then, who had to hear penitents unburden their souls were driven to the use of Roman writers on the subject. A book called *The Priest in Absolution* was compiled, and at first privately circulated among the clergy; but in 1877 a copy was produced in Parliament, and gave rise to much scandal and heated debate, especially in the House of Lords and in the newspapers. In the following year Dr Pusey published a translation of the Abbé Gaume's *Manual for Confessors*, abridged and "adapted to the use of the English Church." The other chief difficulty arose from the absence of any authoritative restraint on the hearing of confessions by young and unqualified priests. With characteristic love of liberty, the Church of England allows the penitent who wishes for special help to resort to any "discreet and learned minister," instead of sending him to his parish priest, as is the Roman rule (though in practice there are large exceptions). In 1873 a petition signed by 483 clergy was presented to Convocation asking for the "education, selection, and licensing of duly qualified confessors." The bishops declined so to act, but drew up a report on the subject of confession. The question excites the keenest feeling, and extreme views are held on either side. On the one hand, it is suggested that indecent questions might be asked of the young and innocent; and that frequent secret interviews give rise to scandal if not to sin. None will deny the reality of this last risk, but it may be doubted whether any other method of individual dealing with souls does not lead to the same dangers; and the greater formality of confession, especially if it takes place in church, may even afford something of protection to both sides. In consequence of recent outcry, inquiry was made in 1900 by the bishops, at the request of the House of Lords, into the number of confessional-boxes erected in parish churches within their dioceses. On investigation, the number of alleged cases dwindled into a mere handful. In 1898 the Bishop of Salisbury advised "the minister to sit within the altar rails . . . and to let the penitent kneel outside it" (*Considerations on Public Worship and on the Ministry of Penitence*). On the other hand, there are those who speak as if auricular confession were a necessary element in every Christian life (it is obligatory in the Roman Church at least once a year), and hold that post-baptismal sin of a grave sort can receive forgiveness in no other way. Such a view cannot be found within the covers of the English Prayer-Book.

**Confirmation.**—Confirmation, in the religious sense, is the initiatory rite supplementary to and completing baptism, which is especially connected with the gift of the Holy Ghost to the candidate. The word "confirmation" has only been used in this technical sense since the 5th century, and only in the Western Churches of Christendom and in their offshoots; but the rite itself has been practised in the Church from the beginning. The history of confirmation has passed through three stages. In the first ages of the Church, when it was recruited chiefly by converts who were admitted in full age, con-

firmation, or the laying-on of hands (Heb. vi. 2), followed close upon baptism, and in the majority of cases the two were combined in a single service. But only the highest order of ministers could confirm (see Acts viii. 14–17); whereas priests and deacons, and in an emergency lay men and even women, could baptize. There was therefore no absolute certainty that a believer who had been baptized had also received confirmation (Acts xix. 2). But two circumstances tended to prevent the occurrence of such irregularities. In the first place, there were in early days far more bishops in proportion to the number of believers than is the custom now; and secondly, it was the rule (except in cases of emergency) to baptize only in the season from Easter to Pentecost, and the bishop was always present and laid his hands on the newly baptized. Moreover, in the third and fourth centuries the infants of Christian parents were frequently left unbaptized for years, *e.g.*, Augustine of Hippo. Later, when the Church had come to be tolerated and patronized by the State, her numbers increased, the rule that fixed certain days for baptism broke down, and it was impossible for bishops to attend every baptismal service. Thereupon East and West adopted different methods of meeting the difficulty. In the East greater emphasis was laid on the anointing with oil, which had long been an adjunct of the laying-on of hands: the oil was consecrated by the bishop, and the child anointed or "sealed" with it by the parish priest, and this was reckoned as its confirmation. With its baptism thus completed, the infant was held to be capable of receiving Holy Communion. And to this day in the Eastern Church the infant is baptized, anointed, and communicated by the parish priest in the course of a single service; and thus the bishop and the laying-on of hands have disappeared from the ordinary service of confirmation. The West, on the other hand, deferred confirmation, not at first till the child had reached years of discretion, though that afterwards became the theory, but from the necessities of the case. The child was baptized at once, that it might be admitted to the Church, while the completion of its baptism was put off till it could be brought to a bishop. Western Canons insist on both points at once; baptism is not to be deferred beyond a week, nor confirmation beyond seven years. And to give an historical example, Henry VIII. had his daughter, afterwards Queen Elizabeth, both baptized and confirmed when she was only a few days old. And still the rubrics of the English Prayer-Book direct that the person who is baptized as an adult is to "be confirmed by the bishop so soon after his baptism as conveniently may be."

But theologians in the West had elaborated a theory of the grace of confirmation, which made its severance from baptism seem natural; and at the time of the Reformation, while neither side favoured the Eastern practice, the Reformers, with their strong sense of the crucial importance of faith, emphasized the action of the individual in the service, and therefore laid it down as a rule that confirmation should be deferred till the child could learn a catechism on the fundamentals of the Christian faith, which Calvin thought he might do by the time he was ten. Many of the Protestant bodies have abandoned the rite, but it remains among the Lutherans (whether Episcopal or not), and in the group of churches in communion with the Church of England.

At the last revision of the Book of Common Prayer an addition was made to the service by prefixing to it a solemn renewal of their baptismal vows by the candidates in their own persons; and in the teeth of history and of the wording of the service, this has often been taken to be the essential feature of confirmation. Practically, the preparation of candidates for confirmation is the most important and exacting duty of the parish priest, as the administration of the rite is the most arduous of a bishop's tasks; and after a long period of slovenly neglect, these duties are now generally discharged with great care: classes are formed and instruction is given for several weeks before the coming of the bishop to lay on hands "after the example of the Holy Apostles" (prayer in the Confirmation Service). Of late years there has been a controversy among Anglican theologians as to the exact nature of the gift conveyed through confirmation, or in other words whether the Holy Spirit can be said to have come to dwell in those who have been baptized but not confirmed. The view that identifies confirmation rather than baptism with the Pentecostal outpouring of the Spirit on the Church has had to contend against a long-established tradition, but appeals to Scripture (Acts viii. 16) and to Patristic teaching.

(W. O. B.)

**Confirmation of Bishops.**—In canon law, confirmation is the process by which the election of a new bishop receives the assent of the episcopate. This can be traced back to the 3rd century, and indeed may be said to be involved, in principle, in the fact of consecration. From the 4th century it has been regarded as the definite ratification of the election by the bishops of the province (*Conc. Nic.* can. iv.); and by degrees it has come to be made, as a rule, through the metropolitan, and very often at the will of the civil power. In the East it has to a large extent thrown the actual election into the shade. In the churches of the Roman communion the right of confirmation, like many other episcopal rights, has gradually been appropriated by the papacy. For a time indeed, from the 14th century onwards, the popes reserved to themselves the whole appointment of bishops. This is no longer the case, but the confirmation of bishops is still in their hands, however they may have been chosen. In England various attempts were made before the Reformation to resist this tendency. One of the demands of the English Embassy sent to Bruges in 1373 was that confirmation should remain in the hands of the metropolitan; and in 1415 an ordinance was passed, having the force of law, directing that during the voidance of the papal see bishops-elect should be confirmed by their metropolitan, according to ancient custom and the practice of foreign churches. In accordance with this, Chichele confirmed John Wakering, elect of Norwich, in 1416. At the Reformation the share of the papacy in appointing bishops was abolished, but the confirmation became almost formal in character. By 25 Hen. VIII. c. 20, s. 4, it is provided that after an episcopal election a royal mandate shall issue to the archbishop of the province "requiring him to confirm the said election," or, in case of an archbishop-elect, to one archbishop and two bishops, or to four bishops, "requiring and commanding" them "with all speed and celerity to confirm" it. This practice still prevails, in the case of dioceses which have chapters to elect. The confirmation has usually been performed by the archbishop's vicar-general, and, in the southern province, at the church of St Mary-le-Bow, London; but since 1901 it has been performed, in part, at the Church House, Westminster, in consequence of the disorder in the proceedings at Bow Church on the confirmation there of Dr Winnington Ingram as Bishop of London. All objectors are cited to appear on pain of contumacy after the old form; but although the knowledge that opposition might be offered

has been a safeguard against improper nominations, *e.g.*, in the case of Dr Clarke the Arian, confirmation has never been refused since the Reformation. In 1628 Dr Rives, acting for the vicar-general, declined to receive objections made to Richard Montague's election to the see of Chichester on the ground that they were not made in legal form. An informal protest against the confirmation of Dr Prince Lee of Manchester in 1848 was almost immediately followed by another in due form against that of Dr Hampden, elect of Hereford. The vicar-general refused to receive the objections, and an application to the Queen's Bench for a *mandamus* was unsuccessful, the judges being divided, two against two. In 1869, at the confirmation of Dr Temple's election as Bishop of Exeter, the vicar-general heard counsel on the question whether he could receive objections, and decided that he could not. When the same prelate was elected to Canterbury, the course here laid down was followed, as also at the confirmation of Dr Creighton's election to the see of London. Objections were again raised, in 1902, against Dr Gore, elect of Worcester; and an application was made to the King's Bench for a *mandamus* against the archbishop and his vicar-general when the latter declined to entertain them. By a unanimous judgment (10th February) the Court, consisting of the L. C. J. (Lord Alverstone) and Justices Wright and Ridley, refused the *mandamus*. Without deciding that objections (*e.g.*, to the identity of the elect, or the genuineness of documents) could never be investigated by the vicar-general or the archbishop, it held that they could not even entertain objections of the kind alleged. Formerly the archbishop had the right of *option*, *i.e.*, of choosing any one piece of preferment in the gift of a bishop confirmed by him, and bestowing it upon whom he would; but this has been held to be abolished by a clause in the Cathedral Act (3 & 4 Vict. c. 113, s. 42). And the election of a dean by a cathedral chapter used to receive the bishop's confirmation (Oughton, *Ordo Judiciorum*, No. cxxvii.).

(W. E. CO)

**Congleton,** a municipal borough and market-town of England, on the Dane, 8 miles south-south-west of Macclesfield, in the Macclesfield parliamentary division of the county of Chester. Station on the North Staffordshire Railway, and situated on the Macclesfield Canal. The town is divided into three wards, under 6 aldermen and 18 councillors. There are four Ecclesiastical parish churches and a Roman Catholic church. A Congregational chapel was erected in 1877, and a Unitarian chapel in 1883. A Primitive Methodist chapel was rebuilt in 1890. There are Church of England, a Roman Catholic, and Wesleyan schools. The industries include fustian, towel, couch, chair, and nail factories, iron and brass foundries, stone quarries, and corn mills. Area of municipal borough, 2572 acres. Population (1881), 11,116; (1891), 10,744; (1901), 10,706.

**Congo,** formerly known also as ZAIRE, the largest and second in length of the rivers of Africa, and second in size of all the rivers of the world, with a length of probably at least 3000 miles, and a drainage area, according to the calculation of Dr Bludau, of 1,425,000 square miles. This vast area, measuring some 1400 miles in either diameter, falls from all sides to the Equatorial basin by which the interior plateaux of Africa are broken in the west, and which seems once to have been occupied by an inland sea, having its deepest part somewhat south of the Equator, and in about 17°–18° E. To the west and north this basin is bounded by comparatively narrow bands of higher ground, while to the east and south the drainage area of the river includes considerable portions of the high plateau lands of East and South Africa. The main drainage of the Congo system is thus to the north and west, and these two directions dominate the great sweep of the main stream before it is deflected south on approaching the western highlands, through which it finally forces a way to the Atlantic Ocean. From the high lands of the south and east the land falls in a succession of steps, generally marked by gorges or rapids in the course of the streams. Many of these occur along a line of broken country, sometimes known as the Mitumba Mountains, which previous to the cutting of the gorges may have held back a series of extensive lakes, now in great part drained, in the upper valleys of the separate streams.

*Head-Streams.*—The most remote of these, the Chambezi, rises, with the Chozi and other feeders, on the southern versant of the high plateau between Lakes Nyasa and Tanganyika, at an elevation of about 5000 feet above the sea. Its source is placed by Mr L. A. Wallace in about 9° 6′ S., 31° 20′ E., while the Chozi rises in the same latitude about half a degree to the east. After the junction of the two streams, the Chambezi skirts the southern borders of the Awemba country, receiving many tributaries, and soon becoming a wide river with steep wooded banks and many islands. The river enters Lake Bangweulu at its south-east corner, the actual mouth being apparently choked with aquatic vegetation, through which narrow channels admit the passage of canoes. When seen in 1899 by Codrington, about 15 miles from the lake, it had a width of 2 miles and a depth of 19 feet, the altitude being here 3800 feet. Near the south point of Bangweulu, in 11° 31′ S., the Luapula makes its exit through a vast marsh, with isolated lakelets, the whole of which was surveyed by Weatherley in 1896–99. In about $12\frac{1}{2}$° S. the Luapula, after receiving the Luombwa and Moengashe from the south, turns north and precipitates itself down the Mumbotuta Falls, the thunder of which can be heard on a still night 8 or 9 miles. The river, the width of which varies from 250 to 1200 yards, is almost unnavigable until below the Johnston Falls (Mambilima of the natives), a series of rapids extending from 10° 46′ to 10° 33′ S. Before entering Lake Mweru the Luapula again passes through a swampy region of deltaic character, the water escaping eastwards by various channels, and after spreading over a wide area, finally passing into Mweru by lagoon-like channels east of the main Luapula mouth. The most southerly portion of the lake, a shallow bay extending to south., lies west of the Luapula, from which it is separated by a tongue of land. Although generally deeper than Bangweulu, Mweru (2800 feet) seems to have decreased in extent, the cliffs to the west being bordered by a strip of low ground once covered with water. The Luapula (known also as the Lufira) makes its exit at the north-west corner of the lake, and bending westwards in a winding course, passes, with many rapids, across the zone of the Mitumba Mountains, falling during this interval nearly 1000 feet. Practically the whole course of the river has been explored by Captain Hinde, Lieutenant Brasseur, and others, with the result that the lake formerly marked on the maps as Lange or Ulenge is proved to be non-existent. In about 6° 40′ S. the Luapula joins the Kamolondo, the western main branch of the Upper Congo, which, as it flows in a broad level valley at a lower level than the eastern branch, is held by some to be the true head-stream. Four principal streams—the Kuleshe, Lubudi, Nzilo or Lualaba, and Lufira, all

rising on the southern limits of the Congo basin, between 11° and 12° S.—combine to form the Kamolondo, the valley of which contains many small lakes and backwaters. The Nzilo and Lufira pass through the Mitumba Mountains in deep gorges, their courses being broken by rapids for distances of 40 to 50 miles.

*The Upper Congo or Lualaba.*—During its northerly course to the Equator, the united stream of the Congo—after breaking through the ridge of the Bambara Hills in another series of rapids in 4½°–3½° S.—becomes a majestic river, often over a mile wide, with flat wooded banks, the only real impediment to navigation between 4½° and the Stanley Falls being the rapids near Nyangwe in 3° 55′, and at Ukassa in 3° 15′. Between the junction of the two main upper branches (about 1700 feet above the sea) and the first of the Stanley Falls (1520 feet) the fall of the river is less than 200 feet, in a distance of 500 miles. During the whole of this section the Lualaba receives most of its tributaries from the east. Of these, the Lukuga, the outflow from Lake Tanganyika, has been followed throughout its whole length, and has been found to be broken by rapids, falling 1000 feet during its course of some 300 miles. Farther north the streams which drain the forest region between 4° S. and the Equator have been only partially explored, the Elila or Lira, the Urindi, and the Lowa being the most important. Their sources lie on an upland region west of the Central African rift valley. The Urindi in its middle course has a general width of 60 to 100 yards, but the Lowa is larger, receiving two important affluents, the Ozo and Luvuto, both from the north. Its lower course is very tortuous.

*The Middle Congo.*—After passing the Stanley Falls,—7 in number besides minor rapids, with a total fall of some 200 feet,—the Congo enters, at an altitude of some 1320 feet, the great alluvial plain of West Equatorial Africa, assuming a westerly direction, and also changing its character. This section of the river, navigable for a distance of at least 1000 miles, may be designated the Middle Congo. Gradually widening out and becoming strewn with low alluvial islands, it forms great lacustrine expansions, sometimes (as, *e.g.*, in 21° and 22° 30′ E.) 16–20 miles wide, but is from time to time contracted by the approach of high ground on either side. The islands, like the banks, which appear to be often raised above the level of the surrounding country, are forest-clad, but are inundated at high water. In 22½° E. the river reaches its most northern point (about 2° 12′ N. on the north bank), beyond which its course gradually bends south, and in 2° 45′ S., on approaching the western continental highlands, it again contracts to a width of a mile and under, remaining, however, unbroken by rapids until after passing the lake-like expansion of Stanley Pool. Here its elevation above the sea is just over 1000 feet.

*Northern Tributaries.*—Of the right bank tributaries of the Middle Congo, the Chopo and Lindi, which enter by one mouth in about 25° 4′ E., are little known. Their basins do not extend to the Outer Congo watershed, but the next feeder, the great Aruwimi, was found by Stanley to rise, as the Ituri, in close proximity to Albert Nyanza, flowing generally from east to west. It is formed of many branches, including the Nepoko from the north, and its upper basin extends over 2½° of latitude. The upper river, to about 27° E., is much broken by rapids, but apart from those of Yambuya in 25°, which form the limit of navigation from the mouth, the lower section is generally navigable. The Aruwimi flows almost entirely through the great equatorial forest, which here seems to reach its maximum density. The next tributary, the Rubi, rises in about 26° E., and flowing generally west, joins the Congo by two mouths, 22° 40′–50′. Within the bend of the Ubangi, the greatest northern tributary, the Mongalla or Dua flows in a somewhat similar curve (on a smaller scale) from beyond 23° E. The identity of the Ubangi with the Welle of Schweinfurth was finally proved by Vangele in 1888, and its upper basin has since been explored by French and Belgian officers. Next to the Welle (principal tributary Bomokandi, from the south), its largest upper branch is the Mbomu, which, rising in 27° 12′ E., 4° 50′ S., on the confines of the Bahr-el-Ghazal region, itself receives two large streams, the Shinko and Bali, from the north. The junction of the Welle and Mbomu is in 22° 37′ E., and a short distance farther west the Kotto, coming from beyond 8° N., on the borders of Darfur, and forming the most northerly extension of the Congo basin, enters the united stream on the right bank. The remaining tributaries (still mostly coming in on the right bank) are smaller, but the Kemo, which joins the Ubangi near its most northern point (5° 8′ N.), is of some importance as offering water-communication within a short distance of the Shari basin. The Upper Ubangi is broken in many places by rapids, between which are navigable stretches in which the river is often (especially west of 25°) wide and strewn with islands. The Zongo series of rapids near the great bend of the Ubangi, do not form an insuperable obstruction at all states of the river, but navigation is quite blocked by the Mokwangu Falls in 23° 5′ E. (10 feet), by the rapids of Goie (the worst on the upper river) in 25°, and by those of Panga in 26° 40′. A little below the mouth of the Ubangi, the Sanga, a large stream flowing from north to south, enters the Congo. Its lower course is tortuous, as it flows across level, often swampy, plains; but though comparatively narrow, it is navigable for a long distance. The main northern branch rises in southern Adamawa in about 7° N., while an almost equally large western branch, the Ngoko, rises in the German territory of Cameroon (probably in about 12° 10′ E.), traversing a vast tract of uninhabited forest. It is navigable to about 13° 40′ E. The Likuala, Licona, and Alima, which all join the Congo within 30 miles of the mouth of the Sanga, are much smaller streams. The Licona is still almost unexplored.

*Southern Tributaries.*—The first of the southern tributaries of the Middle Congo, the Boloko or Lubilash of Grenfell, which enters in 24° 17′ E., has been proved to be identical with the Lomami of Cameron, rising in nearly 9° S., and thus flowing through more than nine degrees of latitude. Its course is generally parallel to the Upper Congo, which it approaches within 40 miles between 2° and 3° S. It is comparatively narrow and tortuous, but deep, with a strong current, and is hardly broken by rapids north of 4½° S. About 3° S. it traverses a region of swamps, which may have given rise to reports of a great lake in this locality. Below the mouth of the Lomami there is a long stretch with no southern tributary, as the great plain within the Congo bend is drained by streams flowing from east to west parallel to the main river. The northern branch of the Lulonga, which enters in 0° 40′ N., approaches the latter within 20 miles in its upper course. The main branch of the Ruki, which enters just north of the Equator, and the Lukenye or Lukeni, the northern unit of the great Kasai system, have their sources between 24° and 25° E. in the vicinity of the Lomami swamp above alluded to. These streams have tortuous courses, for the most part not broken by rapids, flowing across a level country once occupied by a lake, of which the present Lake Leopold II., connected with the lower course of the Lukenye, is the scanty remnant. Its shores are low and inundated in the rains, so that its outline is very ill-defined. Besides the Lukenye, the chief units of the Kasai system all flow north in parallel courses before acquiring the east to west

direction of the Lower Kasai on reaching the latitude of 3°–4° S. The most important in order from east to west are the Lubefu, Lubilash or Sankuru, Lulua; Upper Kasai, with its tributaries Luembo, Chihumbo, Luajimo, Chikapa, and Lowo; Loange, Juma or Kwilu, Wamba, and Kwango, the last three uniting before joining the Kasai. Most of these are broken by rapids along a line running from north-east to south-west between 5° and 8° S., which marks the descent from the higher to the lower plateau; but their lower courses are navigable. The Lulua, Kasai, Chihumbo, and Kwango all spring from the southern Congo water-shed, traced in 1899–1900 by the Belgian expedition under Lemaire, who showed the incorrectness of the old idea that the basins of the Congo and Zambezi are connected through Lake Dilolo. This small lake, though situated on the water-parting, was found to have normally no connexion with either system, though apparently sending water to the Zambezi after heavy rains. Near its mouth the Kasai, which in its lower course is generally a broad stream strewn with islands, is narrowed to about half a mile on passing through a gap in the first line of the West African highlands, by the cutting of which the old lake of the Kasai basin must have been drained.

*The Lower Congo.*—As already stated, the Congo is greatly narrowed on first reaching the more elevated ground in 2° 45′ S.; the actual rapids, however, begin only immediately below Stanley Pool. The whole system of highlands (sometimes known generally as the Serra do Crystal) seems to consist of two principal mountain zones with an intermediate zone of lower elevation. The passage of this last is marked by a more navigable stretch on the Lower Congo, extending from Manyanga to Isangila—a distance of 70 miles, during which the only serious rapids are those of Chumbo and Itunzima, the latter in 13° 54′ E.; while above and below, rapids succeed each other at short intervals. Some eighteen main rapids or falls occur during the upper section (87 miles), in the course of which the level drops about 500 feet; and about ten in the lower section (56 miles), during which the fall is about 300. The last rapid occurs a little above Matadi, beyond which the river is navigable for large vessels to the sea, a distance of about 85 miles. It gradually widens out into an estuary, bordered by creeks and islands of a deltaic character and traversed by a deep cañon, in which soundings of 900 feet have been obtained. This cañon or gully is continued into the open sea for over 100 miles, with depths as much as 4000 feet below the general level of the sea floor. Just below Matadi, where the width is about half a mile, depths of 276 and 360 feet have been found, the current here running at from 4 to 8 knots, according to the season; while the difference in level between high and low water (not in any way due to tidal action) is 20–25 feet. The tides are felt as far as Boma, but the rise is here not above 1 foot; while at the mouth of the river it is 6 feet. The investigations carried out by Commander Purey-Cust in 1899 showed that the cañon above mentioned is occupied by salt water, which is nearly motionless. Above it the fresh water runs with increasing velocity, but decreasing depth, so that just within the mouth of the river it reaches only a few feet from the surface. (E. He.)

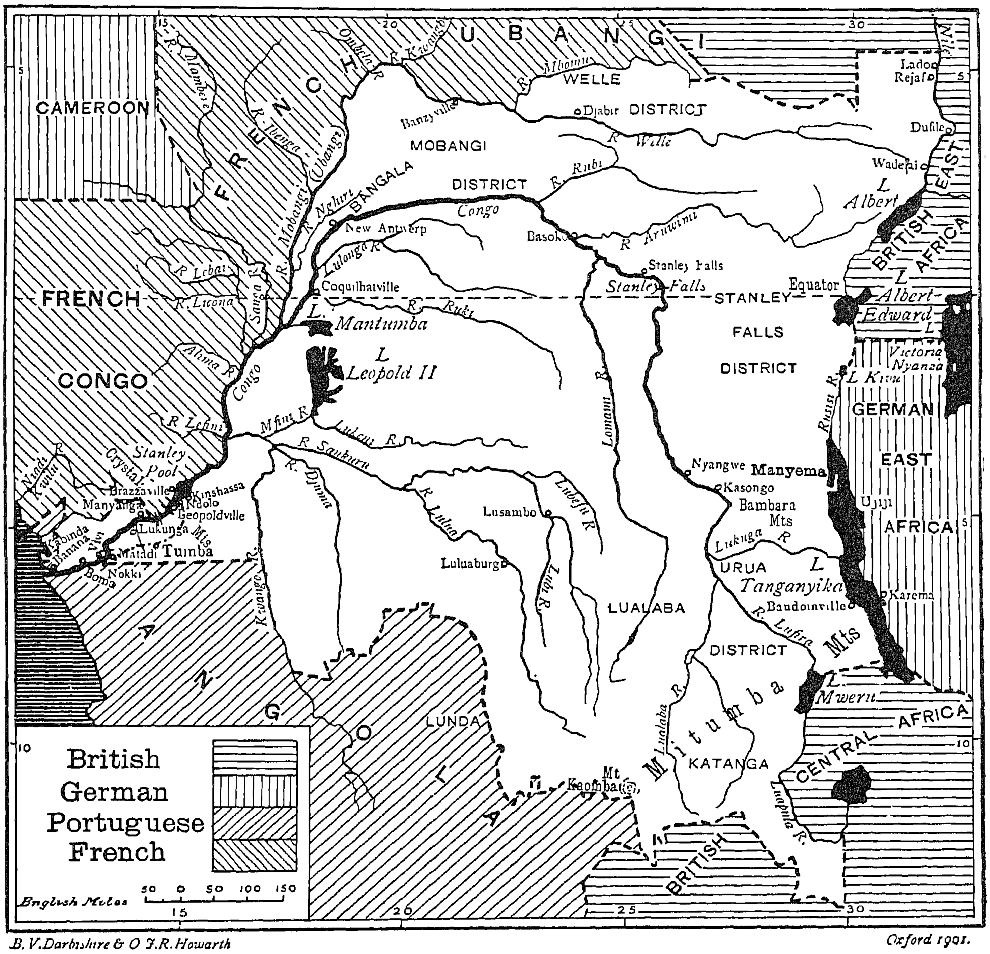
**Congo,** a Portuguese district on the west coast of Africa, comprising the territory of Kabinda on the north side of the Congo and the northern parts of the province of Angola on the south side of the river. Its exports embrace oil, india-rubber, coffee, cocoa-nuts, gums, and ivory; and the export trade increased from £149,100 in 1888 (the first full year of the Portuguese administration) to £222,000 in1896. The chief town is Kabinda, on the coast, 35 miles north of the mouth of the Congo.

**Congo Free State.**—The Congo Free State (*État Indépendant du Congo*) is one of the largest of the political divisions of Equatorial Africa. It occupies a unique position among modern states, as it may be said to owe its existence to the ambition and force of character of a single individual. It dates its formal inclusion among the independent states of the world from 1885, when its founder, Leopold II., king of the Belgians, became, its head. But to understand how it came into existence, a brief account is needed of its Sovereign's connexion with the African continent. In 1876 King Leopold summoned a conference at Brussels of the leading geographical experts in Europe, which resulted in the creation of "The International Association for the Exploration and Civilization of Africa." To carry out its objects an International Commission was founded, with Committees in the principal countries of Europe. Committees were in fact so established, but the Belgian Committee at Brussels, where also were the headquarters of the International Commission, displayed from the first greater activity than did any of the other committees. It turned its attention in the first place to East Africa, and several expeditions were sent out, which resulted in the founding of a Belgian station at Karema on Lake Tanganyika. But the return of Mr (afterwards Sir) H. M. Stanley from his great journey of exploration down the Congo, forcibly directed the attention of King Leopold to the possibilities for exploration and civilization offered by the Congo region. On the invitation of the king, Mr Stanley visited Brussels, and on November 25th 1878 a separate committee of the International Association was organized at Brussels, under the name "Comité d'Études du Haut Congo." Shortly afterwards this committee became the "International Association of the Congo," which in its turn was the forerunner of the Congo Free State. The Association was provided with a nominal capital of £40,000, but from the first its funds were largely supplemented from the private purse of King Leopold; and by a gradual process of evolution the work, which was originally, in name at least, international in character, became a purely Belgian enterprise. Mr Stanley, as agent of the Association, spent four years on the river, in exploring and concluding treaties with local chiefs. The first station was founded in February 1880 at Vivi, and before returning to Europe in August 1884 Mr Stanley had established twenty-two stations on the Congo and its tributaries. Numerous expeditions were organized by King Leopold in the Congo basin, and the activity of the International Association and its agents began seriously to engage the attention of the European Powers interested in Africa. On behalf of Portugal, claims were advanced to the Congo, based on the discovery of its mouth by Portuguese navigators centuries before. In the interests of France, M. de Brazza was actively exploring on the northern banks of the Congo, and had established various posts, including one where the important station of Brazzaville is now situated. The fact that the International Association of the Congo had no admitted status as a sovereign power rendered the tenure of its acquisition somewhat precarious, and induced King Leopold to make determined efforts to secure for his enterprise a recognized position. Early in 1884 a series of diplomatic events brought the question to a head. Lord Granville, then British Foreign Secretary, in February of that year concluded a convention with Portugal, recognizing both banks of the mouth of the Congo as Portuguese territory. This convention was never ratified, but it led directly to the summoning of the Berlin Congress of 1884–85, and to the recognition of the International Association as a sovereign state.

The United States of America was the first Great

Power, in a convention signed on the 22nd of April 1884, to recognize the Association as a properly constituted state. Simultaneously, King Leopold had been negotiating with the French Government, the Association's most serious rival, not only to obtain recognition but on various boundary questions, and on the 23rd April 1884 Colonel Strauch, the president of the Association, addressed to the French Minister for Foreign Affairs a Note in which he formally declared that the Association would not cede its possessions to any Power, "except in virtue of special conventions which may be concluded between France and the Association for fixing the limits and conditions of their respective action." The Note further declared that, as a fresh proof of its friendly feeling towards France, the Association engaged to give France the right of preference if, through unforeseen circumstances, it were compelled to sell its possessions. The right of pre-emption thus given to France was, by an exchange of Notes in April 1887, declared to be without prejudice to the right of Belgium to take over the possessions of the Congo Free State as a Belgian colony. Germany was the next Great Power to recognize the position of the Free State, on the 8th November 1884, and the same recognition was subsequently accorded by Great Britain on 16th December; Italy, 19th December; Austria-Hungary, 24th December; Holland, 27th December; Spain, 7th January, 1885; France and Russia, 5th February; Sweden and Norway, 10th February; Portugal, 14th February; and Denmark and Belgium, 23rd February. While negotiations with Germany for the recognition of

***Recognition by the Powers.***



B. V. Darbishire & O. J. R. Howarth Oxford 1901.

SKETCH MAP OF CONGO FREE STATE.

the status of the Congo Free State were in progress, Prince Bismarck issued invitations to the Powers to an International Conference at Berlin. The Conference assembled on the 15th of November 1884, and its deliberations ended on the 26th of February of the following year by the signature of a General Act, which dealt with the relations of the European Powers to other regions of Africa as well as the Congo basin. The provisions affecting the Congo may be briefly stated. A Conventional Basin of the Congo was defined, which comprised all the regions watered by the Congo and its affluents, including Lake Tanganyika, with its eastern tributaries, and in this Conventional Basin it was declared that "the trade of all nations shall enjoy complete freedom." Freedom of navigation of the Congo and all its affluents was also secured, and differential dues on vessels and merchandise were forbidden. Trade monopolies were prohibited, and provisions made for civilizing the natives, the suppression of the slave trade, and the protection of missionaries, scientists, and explorers. Provision was made for the Powers owning territory in the Conventional Basin to proclaim their neutrality. Only such taxes or duties were to be levied as had "the character of an equivalent for services rendered to navigation itself"; and it was further provided that (Article 16) "The roads, railways, or lateral canals which may be constructed with the special object of obviating the innavigability or correcting the imperfection of the river route on certain sections of the course of the Congo, its affluents, and other waterways, placed under a similar system as laid down in Article 15, shall be considered, in their quality of means of communication, as dependencies of this river and as equally open to the traffic of all nations. And as on the

river itself, so there shall be collected on these roads, railways, and canals only tolls calculated on the cost of construction, maintenance, and management, and on the profits due to the promoters"; while as regards the tariff of these tolls, strangers and natives of the respective territories were to be treated "on a footing of perfect equality." The International Association not having possessed, at the date of the assembling of the Conference, any recognized status, was not formally represented at Berlin, but the flag of the Association having, before the close of the Conference, been recognized as that of a sovereign state by all the Powers, with the exception of Turkey, the Association formally adhered to the General Act.

Thus early in 1885 King Leopold had secured the recognition of the Association as an independent state, but its limits were as yet not clearly defined. On the 5th of February, as the result of prolonged negotiations, France conceded the right of the Association to the course of the Lower Congo below Manyanga, and accepted the Chiloango river and the water-parting of the waters of the Niadi Kwilu and the Congo, as far as beyond the meridian of Manyanga, as the boundary between her possessions and those of the Association on the lower river. From Manyanga the frontier was to follow the Congo up to Stanley Pool, the median line of Stanley Pool, and the Congo again "up to a point to be settled above the river Licona-Nkundja," from which point a line was to be drawn to the 17th degree of longitude east of Greenwich, following as closely as possible the water-parting of the Licona-Nkundja basin. The identity of the Licona-Nkundja subsequently gave rise to considerable discussions with France, and eventually a protocol, signed at Brussels on the 29th of April 1887, continued the boundary along the Congo to its confluence with the Mobangi, whence it followed the *thalweg* of that river to its intersection with the 4th parallel of north latitude, below which parallel it was agreed that the northern boundary of the Congo Free State should in no case descend. In accepting this frontier King Leopold had to sacrifice all claims to the valley of the Niadi Kwilu, in which he had founded fourteen stations, and to the right bank of the Mobangi. With Portugal the Association concluded an agreement on the 14th of February 1885, by which the northern bank of the Congo was recognized as belonging to the Association, while Portugal retained the southern bank of the river as far as Nokki. North of the Congo Portugal retained the small *enclave* of Kabinda, while south of the river the frontier left the Congo at Nokki and followed the parallel of that place to the Kwango river.

***Agreements as to limits.***

In April 1885 the Belgian Chamber authorized King Leopold "to be the chief of the state founded in Africa by the International Association of the Congo," and declared that "the union between Belgium and the new State of the Congo shall be exclusively personal." This act of the Belgian Legislature regularized the position of King Leopold, who at once began the work of organizing an administration for the new state. In a circular-letter addressed to the Powers on the 1st of August 1885, His Majesty declared the neutrality of the "Independent State of the Congo," and set out the boundaries which were then claimed for the new state, but it was not until fifteen years later that the frontiers of the Free State were finally settled. At the date of the issue of the circular the agreements with France and Portugal had partially defined the Free State boundaries on the lower river, and the 30th degree of longitude east of Greenwich was recognized as the limit of its extension eastwards.

The following is a list of the agreements subsequently made with reference to the boundaries of the State (see also Africa, *Recent History*):—

1. 22nd November 1885, with France.—Protocol for delimitation of the Manyanga region.
2. 29th April 1887, with France.—Protocol for delimitation of the Mobangi region.
3. 25th May 1891, with Portugal.—Treaty for delimitation of the Lunda region, and Convention of even date for the settlement of frontiers on Lower Congo.
4. 24th March 1894, with Portugal.—Declaration approving delimitation of Lunda region.
5. 12th May 1894, with Great Britain.—Agreement as to Nile valley and boundaries with British Central Africa.
6. 14th August 1894, with France.—Agreement as to Mbomu river, and Congo and Nile basins.
7. 5th February 1895, with France.—Agreement as to Stanley Pool.

***History.***

The net result of the above agreements is to leave the Congo Free State with France, Portugal, and Great Britain as her neighbours on the north, with Great Britain and Germany as her neighbours on the east, and with Great Britain and Portugal on her southern frontier. The external history of the young state is traced in these agreements. The main object of King Leopold's ambition was to obtain an outlet on the Nile, and for the history of the incidents connected with the two important agreements made in 1894 with Great Britain and France reference must be made to the article Africa. The sacrifices made by the king to attain his object were great, and involved a heavy strain on the finances of the state, reacting on its internal policy. The avowed object of the Free State was to develop the resources of the territory with the aid of the natives, but it early became apparent that the Arab slave traders, who had established themselves in the country between Lake Tanganyika and Stanley Falls and on the upper river, offered an insuperable bar to the realization of this programme. The scanty resources at the disposal of the state imposed a policy of restraint on the officers who were brought into relations with the Arabs on the upper river, of whom Tippu Tib was the chief. In 1886 the Arabs had destroyed the state station at Stanley Falls, and it was apparent that a struggle for supremacy was inevitable. But the Free State was at that time ill prepared for a trial of strength, and at Mr Stanley's suggestion the bold course was taken of appointing Tippu Tip governor of Stanley Falls, as the representative of King Leopold. This was in 1887, and for five years the *modus vivendi* thus established continued in operation. During those years fortified camps were established by the Belgians on the Sankuru, the Lomami, and the Aruwimi, and the Arabs were quick to see that each year's delay increased the strength of the forces against which they would have to contend. In 1891 the imposition of an export duty on ivory excited much ill-will, and when it became known that, in his march towards the Nile, van Kerckhoven had defeated an Arab force, the Arabs on the Upper Congo determined to precipitate the conflict. In May 1892 the murder of M. Hodister, the representative of a Belgian trading company, and of ten other Belgians on the Upper Lomami, marked the beginning of the Arab war. When the news reached the lower river a Belgian expedition under the command of Commandant (afterwards Baron) Dhanis was making its way towards Katanga. This expedition was diverted to the east, and, after a campaign extending over several months, during which several battles were fought and the Arab strongholds of Nyangwe and Kasongo were captured, the Arab power was broken and many of the leading Arabs were killed. The political and commercial results of the victory of the Free State troops are thus described by Captain Hinde, who was Baron Dhanis's second in command:—"The political

geography of the Upper Congo basin has been completely changed, as a result of the Belgian campaign against the Arabs. It used to be a common saying in this part of Africa that all roads lead to Nyangwe. This town, visited by Livingstone, Stanley, and Cameron, until lately one of the greatest markets in Africa, has ceased to exist, and its site, when I last saw it, was occupied by a single house. Kasongo, a more recent though still larger centre, with perhaps 60,000 inhabitants, has also been swept away, and is now represented by a station of the Free State nine miles away on the river bank. In harmony with this political change the trade routes have been completely altered, and the traffic which used to follow the well-beaten track from Nyangwe and the Lualaba across Tanganyika to Ujiji, or round the lake to Zanzibar, now goes down the Congo to Stanley Pool and the Atlantic."

These results had been attained largely by the aid of native levies and allies, and a number of the men who had taken part in the Arab campaign were enlisted as permanent soldiers by the Belgians. Among these were some Batetelas, who in 1895 revolted in the Lulua and Lomami districts. The mutineers were eventually defeated; but in 1897, while Baron Dhanis was making his way with a large expedition towards the Nile, the Batetelas again revolted, murdered several of their white officers, and took possession of a large area of the eastern portions of the state. Although defeated on several occasions by the Free State forces, the mutineers were not finally dispersed until near the end of 1900, when the last remnants were reported to have crossed into German territory and surrendered their arms.

The international position of the Free State is a somewhat anomalous one. It is an independent state administered as if it were a colony. By his will dated the 2nd August 1889, King Leopold bequeathed to Belgium "all our sovereign rights over the Independent State of the Congo, as they are recognized by the declarations, conventions, and treaties concluded since 1884 between the foreign Powers on the one side, the International Association of the Congo and the Independent State of the Congo on the other, as well as all the benefits, rights, and advantages attached to that sovereignty." It was subsequent to the execution of this will that the Belgian State in July 1890 acquired the right, already referred to, of annexing the Free State in ten years and six months from that date. In the year 1895, owing to its financial difficulties, the Free State was obliged to ask the consent of the Belgian Government to a project for raising a further loan. The Belgian Ministry of that time believed the occasion opportune for advancing the date of the annexation of the Free State as a Belgian colony. A Bill was introduced with this object into the Belgian Legislature, but after long delays and a violent Press campaign the Ministry fell, the Bill was withdrawn, and the Chambers voted a further loan to the Free State to enable it to tide over its immediate difficulties. However, either on the decease of the sovereign, or at some earlier date, the Belgians must come to a decision whether or not they will accept the responsibility for King Leopold's African kingdom. In the event of their refusal, the right of pre-emption given to France by the International Association in 1884 might give rise to questions of a somewhat complicated and serious character.

***International position.***

Except for its short coast-line on the Atlantic, and for a small area on its north-eastern frontier, the Free State lies wholly within the geographical basin of the Congo. It may roughly be divided into three zones—(1) the small coast zone west of the Crystal Mountains, through which the Congo breaks in a succession of rapids to the Atlantic; (2) the great central zone bounded on the north by the Congo and the Mobangi river, on the east by the Mitumba range of mountains, and on the south by the Congo-Zambezi watershed and the Portuguese frontier; and (3) the smaller zone east of the Mitumba range, including the upper courses of some of the Congo tributaries which have forced their way through the mountains, and west of Lake Mweru and the upper course of the Luapula, as well as a small area which belongs geographically to the Nile valley. The Crystal Mountains form the western edge of the Great Central African plateau and run, roughly, parallel to the coast. The Mitumba range extends from Mount Kaomba, on the southern frontier of the Free State, in a north-easterly direction to Lake Tanganyika, and then strikes northwards along the western shore of that lake, past Lakes Kivu and Albert Edward to Albert Lake, forming the western edge of the Great Central African rift valley. This immense mountain chain has numerous subsidiary local names. It varies in altitude from 5000 to 10,000 feet. Baumann estimates its height where it forms the western limit of the Rusisi valley at the latter figure, while to the west of Lake Kivu von Götzen calculates it at 9000 feet. The eastern escarpment is precipitous, but on its western face it slopes more gently into the Congo basin. North of the Lukuga river the main chain throws out into the Central zone, in a north-westerly direction, a secondary range, known as the Bambara Mountains, which forms one of the boundaries of the Manyema country. The interior, or Lake, zone is a high plateau with an average elevation of 3000 feet above sea-level. The Central zone dips with a westerly inclination from the Mitumba Mountains towards the western edge of the plateau. It is described by Wauters as "a country of alluvial plains, without any marked mountain features, very well watered, covered with forests and wooded savannahs." The Coast zone is small in area, dipping down from the Crystal Mountains to the Atlantic, where the Free State frontier is reduced to some 20 miles of coast-line. The Congo and its tributary streams form, both from the point of view of the physical geography and the commercial development of the Congo Free State, its most important feature; but next in importance are the immense forests which clothe the banks of the rivers, the remains of the great forest which appears at one time to have covered the whole of the centre of the continent. The wooded savannahs, where it is anticipated that in the course of time numerous herds of cattle may be reared, are mostly situated on the higher lands of the Central zone, where the land dips down from the Mitumba Mountains to the Congo.

***Physical features.***

*Climate.*—Situated on the Equator, between about 5° N. and 11° S. lat., the Congo Free State shows only a slight variation of temperature all the year round. From July to August the heat increases slightly, with a more rapid rise to November. During December the thermometer remains stationary, and in January begins to rise again, reaching its maximum in February. March is also a month of great heat; in April there is a steady decline into May, with a more rapid decline in June, the minimum being reached again in July. There is a marked distinction between the wet and dry seasons in the western districts on the Lower Congo, where rains fall regularly from October to May, the dry season being from June to September. But nearer the centre of the continent the seasons are less clearly marked by the amount of precipitation, rain falling more or less regularly at all times of the year. The seasons of greatest heat and of the heavy rains are thus coincident on the lower river, where fever is much more prevalent than on the higher plateau lands nearer the centre of the continent. The amount of the rainfall shows great variations in different years, the records at Banana showing a total fall of 16 inches in 1890–91 and of 38 inches in 1893–94. Even in the rainy season on the lower river the rain does not fall continuously for a long period, the storms rarely lasting more than a few hours, but frequently attaining great violence. The greatest fall registered as occurring during a single tornado was 6 inches at Bolobo. In July grass fires are of common occurrence, and frequently sweep over a great expanse of country. Mons. A. Lancaster, the Belgian meteorologist, has formulated, as the result of a study of all the available data, the following rule:—That the rainfall increases in the Congo basin (1) in proportion as one nears the Equator from the south, (2) as one passes from the coast to the interior. On the Lower Congo the prevailing winds are from the west and the south-west, but this prevalence becomes less and less marked towards the interior, until on the upper river they come from the south-east. The wind, however, rarely attains any exceptional velocity. Storms of extreme violence, accompanied by torrential rain, and in rare instances by hailstones, are of not uncommon occurrence. On the coast and along the course of the lower river fogs are very rare, but in the interior early morning fogs are far from uncommon. Europeans are subject to the usual tropical diseases, and the country is not suited for European colonization.

*Area and Population.*—The area is roughly estimated at 900,000 square miles, and the native population is variously estimated at from 30,000,000 (Stanley) to 14,000,000 (Saint Martin). The

estimated area is probably above rather than below the proper figure. The vast bulk of the population belongs to the Bantu stock, but there are found, in the great forests along the river banks, sparsely distributed bands of the pigmy people, who probably represent the aboriginal inhabitants of Central Africa. In the north-eastern corner of the State, in the upper basin of the Welle and the Mbomu, the Azandé, a race of warriors and hunters with a social, political, and military organization superior to that of the Bantu tribes of the Congo basin, had intruded from the north, and were forcing their way southwards towards the Congo when the agents of the State appeared in that region and arrested their farther progress. Traces of Arab blood are still found in the districts where the slave traders from the east coast had established stations. The European population at the end of 1886 numbered 254, of whom 46 were Belgians. In 1890 there were 744 Europeans, of whom 338 were Belgians; in 1895, 1076, of whom 691 were Belgians. In January 1900 the European population was as follows:—Belgians, 1187; Italians, 176; British, 99; Dutch, 95; Swedes, 81; Portuguese, 72; French, 53; Germans, 42; Danish, 39; Americans, 33; Norwegians, 25; Swiss, 13; Austrians, 7; Spaniards, 6; and other nationalities, 30,—a total of 1958.

*Stations.*—There are no large towns in the European sense, but a number of stations have been established, some of which have acquired a certain importance and have become the centre of a comparatively large European population. Of these, *Boma* is the headquarters of the local administration, and the residence of a British vice-consul. It is situated on the right bank of the Lower Congo, about 60 miles from its mouth, is one of the principal ports of call for steamers, and the centre of a considerable trade. In 1899 the number of steamers entering the port of Boma was 84, of 164,035 tons, and the number of coasting vessels 196, of 6485 tons. *Banana*, close to the mouth of the Congo and Banana Point, possesses one of the best natural harbours on the west coast of Africa, and is capable of sheltering vessels of the largest tonnage. There are a number of European factories, some of them dating from very early days, and the place is still the centre of a considerable commerce. The French consulate is situated at Banana. In 1899 the number of seagoing vessels entering the port was 108, of 205,610 tons, and the number of coasting vessels 244, of 13,353 tons. *Matadi* is situated on the left bank of the Congo, at the highest point of the lower river which can be reached by seagoing vessels. It is the point of departure of the Congo Railway. The railway company has constructed two jetties at which steamers can discharge their cargo. Matadi is probably destined to eclipse both Boma and Banana as a port, but at present no statistics are available as to the number or tonnage of the vessels calling there. *Lukunga*, situated on the banks of the river of that name, a southern tributary of the Congo, about half-way between Matadi and Stanley Pool, was formerly the capital of the Falls district, and the chief recruiting station for porters on the Lower Congo. *Tumba*, the present capital of the district, is a station on the Congo Railway, the half-way house between Matadi and Stanley Pool, where the trains stop for the night. It is about 117 miles from Matadi and 143 from Ndolo, the terminus of the railway on Stanley Pool. *Ndolo* is situated a short distance from the Pool, and has two channels by which vessels can enter and leave the port. Extensive works have been undertaken, and it is intended to make Ndolo the headquarters of the steamers that ply on the inland waterways. Quays and a slip for launching vessels have been constructed. *Leopoldville* is the capital of the Stanley Pool district, and was one of the earliest stations founded by the Association. It is situated about 7 miles from Ndolo on the flanks of Mount Leopold, and it is considered probable that it may some day supplant Boma as the headquarters of the administration, when the increased importance of the middle and upper river regions makes it necessary to move the centre of administration from the lower river. Other places of importance are *Luluaburg*, on the Lulua river; *Lusambo*, the capital of the Lualaba-Kasai district, on the Sankuru river; *Coquilhatville*, the capital of the Equatorial district, at the mouth of the Ruki; *Stanley Falls*, the principal station of the district of that name; *New Antwerp*, a thriving little town, the capital of the Bangala district, situated on the right bank of the Congo close to the 19th parallel of east longitude; *Banzyville*, the capital of the Mobangi district, on the river of that name; *Basoko*, at the junction of the Aruwimi and the Congo; and *Nyangwe*, which is beginning to recover some of the importance it possessed before it was destroyed in the Arab campaign of 1892-93. *Djabir* is the capital of the Welle district, and in the leased territories on the Upper Nile valley the principal places are *Rejaf*, *Lado*, *Dufile*, and *Wadelai*.

*Constitution.*—The Free State is an absolute monarchy, but the Sovereign has never set foot in his African territory, which is administered from Brussels. There is no "constitution," but King Leopold's power is circumscribed in certain directions by the General Act of Berlin, to which the Free State adhered in 1885, by which freedom of trade and free navigation of the Congo and its affluents are secured. Civil and criminal codes have been promulgated by decrees, and in both cases the laws of Belgium have been adopted as the basis of legislation, and modified to suit the special requirements of the Free State. In addition to the decrees, which are signed by the Sovereign and countersigned by the Secretary of State, provision is made for the issue of Regulations and Ordinances by the Governor-General. The Governor-General may, in case of urgency, issue an Ordinance suspending for a limited period a Decree issued by the Sovereign. Ordinances issued by the Governor-General remain in force for six months, at the termination of which period they expire, unless they have in the meantime been superseded by Decree. All Decrees are published in the *Bulletin Officiel*, which is issued monthly at Brussels. The Sovereign is assisted in the task of government by a Secretary of State, whose duty it is not only to countersign all Decrees, but to superintend their execution. There are three Departments of State, each presided over by a Secretary-General in subordination to the Secretary of State. These departments are:—(1) Foreign Affairs, (2) Finance, (3) Interior. There is also a Treasurer-General, and a chief of the Cabinet of the Secretary of State. All these officials have their headquarters at Brussels.

**Administration.**

The headquarters of the local administration are at Boma, on the lower river, the King being represented by a Governor-General, who is the head both of the naval and military authorities. He is assisted by a Deputy Governor-General, by a number of Inspectors, a Secretary-General, and several Directors. A Consultative Committee or Council of the heads of the various departments and higher officials advises the Governor-General on all matters which he may lay before it. There are seven departments of the Administration:—(1) Justice, (2) Transports, Marine and Public Works, (3) Superintendence of State Lands, (4) Agriculture and Industry, (5) Defence, (6) Force Publique, and (7) Finance. For administrative purposes the Free State is divided into 14 districts, each of which is governed by a Commissary, with a staff of Assistant Commissaries, Sub-Commissaries, and clerks. The districts are Banana, Boma, Matadi, Falls, Stanley Pool, Kwango Oriental, Mobangi, Stanley Falls, Lualaba-Kasai, Lake Leopold II., Equator, Aruwimi, Bangala, and Welle. In 1898 the territory in the valley of the Upper Nile leased from Great Britain was placed for administrative purposes under the same régime as the districts.

*Judicial Machinery.*—Until May 1897 the Upper Congo was under military law, but from that date civil law has been administered throughout the State, wherever the authority of the State extended. Courts of First Instance have been instituted in the various districts, and there is a Court of Appeal at Boma which revises the decisions of the inferior tribunals. There is a further appeal, in all cases where the sum in dispute exceeds a thousand pounds, to a Superior Council at Brussels composed of a number of jurisconsults, who sit as a Cour de Cassation. In consequence of repeated charges of the ill-treatment of natives being made against officers of the Administration, King Leopold instituted a Commission for the Protection of Natives, and nominated several missionaries of different denominations to serve on it. It is the duty of the Commission to report to the judicial authorities, or to the Governor-General, any cases of the ill-treatment of the natives which may come to the knowledge of its members.

*Religion and Instruction.*—The native population are pagans, fetish worshippers, and on a very low plane of civilization. The State makes no provision for their religious teaching, but by the Berlin Act missionaries of all denominations are secured perfect freedom of action. The State has established three agricultural and technical colonies for lads up to the age of fourteen. Each of these colonies, which are situated at Boma, Leopoldville, and New Antwerp, makes provision for the training of five hundred boys, who are recruited from those rescued from slavery, from orphans, and from children abandoned or neglected by their parents. Practical instruction is given in various subjects, but the main object is to provide recruits for the armed force of the State, and only such lads as are unfitted to be soldiers are drafted into other occupations. A few native children are sent to Belgium to be educated. Missionaries have displayed great activity on the Congo, and are encouraged by the Administration. In 1900 there were 300 missionaries, of whom 180 were Roman Catholics and 120 Protestants, scattered among 76 mission stations. The missionaries do not confine themselves to religious instruction, but seek to raise the general level of the native population. In many districts cannibalism is rife, and degrading ceremonies are practised. There are two Roman Catholic bishops, one of whom resides at Leopoldville, the other at Baudouinville, and Roman Catholic churches for the European population are maintained at Boma and Matadi.

*Finance.*—In the years that preceded the founding of the Congo Free State the funds for carrying on the work of the International Association of the Congo were provided by King Leopold out of

His Majesty's privy purse, and for some time after the recognition of the Free State this system was continued. Mr Demetrius Boulger states that, in the first ten years of his work on the Congo, King Leopold spent £1,200,000 from his private fortune. The first five years of the existence of the new State were greatly hampered by the provision of the Berlin Act prohibiting the imposition of any duties on goods imported into the Congo region, but at the Brussels Conference, in the summer of 1890, a declaration was signed by the Powers signatory to the Berlin Act authorizing the imposition of import duties not exceeding 10 per cent. *ad valorem*, except in the case of spirits, which were to be subject to a higher duty. By agreement with France and Portugal, a common tariff was adopted by these Powers and the Congo Free State. In the same year the Belgian Government agreed to advance 25 millions of francs without interest, 5 millions to be paid at once and the balance in annual payments of 2 millions spread over ten years. At the end of that period Belgium acquired the option of taking over the Free State as a Belgian colony. At the same time the King undertook to make an annual contribution of a million francs out of his privy purse to the revenue of the State. In addition to the 2 million francs per annum received from Belgium, the 1 million francs from the King, and the proceeds of the Customs, the State derives a small portion of its revenues from direct taxation of the European population, but it is mainly dependent on the profits derived from the State domains. The Free State is in fact a great commercial undertaking as well as a governing body. It has established plantations in various parts of the State domains, or Crown lands, but these are mainly in the experimental stage, and the bulk of the revenue from the State domains is derived from the collection of caoutchouc, or rubber, from the forest, and the trade in ivory. In 1886 the total revenue of the State only amounted to 74,261 francs. The following table shows the revenue and expenditure as set forth in the Budgets in 1891, the first year in which complete figures are available, and at intervals since that year :—

| Year. | Revenue. | Expenditure. |
|---|---|---|
| | Francs. | Francs |
| 1891 | 4,554,931 | 4,554,931 |
| 1895 | 6,004,764 | 7,370,939 |
| 1898 | 14,765,050 | 17,251,975 |
| 1899 | 19,966,500 | 19,672,965 |
| 1900 | 26,256,500 | 27,731,254 |

The Budget for 1900 estimated the revenue and expenditure as follows :—

| Revenue | | Expenditure. | |
|---|---|---|---|
| | Francs. | | Francs. |
| Advance by Belgium | 2,000,000 | Central Office | 110,360 |
| Grant by King | 1,000,000 | Dept. of Interior | 11,050,013 |
| Customs | 4,680,000 | ,, Finance | 15,423,681 |
| Transport, &c. | 3,800,000 | ,, Foreign Affairs and Justice | 158,000 |
| State Domain, &c. | 11,200,000 | | |
| Portfolio | 2,950,000 | | |
| Various | 626,500 | Contingencies | 989,200 |
| | 26,256,500 | | 27,731,254 |

The following table shows the rapid advance made in the revenue derived from the State domains :—

| Year. | From State Domains. |
|---|---|
| | Francs. |
| 1886 | 74,261 |
| 1891 | 1,319,145 |
| 1896 | 5,887,404 |
| 1900 | 11,200,000 |

In July 1887 bonds bearing interest at $2\frac{1}{2}$ per cent. were issued to the amount of 11,087,000 francs to represent sums advanced to the old Committee and Association, the advantage of which was taken over by the Free State. The bulk of these bonds were issued to King Leopold, but in January 1895 His Majesty cancelled the bonds in his possession, and in 1901 there only remained an indebtedness of 422,200 francs in respect of this issue. In 1888 and 1889 bearer bonds to the amount of 70 million francs were issued out of an authorized issue of 150 million francs. These bonds are redeemable in 99 years by annual drawings, and are entitled to an addition of 5 per cent. per annum when drawn. The Redemption Fund is administered by a Committee representing the bondholders. The Belgian Government in 1890 advanced the 25 million francs already referred to, without interest, as well as two further sums of 5,287,415 francs and 1,517,000 francs, the former to enable the State to repay a loan and so prevent the forfeiture of an immense territory which had been pledged as security to an Antwerp banker, and the latter to balance the 1895 Budget. In October 1896 a small loan of 1,500,000 francs was raised at 4 per cent., and in June 1898 a further sum of 12,500,000 francs was raised at the same rate of interest. The Central Administration has experienced considerable difficulty in adjusting the State's revenue and expenditure, and, apart from other considerations, it is extremely probable that the increasing difficulty of providing funds will oblige the Belgian Government to assume direct responsibility for the Congo territories.

*Defence.*—The Administration was at first compelled to recruit soldiers among races outside the State territories, but in 1886 a small beginning was made in recruiting among the local tribes. The greater part of the army consisted in 1901 of locally-raised levies, recruited partly by voluntary enlistment and partly by the enforced enlistment of a certain number of men in each district, who are selected by the Commissary in conjunction with the local chiefs. In 1899 the effective force was fixed at 11,850 men, divided into 23 companies, and commanded by 200 European commissioned officers and 241 sergeants. The term of service for volunteers does not exceed seven years, while the militiamen raised by enforced enlistment serve for five years on active service, and for two years in the reserve. The men are armed with the Albani, the officers with the Mauser rifle. There are seven camps of instruction, and the artillery includes Krupps, Maxims, and Nordenfeldts. A fort has been erected at Chinkakassa near Boma, commanding the river below the Falls, and there is another fort at Kinshassa on Stanley Pool to protect Leopoldville and the railway terminus. The Governor-General is Commander-in-Chief of the armed forces of the State, and the Commissaries are in command of the military forces in their districts. In the 1891 Budget the expenditure on the army was given at 2,271,628 francs; in 1896 it had risen to 4,820,793 francs; in 1898, to 6,870,631 francs; and in 1900, to 7,803,408 francs.

*Land and Production.*—On the 1st of July 1885 it was decreed that "unoccupied lands are considered as belonging to the State." There are three forms of ownership recognized in the Free State—(1) the right of the natives to land in their actual occupation; (2) private ownership by Europeans of land which they have acquired, and of which they are the registered owners; and (3) State ownership of all the land not included in either of the two former categories. The system of land registration adopted was based on the Torrens system, and offers great facilities for easy transfer. There is a separate department for the management of the Domain or Crown lands. Plots for factories and blocks of agricultural land are sold at certain fixed rates, but the main contribution to the State revenue from the Domain lands is obtained, as has been seen, from the collection of rubber and ivory. In 1891 and 1892 the State endeavoured to obtain a monopoly of the rubber trade, and circulars were issued to the Commissaries in certain districts instructing them that not only was the collection of rubber by the natives to be regulated, but that in future the natives were to be compelled to sell their rubber to the State. Vigorous protests by the private trading companies were made against this attempted violation of the freedom of trade secured by the Berlin Act, and eventually the circulars were withdrawn and an arrangement made by which certain areas were reserved to the State and certain areas to private traders; while the question of the régime to be established in the basins of the Lualaba, the Upper Lomami, and in Urua and Katanga was reserved until such time as these districts were more effectually brought under control.

***Resources.***

*Minerals.*—Comparatively little is known of the mineral wealth of the country. Iron is widely distributed, and worked in a primitive fashion. It has been found in the Manyanga country, the Manyema country, on the Upper Congo, in the Urua country, in the basins of the Kasai and the Lualaba, and in Katanga. Immense ironstone hills, estimated to contain millions of tons of ironstone of superior quality, have been reported in the south-eastern region. The wealth of Katanga in copper has been described by several travellers, and the expedition sent out in 1891 reported that the richest deposits are to be found in the southern districts on the bank of the Lufira river. Copper is also reported in other districts, such as Mpala and Ulvira on Lake

Tanganyika. Gold has been discovered in Katanga, but before the advent of Europeans was held in less repute than copper. Lead, tin (Mobangi basin), sulphur, and mercury are also reported to exist, but until the introduction of European methods it is impossible to say what are the mineral resources of the Congo region, and whether they can be worked at a profit.

*Animal and Vegetable Products.*—Elephant and hippopotamus ivory formed for some years the most important article of export. When Europeans first entered the Congo basin the natives were found to have large stores of "dead ivory" in their possession. These stores are still being drawn on for export, supplemented by the "live ivory" obtained by the killing of elephants in the present day. In July 1889, as a precaution against the extermination of the elephant, the King issued a degree prohibiting the killing of elephants without special permission. Large herds still exist in the Congo forests, especially in the eastern and north-eastern districts. A reference to the commercial statistics will show that ivory is still the second most important export from the Free State. It is, however, a bad second to caoutchouc, the rubber of commerce, which is obtained from the rubber-bearing liana—*Landolphia florida*—which exists in practically inexhaustible quantities. [illegible] the value of the rubber exports only amounted to 159,000 francs. In 1900 the value had risen to 28,973,505 francs. Palm oil, palm nuts, gum copal, and timber are other natural products which swell the volume of exports, though not at present to any considerable extent. Timber is as yet only exported to the value of between £3000 and £4000, but the vast forests contain many trees, the wood of which is sufficiently valuable to pay the cost of transport to Europe. Ebony, teak, African cedar, mahogany are a few only of the woods that abound on the Congo. Coffee and tobacco are found in a wild state, and there is an immense number of fruit-bearing trees, and of plants yielding spices and essences which may in time be turned to profitable account.

*Agriculture.*—Until the advent of Europeans the natives, except in the immediate neighbourhood of some of the Arab settlements, did little more than cultivate small patches of land close to their villages. They grew bananas, manioc, the Spanish potato, the sugar cane, maize, sorghum, rice, millet, eleusine, and other fruits and vegetables, as well as tobacco, but the constant state of fear in which they lived, both from their neighbours and from the Arabs, offered small inducement to industry. Future agricultural development will depend on the success which attends the efforts to turn the native into a regular labourer. Plantations have been established both by the State and by private companies, and already small quantities of coffee, cocoa, tobacco, and maize have been exported. There are no statistics of the number of domestic animals in the country, but there is a number of horses, mules, donkeys, cattle and pigs, and it is believed that cattle-rearing may be profitably undertaken in the eastern portions where the country rises towards the Mitumba Range, when the political conditions and improved transport arrangements make such an experiment possible.

*Industries.*—In some districts the natives possess considerable skill in working in wood, ivory, and metals, but the Congo industries are at present purely local. Iron and copper are extracted by certain tribes, which enjoy a practical monopoly of this kind of work. The knives, spears, and shields of native workmanship frequently show both ingenuity and skill, alike in design and in execution. European fabrics have, among the tribes nearest the coast, already affected the weaving of cloths by the natives, but over a great part of the State territory the natives still manufacture cloth from vegetable fibres. They employ four different colours, yellow, the natural colour, black, red, and brown, which are obtained by dyeing, and these colours they combine into effective designs. In some tribes a rude form of printing designs on cloth is practised, and on the Sankuru and Lukenye a special kind of cloth, with a heavy pile resembling velvet, is made by the Basongo-Meno and other tribes.

*Commerce.*—The following table shows the total exports under the headings—(1) Special Commerce, which includes only such articles as originate from the Congo Free State; and (2) General Commerce, which includes exports of all kinds from the Free State, whatever their place of origin:—

| Year. | Special. | General. |
|---|---|---|
| 1887 . . . | 1,980,441 | 7,667,949 |
| 1890 . . . | 8,242,199 | 14,109,781 |
| 1895 . . . | 10,943,019 | 12,135,656 |
| 1898 . . . | 22,163,482 | 25,396,706 |
| 1899 . . . | 36,067,959 | 39,138,283 |

The following table shows the value of the principal products exported from the Free State (Special Commerce) at three periods:—

| Articles. | 1887. | 1895 | 1899. |
|---|---|---|---|
| | Francs. | Francs | Francs |
| Caoutchouc . . | 116,768 | 2,882,585 | 28,100,917 |
| Ivory . . . | 795,700 | 5,844,640 | 5,834,620 |
| Palm nuts . . | 590,781 | 1,242,898 | 1,293,413 |
| Palm oil . . | 462,609 | 935,658 | 734,511 |
| Timber . . | . . | 12,200 | 91,312 |
| Miscellaneous . | 14,583 | 25,038 | 13,186 |
| | 1,980,441 | 10,943,019 | 36,067,959 |

The increasing importance of the trade with Belgium is shown in the following table, in which will be found the value of the general exports to Belgium, Holland, and Great Britain at three periods:—

| Country. | 1890 | 1895. | 1899. |
|---|---|---|---|
| | Francs. | Francs | Francs. |
| Belgium . . | 2,217,599 | 8,999,660 | 32,367,828 |
| Holland . . | 8,073,208 | 885,405 | 1,656,561 |
| Great Britain . | 833,941 | 592,496 | 281,593 |

The first year for which full statistics of imports are available is 1893. The following table shows the Special and General Imports in that year and in two subsequent years. "Special" imports are goods intended for consumption immediately on their arrival, or on their being taken out of the entrepôt:—

| Year. | Special. | General. |
|---|---|---|
| | Francs. | Francs. |
| 1893 . . . | 9,175,103 | 10,148,418 |
| 1897 . . . | 22,181,462 | 23,427,197 |
| 1899 . . . | 22,325,846 | 27,102,581 |

Of the special imports in 1899, Belgium sent 15,592,745 francs; Great Britain, 2,922,739; Germany, 1,359,688; and Holland, 882,426. The principal articles imported in 1899 were textile fabrics and clothing, 5,147,610 francs; food substances, 3,887,912; steamers and machinery for steamers, 2,704,819; drinks, 1,718,627; metal and metal goods, 1,667,391; machinery other than for steamers, 1,492,310; arms, ammunition, &c., 932,073.

*Shipping and Navigation.*—There is a fortnightly service of steamers between Antwerp and Boma and Banana. There is also frequent steam communication with Liverpool, Hamburg, Rotterdam, and Lisbon. In 1899 there entered at Boma and Banana 192 seagoing vessels of 369,645 tons, and cleared 197 vessels of 375,715 tons. Of the tonnage entered, 191,843 was Belgian; 79,037, British; and 65,682, German. Of the tonnage cleared 189,933 was Belgian; 85,588 was British; and 67,113, German. During the same year 440 coasting vessels of 19,838 tons entered, and 451 vessels of 20,557 tons cleared from the same ports.

*Internal Communications.*—From the mouth of the Congo to the beginning of the rapids, which render the river unnavigable—a distance of about a hundred miles—the State maintains a fleet of seven steamers, in which passengers and goods are transported from the larger ocean-going steamers to Matadi, the point of departure of the railway. Matadi can, however, be approached by ships of considerable burden. Before the railway, all merchandise and goods for the interior had to be carried by porters from the coast to Stanley Pool. This method was both costly and inconvenient. The journey took three weeks. In 1887 the King granted to the Congo Industrial and Commercial Company a concession to construct a railway from the lower river to Stanley Pool, and, after a survey had been made, a Congo Railway Company was founded in Brussels in July 1889, with a capital of 25 million francs, of which the Belgian Government subscribed 10 millions. The moving spirit in this great enterprise was Colonel Thys. The work was begun almost immediately, but nearly insuperable difficulties were encountered, both engineering and financial. The line was finally completed in March 1898, and formally opened to traffic in the following July—nine years after its practical inception. The length of the line is 260 miles, and its inland terminus is at Ndolo on Stanley Pool, a short distance from Leopoldville. There

is a weekly service of three passenger trains in each direction, two days being occupied on the journey. The trains do not run during the night. The single through fare for Europeans is £20, and the freight charges are proportionately high, judged by European standards, though considerably below the charges which had to be paid before the railway was built. The cost of constructing and equipping the railway was 68 millions of francs. Other railways which are projected are a short line from Boma to the Lukulu river, for the purpose of opening up the Mayumbe province; a line or lines of railway between the navigable waters of the Upper Congo and Lake Tanganyika, with subsidiary lines which would develop the rich provinces of Manyema, Urua, and Katanga; and a railway in the Upper Welle district, for the purpose of opening up the north-eastern provinces and affording rapid access to the leased territories on the Upper Nile.

*Waterways.*—It is, however, in the splendid navigable waterways of the main Congo stream and its tributaries that the Free State has found, and will continue to find, its most powerful instrument in the development of its resources. For a full account of the river and its tributaries reference may be made to the article on the Congo River, but the following table, printed in the *Mouvement Géographique*, shows approximately the extent of the waterways open to navigation:—

| | | | |
|---|---|---|---|
| Congo (from Stanley Pool to Stanley Falls) | 990 miles | Lake Mantumba | 220 miles |
| Lefini | 70 ,, | Mobangi | 750 ,, |
| Kasai | 500 ,, | Nghiri | 140 ,, |
| Mfini Lukeyma | 680 ,, | Ibenga | 90 ,, |
| Lake Leopold II. | 590 ,, | Lebai | 60 , |
| Kwango | 220 ,, | Ombéla | 50 ,, |
| Juma | 400 ,, | Kuangu | 80 ., |
| Sankuru | 400 ,, | Ruki | 530 ,, |
| Lubefu | 140 ,, | Momboyo | 370 ,, |
| Lubi | 60 ,, | Lulonga | 400 ,, |
| Lulua | 160 ,, | Lopori | 280 ,, |
| Alima | 200 ,, | Mangala | 230 ,, |
| Dikwalea | 200 ,, | Rubi | 90 ,, |
| Sanga | 560 ,, | Aruwimi | 160 ,. |
| Goko | 100 ,, | Lomami | 470 ,, |
| Mambéré | 160 ,, | Total | 9350 miles |

The State maintains on these waterways a fleet of steamers which in 1900 numbered 26 vessels, for the purpose of preserving authority, provisioning the stations, promoting trade, and operating the postal service. Private trading companies, French, Belgian, and Dutch, and several Missionary Societies also maintain steamers on the inland waters, and the number is being rapidly increased since the docks have been built at Ndolo and the railway offers increased facilities for transport. Away from the railway and the waterways, transport is still mainly effected by porters.

*Posts and Telegraphs.*—The Free State is included in the Postal Union. There were in 1899, 20 post offices. Steamers leave Leopoldville at regular intervals with mails. In 1898 the postal authorities dealt with 103,032 letters, papers, and other postal matter in the internal service, and with 343,077 in the external service. There is not as yet any direct cable communication with Europe, messages being sent either *viâ* St Thomas or *viâ* St Paul de Loanda. In 1893 a Decree was issued authorizing the construction of a telegraph line from Boma to Lake Tanganyika. In 1895 the line had been made as far as Matadi, and in 1898 it reached Stanley Pool simultaneously with the railway. The line is an aërial one, and is now being carried up the banks of the river towards Stanley Falls, while an expedition under Mr Mohun, an ex-Consul of the United States, was in 1900 engaged in constructing the line from the Tanganyika end. In 1898 a Decree authorized the construction of two branch lines to Rejaf, in the Upper Nile valley, and to Katanga. There is a telephone from Matadi to Stanley Pool, following the railway line.

*Trading and Exploring Companies.*—There are no banks in the Free State, financial operations being conducted either by the State or by the private companies which have been founded principally by Belgian capitalists. Mr A. J. Wauters, Secretary-General of the Compagnie du Congo pour le Commerce et l'Industrie, which was established in December 1886, and has promoted several subsidiary companies, including the Congo Railway Company, says that in 1898 there were 25 companies represented in the Free State, which had been founded in Belgium, Holland, and Portugal, with a total capital of about 60 millions of francs. Half of this sum was represented by the capital of the railway company, the next largest companies in point of capital being the Belgian Company of the Upper Congo, with a capital of 5 millions of francs, and the Katanga Company with 3 millions. There were other five companies, with their headquarters in the Free State, which had been founded by virtue of special Decrees issued by King Leopold, and were subject to the law of the Congo Free State. The capital of two of these companies is not stated, but the other three have a joint capital of 6½ millions of francs. By a Decree issued on the 7th of February 1896 the King authorized the issue of State notes payable to bearer, and a first issue of 400,000 francs was sanctioned. These notes are payable at the State Treasury at Brussels, and are accepted by the State in payment of moneys due to it.

**Congregationalism.**—Congregationalism as a designation of a Christian denomination has of late in some respects modified its significance. In Great Britain there is to be observed among Congregationalists a growing tendency towards a mutual connexion or combination of churches, as distinguished from a bare Independency. This movement is seen not only in the multiplying of conventions and conferences for religious and educational purposes, but also in more permanent forms of ecclesiastical federation. It appears in the increased vigour and influence of the Congregational Union of England and Wales, which are manifest, for example, in the series of volumes entitled *Congregational Lectures*, together with the Hymnals, all of which have been issued under its auspices. The merging of the Evangelical Union of Scotland in the Scottish Congregational Union is a circumstance illustrating the prevailing tendency. It may be added that the participation of the British Congregational

***Great Britain.***

churches with their foreign brethren of the same ecclesiastical form in two international councils, is one sign of the prevailing disposition to unite with the continued self-government of each local church a closer connexion with churches abroad as well as at home. The various local unions of Congregationalists in England likewise indicate a spirit which is in marked contrast with the isolation of earlier times. It is to be observed, however, that the system of councils, with their part not only in the adjustment of differences but also in the ordination and installation of ministers—the system which has been in America a distinguishing feature of Congregationalism,—has not gained a place in the British Congregational churches. The work accomplished by Congregationalists in England during the last few decades in providing new means of education, in particular for the education of ministers, is worthy of special remark. The establishment of Mansfield College at Oxford, by the transformation of Spring Hill College, Birmingham, through the act of Dr Dale and his co-trustees, was an event of much consequence in its direct effect in elevating the character of the ministry, not to dwell on its stimulating influence in other directions. The newly constituted University for London is of much service to Congregationalists, as well as to other Nonconformists, by having a Faculty of Theology, and by affiliating their theological colleges, all of whose professors are recognized as theological teachers. In 1870 there were 3069 Congregational churches in Great Britain and Ireland, in 1900, 4851; in 1870, 2468 ministers, in 1900, 3132: in the British colonies, in 1870, 296 churches, in 1900, 765; in 1870, 236 ministers, in 1900, 459. In 1900 in Great Britain and Ireland there were 1,733,065 church sittings, and 415,664 church members; 684,006 Sunday-school pupils, 64,334 teachers, and 5484 lay preachers.

Congregationalism in America has spread from New England, its primitive home, over the West to the Pacific, but has never had more than a slight foothold in the Southern States of the Union. The remarkable junction or fusion of the Independents or "Separatists" who emigrated from Leyden to Plymouth, Massachusetts, with the Puritan Nonconformists of Massachusetts Bay, modified Independency by the introduction of positive fraternal relations among the churches. This gave rise to Congregationalism in the more proper sense of the term. Beyond the limits of New England the progress of the denomination was a good deal hindered for a long period by the willingness of New Englanders going West either to join the Presbyterians, with whom they were substantially agreed in doctrine, or to combine with them in a mixed scheme of policy in which the Presbyterian element was uppermost. It was not until about 1850 that American Congregationalists began to draw more closely together, and to propagate in the Western States and Territories their own distinctive policy. They have since established not a few colleges and a number of well-organized theological seminaries, which have exerted much power in building up their communion. Meanwhile, without giving up the main principle of the autonomy of the local church, they have developed in various ways an active disposition to co-operate as a united religious body. This is seen in the organization of strong voluntary societies for the promotion of education and the increase of the ministry, and for the prosecution of missions. To these organizations a great deal of money is annually contributed. Their public services bring together large assemblies, which meet from year to year in different cities, often widely remote from each other. This tendency to denominational union is specially manifest in the institution of the National Council, which convenes at intervals of three years, and is composed of ministers and lay delegates, representing the churches. The Council, like minor councils which it is the old custom to call together to consider matters of local concern, is each time dissolved at its adjournment. It is possessed of no authority. Its function is to deliberate on subjects of common concern to the entire denomination, and to publish such opinions and counsels as a majority may see fit to send forth to the churches. The first of the National Councils (1865) issued a brief statement of doctrine, descriptive of the religious tenets generally accepted by the denomination. Later (1883) a large committee, previously appointed, framed a more full Confession of Faith, with the same end in view. Of course neither of these creeds was in the least binding upon ministers or upon churches, except so far as in each instance they might be adopted. The movement in the direction of union has been still further promoted by the two International Councils referred to above, in which the American Congregationalists have met the representatives of their brethren in Great Britain and its Colonies having the same faith and polity. In the different States, Conferences, composed likewise of representatives of the several churches and their pastors, have sprung up. These meet at stated intervals for the consideration of practical subjects of moment, and for the promotion of a religious spirit. There is a tendency, moreover, to accord to the Conferences the function of determining the tests of ministerial standing in the Congregational denomination. In some of the States the licensing of preachers, which was formerly left to the voluntary associations of ministers in the different localities, has been made a function of the State Conferences. At the very first, in New England, the theory was held that a minister, on ceasing to be the pastor of a particular church, falls into the rank of laymen. But the view was very soon adopted, and since has universally prevailed, that a minister in such cases still retains his clerical character. In later times the measure of authority conceded to a pastor as the shepherd of a flock has been much diminished in consequence of the gradual development of democratic feeling in both minister and congregation. This loss of clerical prestige has been in no small degree promoted by the increasing habit of dispensing with a form of installation, and of substituting for a permanent pastorate, instituted with the advice and consent of a council, an engagement to serve as a minister for a fixed term of one or more years. Under this custom of "stated supplies" ordination may be granted to those whose ministry in a particular church is made and dissolved by no other process than a mutual agreement. The Congregational churches, as distinct from the churches retaining the same polity, but separated by the adoption of Unitarian opinions, have in times past professed to be Calvinists of stricter or more moderate types. But as early as 1865, Arminians were welcomed to Congregational fellowship. In the last few decades, with the spread in the community of innovations in doctrinal and critical opinions, a wider diversity of belief has come to prevail, so that "Evangelical," in the popular sense of the term, rather than "Calvinistic," is the epithet more suitable to apply to the American Congregational preachers and churches. The *Year-Book* for 1900 reported the total number of communicants in all the States at 629,874, the number of Sunday-school scholars as 682,907, the total number of ministers as 5604, the amount of benevolent contributions by the churches as $2,110,413. Within the denomination are seven theological seminaries for the training of preachers.

***United States.***

The *Congregational Year-Book* for 1901 gave the following figures for Great Britain, Ireland, and the Channel Islands:—churches, branch churches, chapels, and mission stations, 4843; church members, 431,517; scholars, 693,347; ministers, 3123; evangelists

and lay pastors, 227; lay preachers, 5185. In comparing these figures with those for the preceding year, which are given in the body of this article, it must be borne in mind that in 1901 "99 churches in England and Wales have not made returns, and are not included in this summary," whereas in 1900 no less than 417 churches, including mission stations, were omitted; so that the figures for 1901 mark, if anything, a slight decline. The bulk of the foreign mission work of the British Congregationalists is done through the agency of the London Missionary Society. This society, although originally founded on an unsectarian basis by members of various denominations (including Churchmen), has become more and more closely connected with the Congregationalists, as other bodies came to have denominational societies of their own. In fact, at the present day the L.M.S. is "mainly dependent both for its missionaries and for its funds upon Congregationalists"; and a special responsibility for the society was formally recognized by the Congregational Union at the meeting held at Hull in the autumn of 1889. (G. P. F.)

**Congreve, Richard** (1818–1899), English Positivist, was born at Leamington, 4th September 1818, and was educated at Rugby under Dr Arnold, who is said to have expressed a higher opinion of him than of any other pupil. After taking first-class honours at Oxford and gaining a fellowship at Wadham, he spent some time as a master at Rugby, but returned to Oxford as a tutor, and there published a small work on the history of the Roman Empire of the West, and an annotated edition of Aristotle's Politics. About 1857 the attachment which he had conceived to the Positivist philosophy of Comte induced him to resign his fellowship, and the remainder of his life was devoted to the propagation of the Positive Philosophy. Unlike Mr Frederic Harrison, Professor Beesly, and Dr Bridges, he accepted Comte's teaching in its totality,—the worship and ritual, and the general philosophy,—and a split in the ranks of English Positivism was the result, Mr Harrison and his school setting up at Newton Hall on more independent lines than those of the complete surrender to Comte which Congreve inculcated. He translated several of Comte's works, and in 1874 published a large volume of essays, in which Comte's views as to the duty of Great Britain towards her foreign possessions, which usually consisted in renouncing them, were advocated with solemn earnestness, but without carrying conviction. In private life Mr Congreve was the most amiable and urbane of men. He died at Hampstead on the 5th of July 1899.

**Conjeeveram,** or **Kanchipur,** a town of British India, in the Chingleput district of Madras, 46 miles south-west of Madras by rail. Population (1881), 37,275; (1891), 42,548; (1901), 46,140, showing an increase of 8 per cent. The municipal income in 1897–98 was Rs.48,000. It has two high schools, two printing-presses, and several literary institutions.

**Conjuring.** See Magic.

**Conkling, Roscoe** (1829-1888), American senator and lawyer, was born in Albany, N.Y., on the 30th of October 1829. He was admitted to the Bar in 1850, and in 1858 was elected as a republican representative in Congress. Except during the years 1863 and 1864 he remained in the House until 1867, when he was chosen for the Senate. His abilities, aggressive leadership, and a haughty bearing always attracted much attention. In the republican national convention of 1876 he was a candidate for nomination for the Presidency. In 1881 he resigned his senatorship and sought re-election by the state legislature as a personal vindication, because President Garfield, without consulting him, had appointed a political opponent as collector of the port of New York. Being unsuccessful, he took up the practice of law in New York City, and appeared in some very important cases. He died in New York City, 18th April 1888.

**Connaught, H.R.H. Arthur William Patrick Albert,** Duke of, (1850– ——), third son and seventh child of Queen Victoria, was born at Buckingham Palace on 1st May 1850. Being destined for the army, the young prince was entered at the Royal Military College, Woolwich, in 1866. He received his commission on the 19th June 1868, being gazetted to the Royal Engineers. In the following November he was transferred to the Royal Artillery, and on the 3rd August 1869 to the Rifle Brigade. He got his company in 1871, and changed to the 7th Hussars in 1874; was promoted major in 1875, and returned to the Rifle Brigade as lieutenant-colonel in September 1876. He was promoted colonel and major-general in 1880, lieutenant-general in 1889, and general in 1893. He accompanied the expeditionary force to Egypt in 1882, and commanded the Brigade of Guards at the battle of Tel-el-Kebir (medal and clasp); he was mentioned three times in despatches, received the C.B., and was thanked by Parliament. In 1886 the duke went to India and commanded the Bombay army until 1890, when he returned home and was appointed to the command of the Southern District from 1890 to 1893, and to that of Aldershot from 1893 to 1898. On the departure of Lord Roberts for South Africa, the duke succeeded him as Commander-in-Chief of the forces in Ireland, 9th January 1900; and in 1901 was given the command of the Third Army Corps. On attaining his majority in 1871, an annuity of £15,000 was granted to Prince Arthur by Parliament, and in 1874 he was created Duke of Connaught and Strathearn and Earl of Sussex. On 13th March 1879 he married H.R.H. Princess Louise Marguerite of Prussia, third daughter of Prince Frederick Charles, and received an additional annuity of £10,000. The marriage at Windsor Castle was the most magnificent that had taken place there since the wedding of the Princess Royal in 1858. The Duke and Duchess represented Queen Victoria at the coronation of the Czar Nicholas II. at Moscow, in May 1896, when eight-and-twenty foreign princes were present.

**Conneaut,** a village of Ashtabula county, Ohio, U.S.A., on the shore of Lake Erie, on three railways. It has a good harbour and is a shipping-point of some importance. It was the first settlement in the Western Reserve. Population (1890), 3241; (1900), 7133.

**Connecticut.**—One of the New England States of the American Union, with a land area (according to the Census Bulletin) of 4845 square miles, or of 5004 according to the official survey of 1893. The highest land is the summit of Bear Mount in Salisbury, Litchfield county, 2355 feet above the mean high tide point at the sea. The highest elevation reached by any railway in the State is 1335 feet, about two miles east of Norfolk. According to the official survey (1893), 38½ per cent. of the State was in woodland. Population (1870), 537,454; (1880), 622,700; (1890), 746,258; (1900), 908,420. Of the total population in 1900, 454,294 were males and 454,126 females; 238,210 were foreign-born and 15,996 coloured (including 15,226 negroes, 599 Chinese, 18 Japanese, and 153 Indians). Out of 280,340 adult males 18,984 were illiterate; 16,696 of these being foreign-born. The death-rate in 1900 was 17 per thousand; (1890), 18·6. The average number of persons to the square mile in 1900 was 187·4. The State contains 24 incorporated cities or boroughs, with a population of over 5000 and with an aggregate population of 532,123. These figures show that 58·58 per cent. of the total population was urban. There were 5 cities with a population of 25,000 or over, namely, New Haven, Hartford, Bridgeport, Waterbury, and New Britain.

The General Assembly (Senate and House) is elected

biennially by a plurality vote, and meets at Hartford. There are 24 Senators and 255 members of the Lower House, making 279 in all: 87 towns have 2 members of the House each, and 81 have 1 each. This difference in membership is of historic origin, depending on the establishment of the town, except that every town which the decennial census shows to have 5000 inhabitants is entitled to 2 members. With the shifting of population, many old towns with two members each are now smaller than younger towns, allowed only one each. The result has been a demand from the larger towns for more representation. On the other hand, it has been contended that the town is the political unit under the Connecticut scheme of government, that one body is designed to be popular and the other representative, and that the two Houses of the National Congress, agreed upon in the Constitutional Convention of 1787 under the "Connecticut Compromise," illustrate the same scheme with the titles reversed. Several constitutional amendments have accordingly been proposed, including one for the plurality election of State officers. To elect these a clear majority of the votes cast was, in 1901, still required. Otherwise the General Assembly selects one from the two highest candidates for each position. Woman suffrage is permitted in school matters, but very few women vote. Local option prevails as to liquor-selling, and in 1899 there were 79 licence and 89 no-licence towns. The executive officers of the State, chosen biennially, are governor, lieutenant-governor, secretary, treasurer, comptroller. There is also an attorney-general, elected once in four years. This office was established in 1898. State supervision is very general; 21 State boards and commissions having offices in the State House. In 1883 a State board of pardons was established; up to that time pardons had been granted by the General Assembly.

*Finance.*—The funded debt in 1901 was $2,131,100, of which $495,000 was at 3½ per cent. and $1,636,300 at 3 per cent. From this should be deducted the cash in hand, usually from $500,000 to $750,000. Except for the military commutation tax of $2 per caput on male citizens between 21 and 45 years of age, the revenue of the State since 1890 has been collected by indirect taxation and almost entirely from corporations. The receipts for the year ending September 30, 1899, were $2,749,273, which, however, included the income of various funds. The direct tax laid upon the towns was suspended in 1891. A rapid increase followed in State expenditures, from $1,757,512 in 1891 to $2,550,080 in 1897—an increase of 50 per cent., while the income increased only about 30 per cent. In 1898 and 1899, however, the income exceeded the receipts by ample margins. While there is no direct State tax, citizens are taxed locally by the county, the town, the city, or the borough, and the school district. Many of the tax laws are antiquated, and the need of general revision has long been urged.

*Roads.*—In 1895 a "good roads movement" began, under which in the first six years the State expended about $700,000, contingent upon contributions of about $500,000 from town and county treasuries. When the work began the highway commission reported 5558 miles of main roads and 8530 of side roads in the State—total, 14,088 miles. About 250 miles were improved between 1895 and 1901.

*Railways.*—There are 1013·35 miles of steam railway. Of these all but the New London Northern, from New London to Brattleboro, Vt. (56·1 miles in Connecticut); the Central New England, from Hartford to the Hudson (67·25 miles in Connecticut); and the South Manchester, from South Manchester to Manchester (2·25 miles), are included in the system of the New York, New Haven, and Hartford Railroad Company, which controls 2047·19 miles, of which 887·75 are in Connecticut. It controls all the rail routes between New York and Boston, and the entire Old Colony system in Massachusetts, and also practically all the steamboat lines on Long Island Sound. Between New Haven and New Rochelle, N.Y., where the line divides, the company has four tracks. The company has an authorized capital of $100,000,000, of which in 1899 about $55,000,000 had been issued. It had then 8654 stockholders, of whom 2620, holding $16,036,500 of the stock, were residents of Connecticut. The majority of its board of directors must be citizens of Connecticut. It reported 28,211 employees in 1899. In that year the railways of the State carried 50,269,468 passengers and 15,891,642 tons of freight. Efforts have been made for several years to abolish grade crossings of rail and waggon roads, but in 1899 there still remained 988 of these death-traps.

*Other Means of Communication.*—The first successful trolley road was established in Connecticut in 1885. In 1899 there were 31 companies working 462·92 miles of trolley, not counting sidings, and these roads carried that year 59,084,702 passengers. Their capital stock aggregated $12,715,948, and their bonded debt $10,608,800. They had 2465 employees. During 1899 the trolley roads injured 324 persons, and the steam roads 327. The trolley has brought wide outlying rural districts into close touch with the cities, and has connected centres of population, so as to make them practically one community. The store, the church, the theatre, and the farm have all received a new impulse from the movement. Besides the trolley, a "third rail" electric system is being developed in Connecticut. The New York, New Haven, and Hartford Railway, at a power-house at Berlin, produces electricity, which is carried on a central rail between the rails of the road bed of one of its regular tracks. The power is taken up by a shoe that travels along the third or middle rail, and heavy cars on the solid road bed can make very fast time. The third rail operates between New Britain and Berlin, 3 miles, and between Hartford and Bristol, through New Britain, 17 miles. Electric lighting is very general, and in many instances water-power is utilized for this purpose.

*Manufactures.*—The great demand for copper wire and for other parts of electric outfit has given an immense impetus to the copper and brass mills, which are the largest consumers of copper in the world, and are situated chiefly in the Naugatuck Valley in Waterbury, Torrington, and Ansonia. The State holds a leading place in the production of silk, woollen, and cotton goods, fire-arms and ammunition, edge tools, hardware, needles, bicycles, motor-carriages, rubber goods, thread, sewing machines, clocks, hats, silverware, knit goods, &c. Connecticut maintains its reputation for inventions, and for the skill of its mechanics. In 1900 the number of manufacturing establishments in the State (excluding 977 having a product of less than $500 each, but including 4630 classified as hand-trades) was 9128, with a total capital (including land, buildings, machinery, &c., but not capital stock) of $314,696,736. There were 9981 salaried employees receiving salaries amounting to $12,286,050; an average number of 176,694 wage-earners, receiving total wages of $82,767,725; and 9381 proprietors and firm members. The cost of materials (including mill supplies, freight, fuel, &c.) was $185,641,219. The added values of the products in the different establishments amounted to $352,824,106. If from this gross value be deducted, in order to avoid duplication, the value ($144,809,525) of materials purchased in a partly manufactured form—where the finished product of one industry is used later as the raw material for another, the total net value of the products is found to be $208,014,581. The most important industries and the value of their products were: textile manufactures, $49,265,752; brass manufactures (including rolled brass and copper), $48,526,868; foundry and machine shops products, $18,991,079; hardware, $16,301,198; plated and britannia ware, $9,538,397.

*Banks.*—There were, in 1899, 88 mutual savings banks, with deposits of $174,135,195 belonging to 393,137 depositors. Of these depositors 341,362 had each less than $1000 on deposit, whose total deposits amounted to $68,420,853. These banks do much to encourage thrift. They pay as a rule 4 per cent. interest on the deposits. In June 1900 there were 81 national banks in the State; capital, $20,747,070; surplus and undivided profits, about $11,000,000; deposits, $42,700,000. There were also 8 State banks; capital, $2,240,000; surplus, &c., $864,000; deposits, $6,726,563; and thirteen trust companies; capital, $1,317,800; surplus, $880,000, deposits, $7,420,608. The total deposits of all the banking interests were thus $230,982,366.

*Insurance.*—The 8 stock fire insurance companies had in 1900 $10,250,000 of capital, $13,895,791 of net surplus, and $41,956,826 of assets, and insured about $2,700,000,000 of property. Besides these were 17 mutual companies with $2,000,000 of assets and $111,500,000 of risks. The fire losses paid by Connecticut companies in 1899 were $12,417,000. In life insurance, 6 companies with assets of $156,972,000, including $15,656,721 of surplus, were in 1900 insuring 356,661 persons for a total of $507,245,300. The assets of the fire and life companies of the State together exceed $200,000,000. It was in Connecticut that accident insurance was first undertaken in the United States. The deposits of the banks and the assets of the life and fire insurance companies aggregate nearly $475,000,000.

*Education.*—Almost every town grew up around a church, and every town has also its school. Education has been an object of concern from the founding of the colony, and the State ranks among the first in this respect. Yale University, at New Haven, founded in 1701, has a total of 2542 students and a faculty of 271. Trinity College at Hartford, founded in 1823, reported for 1900, 137 students and 24 instructors. Wesleyan University at Middletown, founded in 1829, had 339 students and a faculty of 26. Common school education is compulsory between the ages of

7 and 16. In 1899 there were 1546 public schools, 76 high schools, 77 kindergartens, and 19 evening schools; also 177 private schools, with 30,083 registered scholars. The State furnishes $200 to establish, and up to $100 a year to maintain, a free public library in any town that will contribute an equal sum. In 1899, 6 years after the passage of the law, 51 towns had established free libraries under its provision, and there were 40 others, making 91 free public libraries in the State, with 566,706 volumes and a yearly circulation of 1,609,788 volumes. There were also 43 "travelling libraries," which move from one town to another, the gifts of individuals or associations. (C. H. CL.)

**Connellsville,** a borough of Fayette county, Pennsylvania, U.S.A., situated in the south-western part of the state, on Youghiogheny river and on branches of the Pennsylvania and the Baltimore and Ohio Railways, at an altitude of 915 feet. It is the centre of the well-known Connellsville coking coal region, in which most of the coking coal used in iron-smelting in the United States is produced. Out of 47,142 coking ovens in the United States in 1899, 19,294 are in this district; while of the total amount of coke produced in the Union (19,640,798 tons), not less than 10,389,335 tons were made in this district. Population (1880), 3609; (1890), 5629; (1900), 7160.

**Connersville,** capital of Fayette county, Indiana, U.S.A., situated on Whitewater river, in the eastern part of the state, at an altitude of 828 feet. It is at the intersection of the Cincinnati, Hamilton, and Dayton, the Cleveland, Cincinnati, Chicago, and St Louis, and the Fort Wayne, Cincinnati, and Louisville Railways. Population (1880), 3228; (1890), 4548; (1900), 6836.

**Conscience, Hendrik** (1812–1883), the most eminent of modern Flemish writers, was born at Antwerp on the 3rd of December 1812. Although he invariably signed his name Hendrik, his baptismal name was Henri. He was the son of a Frenchman, Pierre Conscience, from Besançon, who had been *chef de timonerie* in the navy of Napoleon, and who was appointed under-harbourmaster at Antwerp in 1811, when that city formed part of France. Hendrik's mother was a Fleming, Cornelia Balieu. When, in 1815, the French abandoned Antwerp after the Congress of Vienna, they left Pierre Conscience behind them. He was a very eccentric person, and he took up the business of buying and breaking-up worn-out vessels, of which the port of Antwerp was full after the peace. The child grew up in an old shop stocked with marine stores, to which the father afterwards added a collection of unsaleable books; among them were old romances which inflamed the fancy of the child. His mother died in 1820, and the boy and his younger brother had no other companion than their grim and somewhat sinister father. In 1826 Pierre Conscience married again, this time a widow much younger than himself, Anna Catherina Bogaerts. Hendrik had long before this developed an insatiable passion for reading, and revelled all day long among the ancient, torn, and dusty tomes which passed through the garret of "The Green Corner" on their way to destruction. Soon after his second marriage Pierre took a violent dislike to the town, sold the shop, and retired to that Kempen or Campine which Hendrik Conscience so often describes in his books—the desolate flat land that stretches between Antwerp and Venloo. Here Pierre bought a little farm, with a great garden round it, and here, while their father was buying ships in distant havens, the boys would spend weeks, and even months, with no companion but their stepmother. At the age of seventeen Hendrik left the paternal house in Kempen to become a tutor in Antwerp, and to prosecute his studies, which were soon broken in upon by the revolution of 1830. He volunteered as a private in the new Belgian army, and served in barracks at Venloo, and afterwards at Dendermonde, until 1837, when he retired with the grade of sergeant-major. Thrown in this way with Flemings of every class, and made a close observer of their mental habits, the young man formed the idea of writing in the despised idiom of the country, an idiom which was then considered too vulgar to be spoken, and much less written in, by educated Belgians. Although, close by, across the Scheldt, the Dutch possessed a rich and honoured literature, many centuries old, written in a language scarcely to be distinguished from Flemish, a foolish prejudice denied recognition to the language of the Flemish provinces of Belgium. As a matter of fact, nothing had been written in it for many years, when the separation in 1831 served to make the chasm between the nations and the languages one which could never be bridged over. It was therefore with the foresight of a prophet that Conscience wrote, in 1830 itself, "I do not know how it is, but I confess I find in the real Flemish something indescribably romantic, mysterious, profound, energetic, even savage. If I ever gain the power to write, I shall throw myself head over ears into Flemish composition." His poems, however, written while he was a soldier, were all in French. He received no pension when he was discharged, and going back idle to his father's house, he determined to do the impossible, and write a Flemish book for sale. A passage in Guicciardini fired his fancy, and straightway he wrote off that series of scenes in the war of Dutch Independence which lives in Belgian literature under the title of *In't Wonderjaar 1566*; this was published in Ghent in 1837. His father thought it so vulgar of his son to write a book in Flemish that he turned him out of doors, and the celebrated novelist of the future started for Antwerp, with a fortune which was strictly confined to two francs and a bundle of clothes. An old schoolfellow found him in the street and took him to his home; and soon various people of position, amongst them the eminent painter, Wappers, interested themselves in the brilliant and unfortunate young man. Wappers even gave him a suit of clothes, and presented him to the King, who expressed a wish, which was not immediately carried out in consequence of some red tape, that the *Wonderjaar* should be added to the library of every Belgian school. But it was under the patronage of Leopold I. that Conscience published his second work, *Fantasy*, in the same year, 1837. A small appointment in the Provincial Archives relieved him from the actual pressure of want, and in 1838 he made his first great success with the historical romance called *The Lion of Flanders*, which still holds its place as one of his masterpieces. To this followed *How to become a Painter*, 1843; *What a Mother can Suffer*, 1843; *Siska van Roosemael*, 1844; *Lambrecht Hensmans*, 1847; *Jacob van Artevelde*, 1849; and *The Conscript*, 1850. During these years he lived a variegated existence, for some thirteen months actually as an under-gardener in a country house, but finally as Secretary to the Academy of Fine Arts in Antwerp. It was long before the sale of his books, greatly praised but seldom bought, made him in any degree independent. His ideas, however, began to be generally accepted. At a Flemish Congress which met at Ghent so early as 1841, the writings of Conscience were mentioned as the seed which was most likely to yield a crop of national literature. Accordingly the patriotic party undertook to encourage their circulation, and each fresh contribution from the pen of Conscience was welcomed as an honour to Belgium. In 1845 Conscience was made a Knight of the Order of Leopold. To write in Flemish had now ceased to be regarded as a proof of vulgarity; on the contrary, the tongue of the common people became almost fashionable. The poet K. L. Ledeganck (1805–1849), who celebrated the "Three Sister-Cities" of Ghent, Bruges, and Antwerp, was the

first to follow in the steps of Conscience. Another national writer who, though much older than the novelist, became his eager disciple, was J. F. Willems (1793–1846), and Flemish literature began to live. In 1845 Conscience published a *History of Belgium*, but he was well advised to return to those exquisite pictures of Flemish home-life which must always form the most valuable portion of his repertory. He was now at the height of his genius, and *Blind Rosa*, 1850; *Rikketikketak*, 1851; *The Decayed Gentleman*, 1851; and *The Miser*, 1853, rank among the most important of the long list of his novels. These had an instant effect upon contemporary fiction, and Conscience had many imitators. Nevertheless, not one of the latter has approached Conscience in popularity, or has deserved to approach him. In 1855 the earliest translations of his tales began to appear in English, French, German, and Italian, and his fame became universal. In 1867 the post of Keeper of the Royal Belgian Museums was created, and this important sinecure was given to Conscience. He continued to produce novels with great regularity, and his separate publications amounted at last to nearly eighty in number. He was now the most eminent of the citizens of Antwerp, and his seventieth birthday was celebrated by public festivities. After a long illness he died, in his house in Antwerp, on the 10th of September 1883; he was awarded a public funeral. The portraits of Conscience present to us a countenance rather French than Flemish in type, with long smooth hair, contemplative dark eyes under heavy brows, a pointed nose, and a humorous broad mouth; in late life he wore the ornament of a long white beard. Whether the historical romances of Conscience will retain the enormous popularity which they have enjoyed is much less than certain, but far more likely to live are the novels in which he undertook to be the genre-painter of the life of his own day. In spite of too rhetorical a use of soliloquizing, and of a key of sentiment often pitched too high for modern taste, the stories of Conscience are animated by a real spirit of genius, mildly lustrous, perhaps, rather than startlingly brilliant. Whatever glories may be in store for the literature of Flanders, Conscience is always sure of a distinguished place as its forerunner and its earliest classic. (E. G.)

**Consett,** a town and railway station in the north-western parliamentary division of Durham, England, 12 miles north-west of Durham city and 14 south-west of Newcastle. Besides the parish church there are Baptist, Wesleyan, and other chapels; also a town-hall. There are extensive collieries in the district, and large ironworks. Area of urban district, 1024 acres. Population (1891), 8460; (1901), 9694.

**Conshohocken,** a borough of Montgomery county, Pennsylvania, U.S.A., situated in 40° 04′ N. lat. and 75° 18′ W. long., on the north bank of Schuylkill river, 13 miles north-west of Philadelphia, in the south-east part of the state. It is entered by the Pennsylvania and the Philadelphia and Reading Railways. Population (1880), 4561; (1890), 5470; (1900), 5762.

**Constance,** a city in the grand duchy of Baden, on the south bank of the Rhine at its exit from the Lake of Constance, and 30 miles from Schaffhausen by rail. It stands at a height of 1316 feet above the level of the sea. The Vincent collection of painted glass in the chapter-house has now been sold. The Dominican convent has been converted into a hotel; in its tower John Hus was confined for three months, before he was burnt on 6th July 1415 on a field in the suburb of Brühl. In the market-place are two historical houses—one wherein Barbarossa signed the peace of Constance with the Lombard cities in 1183, and the other in which Frederick of Hohenzollern was in 1417 invested with the March of Brandenburg. The population of Constance was 21,363 in 1901.

**Constance, Lake of,** or the "Swabian Sea," on the north-east frontier of Switzerland. According to the latest measurements, its area is 207 square miles (of which $81\frac{1}{4}$ square miles belonged to Switzerland, viz., $59\frac{3}{4}$ square miles to Canton Thurgau, and $21\frac{1}{2}$ square miles to Canton St Gall), its height above the sea-level 1309 feet, its greatest length 40 miles, its greatest depth 1014 feet, and its greatest width $7\frac{1}{2}$ miles.

**Constant, Benjamin** (1845–1902), French painter. See Schools of Painting (*France*).

**Constanța** (or Kustendji), a town and seaport of Rumania on the Black Sea, 140 miles by rail from Bucharest. The bridge at Cernavoda across the river Danube was opened by the king in 1896. A line of fast passenger steamers, owned by the Rumanian Government, in connexion with the Orient express and Ostend express, conveys passengers and mails to Constantinople. The town has greatly developed of late years, owing to its improved communications by land and sea, and is now much used as a summer bathing resort. The streets are clean and well kept. Constanța is on the site of the ancient Tomi, where Ovid lived and died in exile. There is a statue erected to his memory in the chief square of the town. Population (1895), 10,607; (1900), 12,725, about one-half of whom are of the Orthodox faith, and the remainder pretty equally divided between Roman Catholics, Moslems, Armenians, and Jews.

**Constantina,** a town and railway station of Spain, in the north of the province of Seville. Population in 1897, 9983. The neighbourhood is chiefly agricultural, with some mines, lead and iron, in the sierra not far off. The local industries are those connected with cork, wood, alcohol, and tanneries, and the market days every week are very animated. It is one of the most important towns of the province, though its public buildings offer nothing worthy of notice.

**Constantine,** capital of the department of the same name in the east of Algeria, picturesquely perched, 2130 feet above the sea, on a rock rising perpendicularly nearly 1000 feet from the bed of the Rummel, which surrounds it on the north and the east, while on the west the city is connected by an isthmus with the mainland. It is 54 miles by rail south by west of Philippeville, its seaport, and has railway connexion also with Algiers, Bona, Tunis, and Biskra. Important strategically, Constantine by its beauty of situation annually attracts crowds of visitors. There are no important buildings of recent erection. Railways have taken away from the city its monopoly of the traffic in wheat, though its share in that trade still amounts to from 10 to 12 million francs (£400,000–£480,000) a year. Its industry also is considerable, its peltry business employing 1000 persons and supplying the wants of 2 millions. It also manufactures woollen stuffs. There is a project to surround the city with capacious reservoirs, such as would transform the face of the country. The population in 1891 was 46,580, and in 1900 it was 51,997, of whom 18,387 were French. The indigenous element, numbering 28,000, grows faster than the colonial.

**Constantinople,** the capital of the Turkish Empire, situated on the strait between the Black Sea and the Sea of Marmora. The last quarter of the 19th

century wrought little change in the outward aspect of the city, but throughout that period, during the reign of Sultan Abdul Hamid II., many of the conditions of life in the Turkish capital underwent considerable alteration. This arises from the fact that Sultan Abdul Hamid's mode of life and method of government were wholly different from those of his predecessors. Constantly preoccupied with apprehension for his personal security, he transferred his abode, shortly after coming to the throne, from the palace of Dolma Baghtché, on the bank of the Golden Horn, where he did not feel safe, to Yildiz Kiosk, a pleasure resort of his predecessors on a hill behind Beshiktash, overlooking Pera, Stamboul, the lower Bosphorus, and the Sea of Marmora. The park is surrounded by a great wall, in some parts 50 feet high, and contains two small lakes, the one natural and the other artificial. Early in 1901 the Sultan, in order to extend the park towards Ortakeui, bought a large adjacent estate, consisting of a mansion and extensive grounds, which are now enclosed within the mural fence of Yildiz. Within this carefully guarded enclosure are numerous buildings, which include an observatory, baths, a museum of arms, a porcelain factory, a furniture manufactory, armouries, stabling for 150 horses, and a harness factory, besides a number of châlets and other fanciful edifices. The most conspicuous amongst these latter is the Merassim Kiosk, built specially for the occupation of the German Emperor on his first visit in 1889, and enlarged for his later visit in 1898. Some of the smaller châlets are used as prisons for political prisoners, or as houses of detention for persons undergoing

B. V. Darbishire & O. J. R. Howarth. Oxford, 1901.

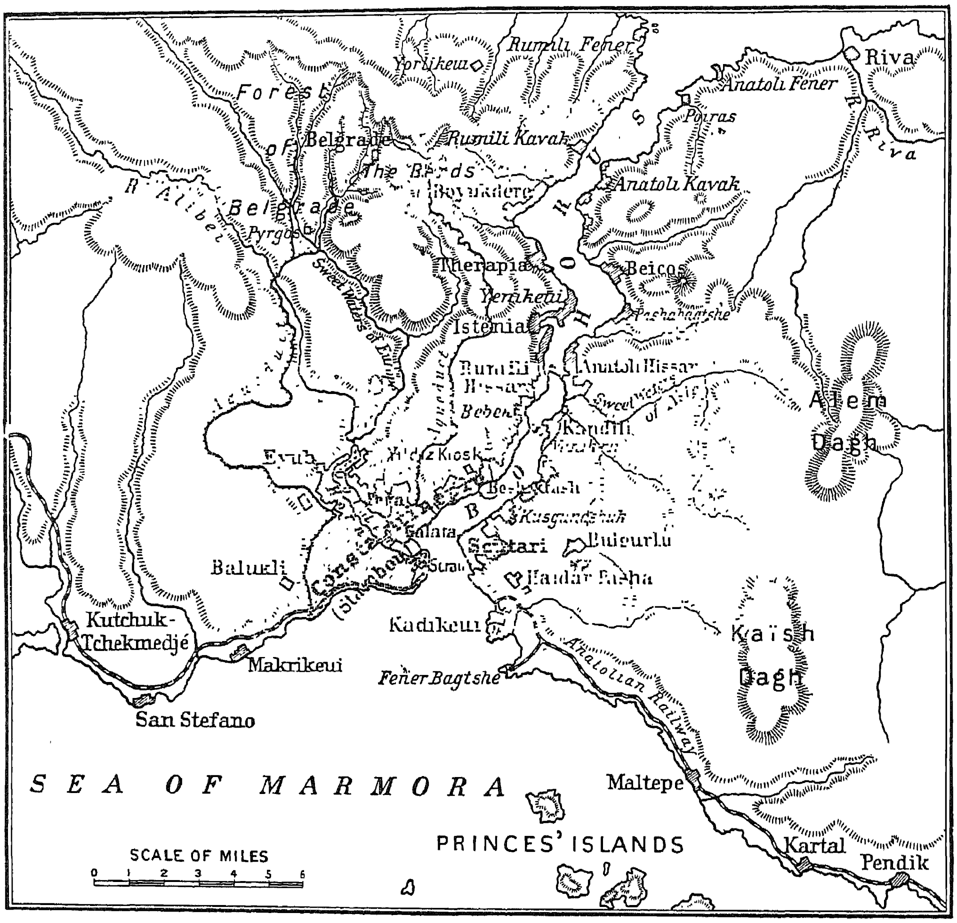
PLAN OF ANCIENT AND MODERN CONSTANTINOPLE.

inquisitorial treatment. Within the main enclosure, a second wall surrounds the kiosk which the Sultan, with his four principal wives, inhabits, and which he himself designed. About it are grouped smaller kiosks in which the other ladies of the harem reside. The doors of this inner barrier are all locked at sunset, and therein, protected by his bodyguard, the Sultan passes his nights in assured security. In March 1901 the Offices of the Privy Purse, from the windows of which—commanding a view of the road between the palace gateway and the Hamidieh Mosque—approved visitors witnessed the Selamlik procession on Fridays, were demolished by Imperial order, called forth by the Sultan's ever-increasing fear of assassination. The palace domain is guarded by two batteries of artillery, and by the whole of the 2nd division of the First Army Corps, composed of 12 battalions, each 600 strong. These are lodged in spacious barracks built on the outer side of the park wall, with a mosque adjacent thereto for the special use of the troops. The Sultan's guard consists of (1) the "Tufenkdjis," or bodyguard, of whom there are 94, Albanians and Circassians; (2) the "Silahsors," drilled soldiers, numbering about 300, Albanians and Bosniaks; (3) the "Hademés" (*garde de luxe*), employed only on State occasions, and comprising the musicians of the Palace, about 500 in number; (4) the "Tchaush," of whom there are between 50 and 60, and who are messengers as well as guards; (5) the Bekdjis or watchmen, numbering 200, who keep watch by relays all over the park by day and night.

The most important of the material changes since 1880

is the construction of the quays on each side of the Golden Horn. Begun in 1891 by a French company with a capital of nearly a million sterling, the quay was completed in 1899 on the Galata side to its full length of 756 metres, with a breadth of 20 metres; and the portion on the Stamboul side, of which the total length is 378 metres, was finished and opened in 1900. The appearance of the port is much improved by the demolition of the dilapidated structures which previously bordered either shore, and which are replaced by substantial buildings. Tramways have also conduced to the embellishment of the city, for—besides causing improvement in the streets they traverse—they have promoted much new building in salubrious localities, commanding fine prospects, which were previously out of reach. On both sides of the line, extending north-west of Pera, a large number of detached houses with gardens have been built, forming a new and extensive faubourg, which on one side reaches out in the direction of Eyub and the Sweet Waters of Europe, and on the other along the heights overlooking the lower Bosphorus and the Marmora. Excepting the streets traversed by the tramways, a few of those in which the departments of State are situated, and some of the suburban roads, the other highways and byways remain unimproved, wearing the old ragged pavement, destitute of footways, and flanked by buildings, mostly wooden, of mean design and more or less decayed.

The ravages of the great fire of 1870, which consumed 5000 buildings in Pera, have been almost, though not yet completely, made good. In the renovated quarters stone



SKETCH MAP OF THE ENVIRONS OF CONSTANTINOPLE.

buildings mostly replace the wooden structures which the conflagration swept away. All the dwelling-houses are stone-built, and of late the fashion has set in of building large and lofty blocks divided into suites of apartments. This tendency to erect costly and substantial buildings has been promoted by the increased facilities for insuring against fire. Year by year new insurance agencies have been established, and by 1900 no less than forty-three companies (about half of them British) were represented in Constantinople. Some new public buildings in conspicuous positions fix the eye in viewing the city from the sea. Such are the Armoury at Matchka, on the heights of Nishan-Tash, above Dolma Baghtché; the Imperial Ottoman Bank, in Galata; the offices of the Public Debt, in Stamboul; and the School of Medicine, between Scutari and Haidar Pasha.

The appearance of the Bosphorus has greatly faded in recent years, owing to the large number of *yalis* and *konaks* which, through the dispersal of many old Turkish families, have been left empty and become dilapidated. The new generation eschews the Bosphorus,—where the price of land is still nominally high, although there is no demand for it,—and has bought ground largely along the course of the Anatolian Railway, between the terminus at Haidar Pasha and the station of Pendik on the Marmora. This region, which is mild, picturesque, and well wooded and watered, with a very productive soil, is now overspread with newly-built houses of the better sort in more or less spacious gardens, all occupied by the Turks who built them. Since 1855, when Constantinople was much shaken and somewhat damaged by the earthquake which destroyed Brusa, the Turkish capital had not ex-

perienced any severe seismic convulsion until July 10, 1894. On that day there was a violent shock lasting nearly twenty seconds. The damage wrought by it was chiefly in the quarters lying between the Mosque of Sultan Ahmed and the Adrianople Gate. All the damage has been repaired, and the ruined part of the grand Bazaar has been rebuilt on a much better plan.

*Trade.*—The diminution of the trade of Constantinople caused by the territorial changes prescribed by the Congress of Berlin was heavily supplemented by that produced by the annexation of Eastern Rumelia to Bulgaria in 1885, as that province drew all its supplies of foreign merchandise from the capital from which a customs frontier now divides it. Of recent years, moreover, mainly owing to governmental interference with the passenger traffic between the capital and the Asiatic provinces, a large proportion of the provincial dealers now import for themselves by Ismid, Trebizond, Samsun, or Kerasund, instead of buying their supplies in Constantinople. About forty per cent. of the import trade of Constantinople is British; France, Germany, Austria, Belgium, and Italy share the balance, in proportions following the order in which they are mentioned. Constantinople produces nothing, and consequently exports nothing but waste products, but it receives much merchandise in transit. Latterly, however, a large proportion of it has been diverted—like the import trade, and for the same reasons—to the ports of the Black Sea and to Ismid, which latter as a shipping-port is much assisted in its competition with Constantinople by the Anatolian Railway. The transit trade of Constantinople included, until quite recent years, yellow-berries, gall-nuts, madder-roots, and other colouring matters; but these products have been superseded by the aniline dyes. In connexion with this decrease of trade it is noteworthy that several joint-stock banks have liquidated. Only the Imperial Ottoman Bank and a branch of the Crédit Lyonnais remain.

As far as can be ascertained, the average annual value of the goods passing through the port was, at the opening of the twentieth century, about £T11,000,000 (a Turkish lira = 18s.). It is, however, impossible to obtain exact figures, and it should be clearly understood that this is only an estimate, arrived at indirectly from a study of the custom receipts. The total given is made up as follows:—

| *Imports.* | £T | *Exports.* | £T |
|---|---|---|---|
| Manufactured goods—cotton, woollen, silk, &c. | 3,500,000 | Cereals | 1,000,000 |
| Haberdashery, iron-mongery | 700,000 | Mohair | 800,000 |
| Sugar | 500,000 | Carpets | 700,000 |
| Petroleum | 400,000 | Silk and cocoons | 500,000 |
| Flour | 400,000 | Opium | 400,000 |
| Coffee | 300,000 | Gum tragacanth | 150,000 |
| Rice | 250,000 | Wool | 100,000 |
| Cattle | 100,000 | Hides | 100,000 |
| Various | 850,000 | Various | 350,000 |
| Total | 7,000,000 | Total | 4,100,000 |

The shipping visiting the port, counting all seagoing craft (including liners) other than coasters, numbered 13,357 vessels of 11,453,332 tons in 1893, 14,387 vessels of 12,501,102 tons in 1896, and 10,777 vessels of 10,288,091 tons in 1900.

The minor industries in Constantinople, never very important, are declining, and foreign industrial undertakings have had little success.

*Education.*—In the department of Education the only important fact is that the Turkish School of Arts and Crafts has been rebuilt and reorganized. Otherwise the educational record of the years 1885 to 1900 is limited to the opening of a few schools of the more elementary sort. There are thirty-two foreign schools, one only of which is British. Two new charitable institutions, founded by the Sultan and supported by the Civil List, claim notice, namely, the Asylum for the Poor and the Hamidieh Hospital for Children. The Imperial Museum of Antiquities, opened in 1892, contains the celebrated Greek Sarcophagi, twenty-one in number, discovered at Saida, the ancient Sidon, in 1888.

*Local Government.*—Constantinople contains four districts or "divisions" (*Belad-i-Selessi*), namely, Stamboul, Pera-Galata, Beshiktash, and Scutari, of which the Government is in the hands of the Minister of Police, who is *ex officio* Governor of Stamboul. The other three districts have each their Governor (*mutessarif*), who is appointed by the Sultan, and is subordinate to the Minister of Police. All matters concerning public order and security are controlled by these four Governors, each of whom is provided with a separate staff of police and gendarmery, each district having its own police court, of which the Governor is the presiding magistrate. The municipal government of the four metropolitan divisions is vested in the Prefect of Stamboul, who is appointed by the Sultan He is the President of a Council of twenty-four members, who are appointed either by the Sultan, or by the Minister of the Interior in cases where there is no Palace candidate. The Prefecture has charge of all that concerns the streets, the markets, and the bazaars, including the street porters and the public weighers. It has also control over the public baths and the hospitals, of which latter there are three; and is charged with the collection of all city dues, including the *Verghi* (Property Tax). The Prefecture is divided into ten *cercles*, or wards, each of which has a president, vice-president, secretary, engineer, and physician, all of whom are appointed by the Council of the Prefecture. The Prefect is immediately subordinate to the Minister of the Interior. A military commandant, having under his orders a detachment of the garrison of Stamboul, is appointed to each of the four districts, the supreme military commander being the *Dersaadet Merkez Commandani—i.e., Commandant de la Place*—Commander of the Garrison of Constantinople.

The outlying parts of the city are divided into six districts (*Cazas*), namely, Princes' Islands, Guebzeh, Beicos, Kartal, Kutchuk-Tchekmedjé, and Shilé—each of which has its Governor (*kaimakam*), who is usually chosen by the Palace. These districts are dependencies of the Ministry of the Interior, and their municipal affairs are directed by agents of the Prefecture.

*Population.*—The city population, according to official estimate, numbers 880,000; the aggregate population of the six suburban districts is officially estimated at 320,000; giving a grand total of 1,200,000, which is the official estimate of the entire population of the city of Constantinople and its faubourgs. The Armenian element of the population was appreciably reduced by the events of 1895–96; but no trustworthy figures in connexion with this diminution are obtainable.

In the four central districts of the city the first-class thoroughfares and a considerable proportion of those of the second and third order are now fairly well lighted with gas.

*Water Supply.*—From the time of the conquest of Constantinople by the Turks up to the year 1882 one method of obtaining water for the city was followed to the exclusion of all others. This method was to trap the rain in the natural hollows of the forest of Belgrade (about 18 miles north-east of Constantinople), together with the water of the rivulets which trickle through some of them. It was effected by throwing a dam across the lowest end of each depression, thus stopping the outflow of water, and forming a reservoir called *Bend* in Turkish. There are nine of these "Bends." The water from the "Bends" is conveyed to its destination in earthenware pipes set in cement, and laid underground except in places where depressions of the soil necessitate an aqueduct. In several cases where that occurs the remains of the ancient aqueducts are utilized. The pipes convey the water to the public fountains, from which the poorer classes take it as they require, and it is distributed by the corporation of water-carriers (*sakka*) to those who can afford to pay the cost of delivery. This was the only water system of Constantinople up to the year 1885. The radical defects of this system suggested to Kiamil Bey, Grand Master of Ceremonies at the Court of the Sultan, in conjunction with a foreigner residing in Constantinople, to apply for a concession to bring water from Lake Derkos, which is about 28 miles west of the Black Sea mouth of the Bosphorus, and about 3 miles from the Black Sea shore. The application was finally granted in 1881 to the associate of Kiamil Bey, who had himself died in the meanwhile. A French company was formed, with a capital of twenty million francs, to carry out the undertaking; the works were begun in 1882, and on 1st July 1885 the new water supply was inaugurated. Lake Derkos has a total length of 8 miles, and a mean breadth of 2 miles. It is abundantly supplied by the river Karaman and its tributaries flowing down from the Strandja Dagh. The water, when taken from the lake, is first filtered, and then raised by a steam elevator (600 h.p.) to a height of 365 feet, where it enters the main conduit, 29 miles long, and is thence distributed by the delivery-pipes, of which the total length at the present time is 165 miles. The quality of the Derkos water is excellent, and the service is thoroughly well conducted. Until the year 1893 the Asiatic suburbs had no water supply but such as individual families obtained by cisterns, wells, &c. In 1888 a German firm obtained a concession for establishing water-works at the Sweet Waters of Asia—a lake lying between the villages of Kandili and Anatoli-Hissar, which is fed by mountain streams from the Kaïsh-Dagh and Alem-Dagh. A company called the *Compagnie des Eaux de Scutari-Kadikeui* was formed in 1890, with a share capital of £144,000 and a debenture capital of £160,000. The works were commenced in January 1891, and the supply service began in October 1893.

### *Archæology.*

Considerable attention has been devoted in recent years to the archæology of Constantinople, and although the study is seriously hampered by the impossibility of making excavations, a real advance has been made in this department of knowledge. Many mistakes have been corrected, important facts have been discovered, and problems remaining to be solved have been more clearly recognized and more precisely stated than heretofore. The city of Byzantium, out of which Constantinople sprang, and from which it inherited characteristic features, occupied, when it reached its greatest extent, most of the territory comprised by the two hills nearest the apex of the promontory and by the level ground at their base. The western wall of the city started from a point near the Stamboul Custom House and reached the ridge of the Second Hill, a short distance to the east of the column popularly named Tchemberli Tash and the Burnt Column. There stood the principal gateway of the city, opening upon the Egnatian Road. From that point the wall ran southwards for some distance towards the Sea of Marmora, and then turned eastwards until it reached that sea in the neighbourhood of the present Seraglio Lighthouse. The Acropolis was situated on the summit of the First Hill, where the courts of the Old Palace of the Sultans are found; and within the citadel stood, as was customary, the chief temples of the city—the Temples of Artemis, Aphrodite, Apollo, Zeus, Poseidon, and Demeter. The harbours of the city were upon the Golden Horn—one, the Portus Prosforianus, in the bay indenting the shore in front of the station of the Chemins de Fer Orientaux; the other, the Neorium, in the bay before the Stamboul Custom House. On the level tract behind the former was the Strategion, the Champs de Mars of the city; while another public square, known as the Tetrastoon, because surrounded by four porticos, is represented by the open space between S. Sophia and the Hippodrome. There stood the Baths of Zeuxippus. Two theatres were built against the steep eastern side of the Acropolis Hill, and a Stadium stood on the level ground at the foot of the Acropolis beside the Golden Horn. A large portion of the Hippodrome, so famous in the history of Constantinople, was constructed by Septimius Severus for the benefit of the citizens of Byzantium, when he rebuilt the city in A.D. 196. The graceful granite column which stands on the high ground near the apex of the promontory is a monument erected by Byzantium in honour of the victory of Claudius Gothicus over the Goths. It still bears most of the original inscription

REDUCI FORTUNÆ OB DEVICTOS GOTHOS.

According to the measurements given by Zosimus and the Notitia, it would appear that the walls of Constantinople, as built by the founder of the city in 328, ran across the promontory from the neighbourhood of Daoud Pasha Kapoussi (Porta S. Aemiliani) on the Sea of Marmora to Oun-Kapan Kapoussi (Porta Platæa) on the Golden Horn, near the Stamboul head of the inner bridge, traversing in their course the seventh, fourth, and fifth hills of the promontory. By extending the old seaward walls of Byzantium to the extremities of the new western fortifications, the capital was placed within strong bulwarks. The only vestige of the western walls is found in the name Isa Kapoussi (Gate of Jesus), attached to a locality on the heights above the quarter of Psamathia. An ancient city gate which stood there as late as 1508, when it was overthrown by an earthquake, marked a point in the Constantinian line of fortifications, exactly as Temple Bar indicated a point in the old walls of London long after they had otherwise disappeared. Possibly a portion of the seaward walls bounding the old harbour, which is now converted into the vegetable gardens of Vlanga Bostan, may date from the time of Constantine. Two suburbs outside the walls were considered as parts of the city—the suburb of Sycae (Galata), and the suburb of Blachernae, now the quarters of Aivan Serai and Egri Kapou. The latter suburb stood within fortifications of its own. For municipal purposes the city was divided into fourteen Regions, on the model of Rome. But ere a century had passed, the growth of the new metropolis on the one hand, and military considerations in view of the threatening attitude of the Barbarians on the other, demanded the enlargement of the city's bounds and the erection of stronger defences. Accordingly, in 413, in the reign of Theodosius II., under the direction of Anthemius, Praetorian Prefect of the East and Regent during the emperor's minority, the landward fortifications were carried farther west, to the line of the inner wall in the crumbling but picturesque ramparts which extend from the Sea of Marmora, a short distance south of the Seven Towers (Yedi Koulé), to the old Byzantine Palace (Tekfour Serai), above the quarter of Egri Kapou. Authorities differ on the question how the city was then defended from the last-named point to the Golden Horn; some maintaining that the Theodosian Walls turned north-eastwards and reached the Golden Horn near Balat Kapoussi, others being of the opinion that the new walls joined the old fortifications which protected the suburb of Blachernae. On the whole, the latter view seems the more probable. The seaward walls required by this enlargement of the city were built in 439, during the administration of the Prefect Cyrus.

The wall of Anthemius was, however, terribly injured by a severe earthquake which shook the city in 447, while Theodosius II. was still upon the throne. The disaster was the more serious because Attila and his Huns were then carrying everything before them in the Balkan Peninsula; but the desperateness of the situation roused the energies of the Roman Government to the highest pitch, and in less than two months, if we may trust inscriptions to that effect, the city was again fully armed, and even more secure than before the catastrophe. The Praetorian Prefect Constantine, whom some authorities identify with the Prefect Cyrus named above, not only repaired the wall of Anthemius, but placed another wall in front of it, and protected this double line of fortifications by a moat, with a battlement along its inner margin. Each wall was flanked by ninety-six towers, while the terrace between the two walls, and the terrace between the outer wall and the moat, allowed room for the action of large bodies of troops, in addition to the troops upon the walls themselves. Comparatively slight changes were made in the boundaries of the city after the reign of Theodosius II. The lower portion of the suburb of Blachernae, namely, the plain to the north of the Sixth Hill, was enclosed within fortifications in 627, after the siege of the city by the Avars in the reign of Heraclius; in 813 Leo the Armenian strengthened the wall of Heraclius by constructing a wall and a moat in front of it, thus to withstand better an expected assault by the Bulgarians under Crum; lastly, in the reign of Manuel Comnenus the wall extending from the north-western corner of the court of Tekfour Serai to the square tower below Egri Kapou was erected to defend more effectively the Palace of Blachernae, on the Sixth Hill, which had become the favourite residence of the Byzantine emperors. Of course all these fortifications were frequently repaired (*e.g.,* the seaward walls by the Emperor Theophilus), and to them Constantinople owed her long life and her ability to repel, for more than a thousand years, the assaults of barbarism upon the civilization of Christendom. They present to the archæologist a splendid specimen of mediæval fortifications constructed under the strong influence of old Roman military traditions, and they afford endless interest to the student of history on account of the events associated with them.

The most noteworthy points in the circuit of the walls are: the Golden Gate, in the form of a triumphal arch with three archways, erected (before the Theodosian Walls were built) in honour of the victory of Theodosius the Great over the usurper Maximus; the Gate of S. Romanus (Top Kapoussi), memorable as the gate near which Constantine Dragases fell, and through which Sultan Mahomet II. rode into the captured capital in 1453; the great breach in the valley of the Lycus, through which the Turks entered the city; Tekfour Serai, long erroneously identified with the Palace of the Hebdomon, the finest specimen of Byzantine civil architecture left in the city; the two Towers commonly known respectively as the Towers of Anemas and Isaac Angelus, with the chambers in the body of the wall to the north; the wall of Leo the Armenian, the point at which the army of the Fourth Crusade, which had its camp on the hill opposite, delivered the chief attack in 1203; the wall protecting the quarters of Phanar and Petri Kapou, where the fleet and troops of the Fourth Crusade assaulted and carried the city in 1204, to found the Latin Empire of Constantinople; Yali Kiosk Kapoussi, the point to which the northern end of the chain drawn across the harbour in time of siege was attached; the ruins of the Palace of Hormisdas, once the residence of Justinian the Great and Theodora, known in later times as the Bucoleon, near Tchatlady Kapou; the sites of the old harbours between that gate and Daoud Pasha Kapoussi; the fine Marble Tower near the junction of the Land Walls with the walls along the Sea of Marmora.

The interior arrangements of the city were largely determined by the configuration of its site, which falls naturally into three divisions: the level ground and the slopes towards the Sea of Marmora, the range of hills running through the midland portion of the promontory, the slopes and level ground towards the Golden Horn. In each of these divisions a great street ran from one end of the city to the other, generally lined with arcades on one side, but sometimes, when passing through the busier and the finer parts of the city, on both sides. The street on the ridge of the hills formed the principal thoroughfare, and owing to its central position was known as the Mesé. It connected the principal Fora of the city: the Augustaion (to the south of S. Sophia); the Forum of Constantine (on the summit of the Second Hill); the Forum of Theodosius the Great, or of Taurus (on the summit of the Third Hill, beside the present War Office); the Forum of the Amastrianou

(near the Mosque Shah Zadé); the Forum of the Bous (at Ak Serai); the Forum of Arcadius, or of Theodosius II. (on the summit of the Seventh Hill, at Avret Bazaar). A branch of the Mesé led to the Church of the Holy Apostles, on the summit of the Fourth Hill, and to the Gate of Adrianople (Gate of Charisius) in the city walls.

Of the edifices and monuments which adorned the Fora just mentioned, it must here suffice to say that the Augustaion (so named in honour of Augusta Helena, the mother of Constantine the Great) was the heart of the city's political and ecclesiastical life. The great cathedral of Eastern Christendom rose on the north side of the square; the splendid gateway of the Chalcé, leading to the Imperial Palace, the Baths of Zeuxippus, with the Hippodrome behind them, stood on the south; the Senate House was on the east; while to the west, at a short distance off the Mesé, which issued from the square, were the Law Courts. In the area of the square stood the Milion, whence distances from Constantinople were measured; the equestrian statue of Justinian the Great, on a lofty column; the statue of the Empress Eudoxia, famous in the history of Chrysostom, and the inscribed pedestal of which remains. With the Forum of Constantine the Great the commercial activity of the city was closely associated, the most remarkable monument in the forum being the porphyry column which still stands there, and which carried aloft the statue of that emperor. In the Forum of Theodosius I. rose a column in his honour, constructed on the model of the hollow column of Trajan at Rome; there also stood the Anemodoulion, a beautiful structure surmounted by a vane to indicate the direction of the wind; and close to the Forum, if not within its precints, was the Capitol, in which the University of Constantinople was established. The most conspicuous object in the Forum of the Bous was an ancient bronze figure of an ox, which gave name to the Forum, and beside which criminals were sometimes burned to death. Another hollow column, the pedestal of which still remains, rose in the Forum of Arcadius in honour of that emperor. The city possessed also a column in honour of the Emperor Marcian, which still stands in the valley of the Lycus, below the Mosque of Sultan Mahomet II. In the decoration of the Fora and streets of the city there was a strange mingling of works belonging to good periods of Greek and Roman Art, with works made when Art had fallen on evil days.

An immense number of churches, enriched by the reputed relics of saints, prophets, and martyrs, made Constantinople a holy city, attracting to its shrines devout pilgrims from every part of the empire. Only some twenty of these sanctuaries survive, and most of them are now used as mosques for Moslem worship, exhibiting few traces of the beauty created by the combination of dome and arch, of marble revetment and mosaics. But S. Sophia still impresses the mind as one of the grandest buildings ever reared by human hands, while the Churches of S. Irene, SS. Sergius and Bacchus (Kutchuk Aya Sofia), S. Mary Diaconissa (Kalender Djamissi), S. Saviour of the Chora (Kahriyeh Djamissi), and S. Saviour Pantocrator (Klissé Djamissi) are interesting monuments of Byzantine art. The Church of the Holy Apostles, to which the Imperial Cemetery was attached, on the summit of the Fourth Hill, has been replaced by the Mosque of Sultan Mahomet II., the conqueror of the city.

Of the imperial palaces in and around the city we can mention only the Great Palace, a group of detached edifices scattered over the ground descending to the Sea of Marmora from the Hippodrome and the eastern side of the Augustaion; the Palace of Hormisdas, or of the Bucoleon, near Tchatlady Kapou; the Palace of the Porphyrogenitus, Tekfour Serai; the Palace of Blachernae, in the quarters of Egri Kapou and Aivas Effendi; the suburban Palace of Pegé, at Balukli; the Palace of the Hebdomon, at Makrikeui. The last has generally been identified with Tekfour Serai, but the fact that the suburb and palace at the Hebdomon stood at Makrikeui, beside the Sea of Marmora, at the seventh milestone from the Milion, is one of the surest results of recent archæological investigations. The fortress of the Cyclobion was in the same vicinity.

The Hippodrome, which entered so much into the life of the city, is represented by the large open space to the west of the Mosque of Sultan Achmet. An Egyptian obelisk on a pedestal covered with sculptured work portraying Theodosius I., sometimes accompanied by his empress and his sons, presiding at scenes in the Hippodrome; the Serpent Column, which stood originally at Delphi, in commemoration of the battle of Plataea; and a lofty pile of masonry in the form of an obelisk, once covered with gilded plates of bronze, indicate the line of the Spina; while under the prison and offices along the western side of the area arches are visible, against which seats for the spectators were built.

Water was brought to the city from the country to the west and north-west by aqueducts, sometimes above and sometimes under ground, and was stored within the city in large open reservoirs (now changed into vegetable gardens) and in cisterns covered with vaulted roofs supported on columns. They are important specimens of Byzantine architecture, as the works of Andréossy (*Constantinople et le Bosphore*), of Forchheimer and Strzygowski (*Die Byzantinischen Wasserbehälter von K[illegible]*), and of Choisy (*L'Art de Bâtir chez les Byzantins*) testify. The Aqueduct of Valens spans the valley between the Fourth Hill and the Third Hill of the city, and still carries on its beneficent work. The Cistern of Bin-Bir-Derek (Cistern of Illus) and the Cistern of Yeri-Batan-Serai (Cisterna Basilica) are noteworthy. Much of the water introduced into the city was used in the public baths and fountains, which formed as characteristic a feature of Byzantine Constantinople as similar erections do of Stamboul.

Byzantine Constantinople was a great emporium of trade, and a striking evidence of its commercial activity is seen in the number of harbours with which the city was provided. In addition to the Golden Horn and its bays, several artificial harbours, traces of which remain, were constructed on the shore of the city beside the Sea of Marmora. First (beginning from the east) came the Harbour of the Bucoleon, attached to the palace of that name, for the service of the Imperial Court. Then, at a short distance to the west of Tchatlady Kapou, came the Harbour of the Emperor Julian (Kadriga Limani), or of Sophia, as it was called after its reconstruction by the empress of Justin II.; the Harbour of Condoscalion (Koum Kapou) followed; next came (a little to the east of Yeni Kapou) the Harbour of Kaisarius, or the Heptascalon; then, the Harbour of Theodosius I., or of Eleutherius (Vlanga Bostan); and lastly, the Harbour of the Golden Gate, on the shore south of that entrance.

Besides the works mentioned above, the following will assist the student of the archæology of the city:—PETRUS GYLLIUS. *De Topographia Constantinopoleos et de illius Antiquitatibus.*—DU CANGE. *Constantinopolis Christiana.*—PASPATES. *Βυζαντιναὶ Μελέται.*—SALZENBERG. *Altchristliche Baudenkmale von Konstantinopel*—LETHABY and SWAINSON. *The Church of Sancta Sophia.*—PULGHER. *Les Anciennes Églises Byzantines de Constantinople.*—LABARTE. *Le Palais Impérial de Constantinople et ses Abords.*—MORDTMANN. *Esquisse Topographique de Constantinople.*

(A. VAN M.)

**Contract.**—The purpose of this article is not to give technical details and authorities for professional use, but to exhibit the characteristic features of English law in connexion with their historical and rational grounds. Enforcement of good faith in matters of bargain and promise is among the most important functions of legal justice in modern civilized countries. It might not be too much to say that, next after keeping the peace and securing property against violence and fraud so that business may be possible, it is the most important. Yet we shall find that the importance of contract is developed comparatively late in the history of law. The commonwealth needs elaborate rules about contracts only when it is advanced enough in civilization and trade to have an elaborate system of credit. The Roman law of the empire dealt with contract, indeed, in a fairly adequate manner, though it never had a complete or uniform theory; and the Roman law, as settled by Justinian, appears to have satisfied the Eastern empire long after the Western nations had begun to recast their institutions, and the traders of the Mediterranean had struck out a cosmopolitan body of rules, known as the Law Merchant, which claimed acceptance in the name neither of Justinian nor of the Church, but of universal reason. It was amply proved afterwards that the foundations of the Roman system were strong enough to carry the fabric of modern legislation. But the collapse of the Roman power in western Christendom threw society back into chaos, and reduced men's ideas of ordered justice and law to a condition compared with which the earliest Roman law known to us is modern.

In this condition of legal ideas, which it would be absurd to call jurisprudence, the general duty of keeping faith is not recognized except as a matter of religious or social observance. Those who desire to be assured of anything that lies in promise must exact an oath, or a pledge, or personal sureties; and even then the court of their people—in England the Hundred Court in the first instance—will do nothing for them in the first case, and not much in the two latter. It is more a question of acquiring a good title to help one's self than of becoming entitled to active assistance from any person in authority.

Probably the settlement of a blood-feud, with provisions for the payment of the fine by instalments, was the nearest approach to a continuing contract, as we now understand the term, which the experience of Germanic antiquity could furnish. It is also probable that the performance of such undertakings, as it concerned the general peace, was at an early time regarded as material to the commonweal; and that these covenants of peace, rather than the rudimentary selling and bartering of their day, first caused our Germanic ancestors to realize the importance of putting some promises at any rate under public sanction. We have not now to attempt any reconstruction of archaic judgment and justice, or the lack of either, at any period of the darkness and twilight which precede the history of the Middle Ages. But the history of the law, and even the present form of much law still common to almost all the English-speaking world, can be understood only when we bear in mind that our forefathers did not start from any general conception of the State's duty to enforce private agreements, but, on the contrary, the State's powers and functions in this regard were extended gradually, unsystematically, and by shifts and devices of ingenious suitors and counsel, aided by judges, rather than by any direct provisions of princes and rulers. Money debts, it is true, were recoverable from an early time. But this was not because the debtor had promised to repay the loan; it was because the money was deemed still to belong to the creditor, as if the identical coins were merely in the debtor's custody. The creditor sued to recover money, for centuries after the Norman Conquest, in exactly the same form which he would have used to demand possession of land; the action of debt closely resembled the "real actions," and, like them, might be finally determined by a judicial combat; and down to Blackstone's time the creditor was said to have a property in the debt—property which the debtor had "granted" him. Giving credit, in this way of thinking, is not reliance on the right to call hereafter for an act, the payment of so much current money or its equivalent, to be performed by the debtor, but merely suspension of the immediate right to possess one's own particular money, as the owner of a house let for a term suspends his right to occupy it. This was no road to the modern doctrine of contract, and the passage had to be made another way.

***Action for debt.***

In fact the old action of debt covered part of the ground of contract only by accident. It was really an action to recover any property that was not land; for the remedy of a dispossessed owner of chattels, afterwards known as Detinue, was only a slightly varying form of it. If the property claimed was a certain sum of money, it might be due because the defendant had received money on loan, or because he had received goods of which the agreed price remained unpaid; or, in later times at any rate, because he had become liable in some way by judgment, statute, or other authority of law, to pay a fine or fixed penalty to the plaintiff. Here the person recovering might be as considerable as the lord of a manor, or as mean as a "common informer"; the principle was the same. In every case outside this last class, that is to say, whenever there was a debt in the popular sense of the word, it had to be shown that the defendant had actually received the money or goods; this value received came to be called *quid pro quo*—a term unknown, to all appearance, out of England. Nevertheless the foundation of the plaintiff's right was not bargain or promise, but the unjust detention by the defendant of the plaintiff's money or goods.

***Modes of proof.***

We are not concerned here to trace the change from the ancient method of proof—oath backed by "good suit," *i.e.*, the oaths of an adequate number of friends and neighbours—through the earlier form of jury trial, in which the jury were supposed to know the truth of their own knowledge, to the modern establishment of facts by testimony brought before a jury who are bound to give their verdict according to the evidence. But there was one mode of proof which, after the Norman Conquest, made a material addition to the substantive law. This was the proof by writing, which means writing authenticated by seal. Proof by writing was admitted under Roman influence, but, once admitted, it acquired the character of being conclusive which belonged to all proof in early Germanic procedure. Oath, ordeal, and battle were all final in their results. When the process was started there was no room for discussion. So the sealed writing was final too, and a man could not deny his own deed. We still say that he cannot, but with modern refinements. Thus the deed, being allowed as a solemn and probative document, furnished a means by which a man could bind himself, or rather effectually declare himself bound, to anything not positively forbidden by law. Whoever could afford parchment and the services of a clerk might have the benefit of a "formal contract" in the Roman sense of the term. At this day the form of deed called a bond or "obligation" is, as it stands settled after various experiments, extremely artificial; but it is essentially a solemn admission of liability, though its conclusive stringency has been relaxed by modern legislation and practice in the interest of substantial justice. By this means the performance of all sorts of undertakings, pecuniary and otherwise, could be and was legally secured. Bonds were well known in the 13th century, and from the 14th century onwards were freely used for commercial and other purposes; as for certain limited purposes they still are. The "covenant" of modern draftsmen is a direct promise made by deed; it occurs mainly as incident to conveyances of land. The mediæval "covenant," *conventio*, was, when we first hear of it, practically equivalent to a lease, and never became a common instrument of miscellaneous contracting, though the old books recognize the possibility of turning it to various uses of which there are examples; nor had it any sensible influence on the later development of the law. On the whole, in the old common law one could do a great deal by deed, but very little without deed. The minor bargains of daily life, so far as they involved mutual credit, were left to the jurisdiction of inferior courts, of the Law Merchant, and—last, not least—of the Church.

Popular custom, in all European countries, recognized simpler ways of pledging faith than parchment and seal. A handshake was enough to bind a bargain. Whatever secular law might say, the Church said it was an open sin to break plighted faith; a matter, therefore, for spiritual correction, in other words, for compulsion exercised on the defaulter by the bishop's or the archdeacon's court, armed with the power of excommunication. In this way the ecclesiastical courts acquired much business which was, in fact, as secular as that of a modern county court, with the incident profits. Mediæval courts lived by the suitors' fees. What were the king's judges to do? However high they put their claims in the course of the rivalry between Church and Crown, they could not effectually prohibit the bishop or his official from dealing with matters for which the king's court provided no remedy. Continental jurists had seen their way, starting from the Roman system as it was left by Justinian, to reduce its formalities to a vanishing quantity, and expand their jurisdiction to the full breadth of current usage. English judges could not do this in the 15th century, if they could ever have done so. Nor would simplification of the requisites of a deed, such as

has now been introduced in many jurisdictions, have been of much use at a time when only a minority even of well-to-do laymen could write with any facility.

There was no principle and no form of action in English law which recognized any general duty of keeping promises. But could not breach of faith by which a party had suffered be treated as some kind of legal wrong? There was a known action of trespass and a known action of deceit, this last of a special kind, mostly for what would now be called abuse of the process of the court; but in the later Middle Ages it was an admitted remedy for giving a false warranty on a sale of goods. Also there was room for actions "on the case," on facts analogous to those covered by the old writs, though not precisely within their terms. If the king's judges were to capture this important branch of business from the clerical hands which threatened to engross it, the only way was to devise some new form of action on the case. There were signs, moreover, that the Court of Chancery would not neglect so promising a field if the Common Law judges left it open.

***Assumpsit.***

The mere fact of unfulfilled promise was not enough, in the eyes of mediæval English lawyers, to give a handle to the law. But injury caused by reliance on another man's undertaking was different. The special undertaking or "assumption" creates a duty which is broken by fraudulent or incompetent miscarriage in the performance. I profess to be a skilled farrier, and lame your horse. It is no trespass, because you trusted the horse to me; but it is something like a trespass, and very like a deceit. I profess to be a competent builder; you employ me to build a house, and I scamp the work so that the house is not fit to live in. An action on the case was allowed without much difficulty for such defaults. The next step, and a long one, was to provide for total failure to perform. The builder, instead of doing bad work, does nothing at all within the time agreed upon for completing the house. Can it be said that he has done a wrong? At first the judges felt bound to hold that this was going too far; but suitors anxious to have the benefit of the king's justice persevered, and in the course of the 15th century the new form of action, called *assumpsit* from the statement of the defendant's undertaking on which it was founded, was allowed as a remedy for non-performance as well as for faulty performance. Being an action for damages, and not for a certain amount, it escaped the strict rules of proof which applied to the old action of debt; being in form for a kind of trespass, and thus a privileged appeal to the king to do right for a breach of his peace, it escaped likewise the risk of the defendant clearing himself by oath according to the ancient popular procedure. Hence, as time went on, suitors were emboldened to use "assumpsit" as an alternative for debt, though it had been introduced only for cases where there was no other remedy. By the end of the 16th century they got their way; and it became a settled doctrine that the existence of a debt was enough for the court to presume an undertaking to pay it. The new form of action was made to cover the whole ground of informal contracts, and, by extremely ingenious devices of pleading, developed from the presumption or fiction that a man had promised to pay what he ought, it was extended in time to a great variety of cases where there was in fact no contract at all.

***Consideration.***

The new system gave no new force to gratuitous promises. For it was assumed, as the foundation of the jurisdiction, that the plaintiff had been induced by the defendant's undertaking, and with the defendant's consent, to alter his position for the worse in some way. He had paid or bound himself to pay money, he had parted with goods, he had spent time in labour, or he had foregone some profit or legal right. If he had not committed himself to anything on the strength of the defendant's promise, he had suffered no damage and had no cause of action. Disappointment of expectations is unpleasant, but it is not of itself *damnum* in a legal sense. To sum up the effect of this in modern language, the plaintiff must have given value of some kind, more or less, for the defendant's undertaking. This something given by the promisee and accepted by the promisor in return for his undertaking is what we now call the *consideration* for the promise. In cases where debt would also lie, it coincides with the old requirement of value received (*quid pro quo*) as a condition of the action of debt being available. But the conception is far wider, for the consideration for a promise need not be anything capable of delivery or possession. It may be money or goods; but it may also be an act or series of acts; further (and this is of the first importance for our modern law), it may itself be a promise to pay money or deliver goods, or to do work, or otherwise to act or not to act in some specified way. Again, it need not be anything which is obviously for the promisor's benefit. His acceptance shows that he set some value on it; but in truth the promisee's burden, and not the promisor's benefit, is material. The last refinement of holding that, when mutual promises are exchanged between parties, each promise is a consideration for the other and makes it binding, was conclusively accepted only in the 17th century. The result was that promises of mere bounty could no more be enforced than before, but any kind of lawful bargain could; and there is no reason to doubt that this was in substance what most men wanted. Ancient popular usage and feeling show little more encouragement than ancient law itself to merely gratuitous alienation or obligations. Also (subject, till quite modern times, to the general rule of common-law procedure that parties could not be their own witnesses, and subject to various modern statutory requirements in various classes of cases) no particular kind of proof was necessary. The necessity of consideration for the validity of simple contracts was unfortunately confused by commentators, almost from the beginning of its history, with the perfectly different rules of the Roman law about *nudum pactum*, which very few English lawyers took the pains to understand. Hasty comparison of misunderstood Roman or canon law is answerable for a large proportion of the worst faults in our old-fashioned text-books. Doubtless many canonists, probably some common lawyers, and possibly some of the judges of the Renaissance time, supposed that *ex nudo pacto non oritur actio* was in some way a proposition of universal reason; but it is a long way from this to concluding that the Roman law had any substantial influence on the English.

The doctrine of consideration is in fact peculiar to those jurisdictions where the common law of England is in force, or is the foundation of the received law. Substantially similar results are obtained in other modern systems by professing to enforce all deliberate promises, but imposing stricter conditions of proof where the promise is gratuitous.

***Deeds.***

As obligations embodied in the solemn form of a deed were thereby made enforceable before the doctrine of consideration was known, so they still remain. When a man has by deed declared himself bound, there is no need to look for any bargain, or even to ask whether the other party has assented. This rugged fragment of ancient law remains embedded in our elaborate modern structure. Nevertheless gratuitous promises, even by deed, get only their strict and bare rights. There may be an action upon them, but the powerful remedy of specific performance—often the only one worth having—is denied them. For this is derived from the extraordinary jurisdiction of the Chancellor, and the equity administered

Probably the settlement of a blood-feud, with provisions for the payment of the fine by instalments, was the nearest approach to a continuing contract, as we now understand the term, which the experience of Germanic antiquity could furnish. It is also probable that the performance of such undertakings, as it concerned the general peace, was at an early time regarded as material to the commonweal; and that these covenants of peace, rather than the rudimentary selling and bartering of their day, first caused our Germanic ancestors to realize the importance of putting some promises at any rate under public sanction. We have not now to attempt any reconstruction of archaic judgment and justice, or the lack of either, at any period of the darkness and twilight which precede the history of the Middle Ages. But the history of the law, and even the present form of much law still common to almost all the English-speaking world, can be understood only when we bear in mind that our forefathers did not start from any general conception of the State's duty to enforce private agreements, but, on the contrary, the State's powers and functions in this regard were extended gradually, unsystematically, and by shifts and devices of ingenious suitors and counsel, aided by judges, rather than by any direct provisions of princes and rulers. Money debts, it is true, were recoverable from an early time. But this was not because the debtor had promised to repay the loan; it was because the money was deemed still to belong to the creditor, as if the identical coins were merely in the debtor's custody. The creditor sued to recover money, for centuries after the Norman Conquest, in exactly the same form which he would have used to demand possession of land; the action of debt closely resembled the "real actions," and, like them, might be finally determined by a judicial combat; and down to Blackstone's time the creditor was said to have a property in the debt—property which the debtor had "granted" him. Giving credit, in this way of thinking, is not reliance on the right to call hereafter for an act, the payment of so much current money or its equivalent, to be performed by the debtor, but merely suspension of the immediate right to possess one's own particular money, as the owner of a house let for a term suspends his right to occupy it. This was no road to the modern doctrine of contract, and the passage had to be made another way.

*Action for debt.*

In fact the old action of debt covered part of the ground of contract only by accident. It was really an action to recover any property that was not land; for the remedy of a dispossessed owner of chattels, afterwards known as Detinue, was only a slightly varying form of it. If the property claimed was a certain sum of money, it might be due because the defendant had received money on loan, or because he had received goods of which the agreed price remained unpaid; or, in later times at any rate, because he had become liable in some way by judgment, statute, or other authority of law, to pay a fine or fixed penalty to the plaintiff. Here the person recovering might be as considerable as the lord of a manor, or as mean as a "common informer"; the principle was the same. In every case outside this last class, that is to say, whenever there was a debt in the popular sense of the word, it had to be shown that the defendant had actually received the money or goods; this value received came to be called *quid pro quo*—a term unknown, to all appearance, out of England. Nevertheless the foundation of the plaintiff's right was not bargain or promise, but the unjust detention by the defendant of the plaintiff's money or goods.

*Modes of proof.*

We are not concerned here to trace the change from the ancient method of proof—oath backed by "good suit," *i.e.*, the oaths of an adequate number of friends and neighbours—through the earlier form of jury trial, in which the jury were supposed to know the truth of their own knowledge, to the modern establishment of facts by testimony brought before a jury who are bound to give their verdict according to the evidence. But there was one mode of proof which, after the Norman Conquest, made a material addition to the substantive law. This was the proof by writing, which means writing authenticated by seal. Proof by writing was admitted under Roman influence, but, once admitted, it acquired the character of being conclusive which belonged to all proof in early Germanic procedure. Oath, ordeal, and battle were all final in their results. When the process was started there was no room for discussion. So the sealed writing was final too, and a man could not deny his own deed. We still say that he cannot, but with modern refinements. Thus the deed, being allowed as a solemn and probative document, furnished a means by which a man could bind himself, or rather effectually declare himself bound, to anything not positively forbidden by law. Whoever could afford parchment and the services of a clerk might have the benefit of a "formal contract" in the Roman sense of the term. At this day the form of deed called a bond or "obligation" is, as it stands settled after various experiments, extremely artificial; but it is essentially a solemn admission of liability, though its conclusive stringency has been relaxed by modern legislation and practice in the interest of substantial justice. By this means the performance of all sorts of undertakings, pecuniary and otherwise, could be and was legally secured. Bonds were well known in the 13th century, and from the 14th century onwards were freely used for commercial and other purposes; as for certain limited purposes they still are. The "covenant" of modern draftsmen is a direct promise made by deed; it occurs mainly as incident to conveyances of land. The mediæval "covenant," *conventio*, was, when we first hear of it, practically equivalent to a lease, and never became a common instrument of miscellaneous contracting, though the old books recognize the possibility of turning it to various uses of which there are examples; nor had it any sensible influence on the later development of the law. On the whole, in the old common law one could do a great deal by deed, but very little without deed. The minor bargains of daily life, so far as they involved mutual credit, were left to the jurisdiction of inferior courts, of the Law Merchant, and—last, not least—of the Church.

Popular custom, in all European countries, recognized simpler ways of pledging faith than parchment and seal. A handshake was enough to bind a bargain. Whatever secular law might say, the Church said it was an open sin to break plighted faith; a matter, therefore, for spiritual correction, in other words, for compulsion exercised on the defaulter by the bishop's or the archdeacon's court, armed with the power of excommunication. In this way the ecclesiastical courts acquired much business which was, in fact, as secular as that of a modern county court, with the incident profits. Mediæval courts lived by the suitors' fees. What were the king's judges to do? However high they put their claims in the course of the rivalry between Church and Crown, they could not effectually prohibit the bishop or his official from dealing with matters for which the king's court provided no remedy. Continental jurists had seen their way, starting from the Roman system as it was left by Justinian, to reduce its formalities to a vanishing quantity, and expand their jurisdiction to the full breadth of current usage. English judges could not do this in the 15th century, if they could ever have done so. Nor would simplification of the requisites of a deed, such as

has now been introduced in many jurisdictions, have been of much use at a time when only a minority even of well-to-do laymen could write with any facility.

There was no principle and no form of action in English law which recognized any general duty of keeping promises. But could not breach of faith by which a party had suffered be treated as some kind of legal wrong? There was a known action of trespass and a known action of deceit, this last of a special kind, mostly for what would now be called abuse of the process of the court; but in the later Middle Ages it was an admitted remedy for giving a false warranty on a sale of goods. Also there was room for actions "on the case," on facts analogous to those covered by the old writs, though not precisely within their terms. If the king's judges were to capture this important branch of business from the clerical hands which threatened to engross it, the only way was to devise some new form of action on the case. There were signs, moreover, that the Court of Chancery would not neglect so promising a field if the Common Law judges left it open.

The mere fact of unfulfilled promise was not enough, in the eyes of mediæval English lawyers, to give a handle to the law. But injury caused by reliance on another man's undertaking was different. The special undertaking or "assumption" creates a duty which is broken by fraudulent or incompetent miscarriage in the performance. I profess to be a skilled farrier, and lame your horse. It is no trespass, because you trusted the horse to me; but it is something like a trespass, and very like a deceit. I profess to be a competent builder; you employ me to build a house, and I scamp the work so that the house is not fit to live in. An action on the case was allowed without much difficulty for such defaults. The next step, and a long one, was to provide for total failure to perform. The builder, instead of doing bad work, does nothing at all within the time agreed upon for completing the house. Can it be said that he has done a wrong? At first the judges felt bound to hold that this was going too far; but suitors anxious to have the benefit of the king's justice persevered, and in the course of the 15th century the new form of action, called *assumpsit* from the statement of the defendant's undertaking on which it was founded, was allowed as a remedy for non-performance as well as for faulty performance. Being an action for damages, and not for a certain amount, it escaped the strict rules of proof which applied to the old action of debt; being in form for a kind of trespass, and thus a privileged appeal to the king to do right for a breach of his peace, it escaped likewise the risk of the defendant clearing himself by oath according to the ancient popular procedure. Hence, as time went on, suitors were emboldened to use "assumpsit" as an alternative for debt, though it had been introduced only for cases where there was no other remedy. By the end of the 16th century they got their way; and it became a settled doctrine that the existence of a debt was enough for the court to presume an undertaking to pay it. The new form of action was made to cover the whole ground of informal contracts, and, by extremely ingenious devices of pleading, developed from the presumption or fiction that a man had promised to pay what he ought, it was extended in time to a great variety of cases where there was in fact no contract at all.

**Assumpsit.**

The new system gave no new force to gratuitous promises. For it was assumed, as the foundation of the jurisdiction, that the plaintiff had been induced by the defendant's undertaking, and with the defendant's consent, to alter his position for the worse in some way. He had paid or bound himself to pay money, he had parted with goods, he had spent time in labour, or he had foregone some profit or legal right. If he had not committed himself to anything on the strength of the defendant's promise, he had suffered no damage and had no cause of action. Disappointment of expectations is unpleasant, but it is not of itself *damnum* in a legal sense. To sum up the effect of this in modern language, the plaintiff must have given value of some kind, more or less, for the defendant's undertaking. This something given by the promisee and accepted by the promisor in return for his undertaking is what we now call the *consideration* for the promise. In cases where debt would also lie, it coincides with the old requirement of value received (*quid pro quo*) as a condition of the action of debt being available. But the conception is far wider, for the consideration for a promise need not be anything capable of delivery or possession. It may be money or goods; but it may also be an act or series of acts; further (and this is of the first importance for our modern law), it may itself be a promise to pay money or deliver goods, or to do work, or otherwise to act or not to act in some specified way. Again, it need not be anything which is obviously for the promisor's benefit. His acceptance shows that he set some value on it; but in truth the promisee's burden, and not the promisor's benefit, is material. The last refinement of holding that, when mutual promises are exchanged between parties, each promise is a consideration for the other and makes it binding, was conclusively accepted only in the 17th century. The result was that promises of mere bounty could no more be enforced than before, but any kind of lawful bargain could; and there is no reason to doubt that this was in substance what most men wanted. Ancient popular usage and feeling show little more encouragement than ancient law itself to merely gratuitous alienation or obligations. Also (subject, till quite modern times, to the general rule of common-law procedure that parties could not be their own witnesses, and subject to various modern statutory requirements in various classes of cases) no particular kind of proof was necessary. The necessity of consideration for the validity of simple contracts was unfortunately confused by commentators, almost from the beginning of its history, with the perfectly different rules of the Roman law about *nudum pactum*, which very few English lawyers took the pains to understand. Hasty comparison of misunderstood Roman or canon law is answerable for a large proportion of the worst faults in our old-fashioned text-books. Doubtless many canonists, probably some common lawyers, and possibly some of the judges of the Renaissance time, supposed that *ex nudo pacto non oritur actio* was in some way a proposition of universal reason; but it is a long way from this to concluding that the Roman law had any substantial influence on the English.

**Consideration.**

The doctrine of consideration is in fact peculiar to those jurisdictions where the common law of England is in force, or is the foundation of the received law. Substantially similar results are obtained in other modern systems by professing to enforce all deliberate promises, but imposing stricter conditions of proof where the promise is gratuitous.

As obligations embodied in the solemn form of a deed were thereby made enforceable before the doctrine of consideration was known, so they still remain. When a man has by deed declared himself bound, there is no need to look for any bargain, or even to ask whether the other party has assented. This rugged fragment of ancient law remains embedded in our elaborate modern structure. Nevertheless gratuitous promises, even by deed, get only their strict and bare rights. There may be an action upon them, but the powerful remedy of specific performance—often the only one worth having—is denied them. For this is derived from the extraordinary jurisdiction of the Chancellor, and the equity administered

**Deeds.**

by the Chancellor was not for plaintiffs who could not show substantial merit as well as legal claims. The singular position of promises made by deed is best left out of account in considering the general doctrine of the formation of contracts; and as to interpretation there is no difference. In what follows, therefore, it will be needless, as a rule, to distinguish between "parol" or "simple" contracts, that is, contracts not made by deed, and obligations undertaken by deed.

From the conception of a promise being valid only when given in return for something accepted in consideration of the promise, it follows that the giving of the promise and of the consideration must be simultaneous. Words of promise uttered before there is a consideration for them can be no more than an offer; and, on the other hand, the obligation declared in words, or inferred from acts and conduct, on the acceptance of a consideration, is fixed at that time, and cannot be varied by subsequent declaration, though such declarations may be material as admissions. It was a long while, however, before this consequence was clearly perceived. In the 18th century it was attempted, and for a time with considerable success, to extend the range of enforceable promises without regard to what the principles of the law would bear, in order to satisfy a sense of natural justice. This movement was checked only within living memory, and traces of it remain in certain apparently anomalous rules which are indeed of little practical importance, but which private writers, at any rate, cannot safely treat as obsolete. However, the question of "past consideration" is too minute and technical to be pursued here. The general result is that a binding contract is regularly constituted by the acceptance of an offer, and at the moment when it is accepted; and, however complicated the transaction may be, there must always, in the theory of English law, be such a moment in every case where a contract is formed. It also follows that an offer before acceptance creates no duty of any kind ("A revocable promise is unknown to our law"—Anson); which is by no means necessarily the case in systems where the English rule of consideration is unknown. The question what amounts to final acceptance of an offer is, on the other hand, a question ultimately depending on common sense, and must be treated on similar lines in all civilized countries where the business of life is carried on in a generally similar way. The rules that an offer is understood to be made only for a reasonable time, according to the nature of the case, and lapses if not accepted in due time; that an expressed revocation of an offer can take effect only if communicated to the other party before he has accepted; that acceptance of an offer must be according to its terms, and a conditional or qualified acceptance is only a new proposal, and the like, may be regarded as standing on general convenience as much as on any technical ground.

**Correspondence.**

Great difficulties have arisen, and in other systems as well as in the English, as to the completion of contracts between persons at a distance. There must be some rule, and yet any rule that can be framed must seem arbitrary in some cases. On the whole our modern doctrine is to some such effect as the following:—

The proposer of a contract can prescribe or authorize any mode, or at least any reasonable mode, of acceptance, and if he specifies none he is deemed to authorize the use of any reasonable mode in common use, and especially the post. Acceptance in words is not always required; an offer may be well accepted by an act clearly referable to the proposed agreement, and constituting the whole or part of the performance asked for—say the despatch of goods in answer to an order by post, or the doing of work bespoken; and it seems that in such cases further communication—unless expressly requested—is not necessary as matter of law, however prudent and desirable it may be. Where a promise and not an act is sought (as where a tradesman writes a letter offering goods for sale on credit), it must be communicated; in the absence of special direction letter post or telegraph may be used; and, further, the acceptor having done his part when his answer is committed to the post, English courts now hold (after much discussion and doubt) that any delay or miscarriage in course of post is at the proposer's risk, so that a man may be bound by an acceptance he never received. It is generally thought—though there is no English decision—that, in conformity with this last rule, a revocation by telegraph of an acceptance already posted would be inoperative. Much more elaborate rules than the English rules are laid down in some Continental codes. It seems doubtful whether their complication achieves any gain of substantial justice worth the price. At first sight it looks easy to solve some of the difficulties by admitting an interval during which one party is bound and the other not. But, apart from the risk of starting fresh problems as hard as the old ones, English principles, as above said, require a contract to be concluded between the parties at one point of time, and any exception to this would have to be justified by very strong grounds of expediency. We have already assumed, but it should be specifically stated, that neither offers nor acceptances are confined to communications made in spoken or written words. Acts or signs may and constantly do signify proposal and assent. One does not in terms request a ferryman to put one across the river. Stepping into the boat is an offer to pay the usual fare for being ferried over, and the ferryman accepts it by putting off. This is a very simple case, but the principle is the same in all cases. Acts fitted to convey to a reasonable man the proposal of an agreement, or the acceptance of a proposal he has made, are as good in law as equivalent express words. The term "implied contract" is current in this connexion, but it is unfortunately ambiguous. It sometimes means a contract concluded by acts, not words, of one or both parties, but still a real agreement; sometimes an obligation imposed by law where there is not any agreement in fact.

**Interpretation.**

The obligation of contract is an obligation created and determined by the will of the parties. Herein is the characteristic difference of contract from all other branches of law. The business of the law, therefore, is to give effect so far as possible to the intention of the parties, and all the rules for interpreting contracts go back to this fundamental principle and are controlled by it. Every one knows that its application is not always obvious. Parties often express themselves obscurely; still oftener they leave large parts of their intention unexpressed, or (which for the law is the same thing) have not formed any intention at all as to what is to be done in certain events. But even where the law has to fill up gaps by judicial conjecture, the guiding principle still is, or ought to be, the consideration of what either party has given the other reasonable cause to expect of him. The court aims not at imposing terms on the parties, but at fixing the terms left blank as the parties would or reasonably might have fixed them if all the possibilities had been clearly before their minds. For this purpose resort must be had to various tests: the court may look to the analogy of what the parties have expressly provided for other specified events, to the constant or general usage of persons engaged in like business, and, at need, ultimately to the court's own sense of what is just and expedient. All auxiliary rules of this kind

are subject to the actual will of the parties, and are applied only for want of sufficient declaration of it by the parties themselves. A rule which can take effect against the judicially known will of the parties is not a rule of construction or interpretation, but a positive rule of law. However artificial some rules of construction may seem, this test will always hold. In modern times the courts have avoided laying down new rules of construction, preferring to keep a free hand and deal with each case on its merits as a whole.

*Evidence.*

There are certain rules of evidence which to some extent guide or restrain interpretation. In particular, oral testimony is not allowed to vary the terms of an agreement reduced to writing. This is really in aid of the parties' deliberate intention, for the object of reducing terms to writing is to make them certain. There are apparent exceptions to the rule, of which the most conspicuous is the admission of evidence to show that words were used in a special meaning current in the place or trade in question. But they are reducible, it will be found, to applications (perhaps over-subtle in some cases) of the still more general principles that, before giving legal force to a document, we must know that it is really what it purports to be, and that when we do give effect to it according to its terms we must be sure of what its terms really say. The rules of evidence here spoken of are modern, and have nothing to do with the archaic rule already mentioned as to the effect of a deed.

*Performance.*

Every contracting party is bound to perform his promise according to its terms, and in case of any doubt in the sense in which the other party would reasonably understand the promise. Where the performance on one or both sides extends over an appreciable time, continuously or by instalments, questions may arise as to the right of either party to refuse or suspend further performance on the ground of some default on the other side. Attempts to lay down hard and fast rules on such questions are now discouraged, the aim of the courts being to give effect to the true substance and intent of the contract in every case. Nor will the court hold one part of the terms deliberately agreed to more or less material than another in modern business dealings. "In the contracts of merchants time is of the essence," as the Supreme Court of the United States has said in our own day. Certain ancient rules restraining the apparent literal effect of common provisions in mortgages and other instruments were in truth controlling rules of policy. New rules of this kind can be made only by legislation. Whether the parties did or did not in fact intend the obligation of a contract to be subject to unexpressed conditions is, however, a possible and not uncommon question of interpretation. One class of cases giving rise to such questions is that in which performance becomes impossible by some external cause not due to the promisor's own fault. As to promises obviously absurd or impossible from the first, they are unenforceable only on the ground that the parties cannot have seriously meant to create a liability. For precisely the same reason, supported by the general usage and understanding of mankind, common social engagements, though they often fulfil all other requisites of a contract, have never been treated as binding in law.

*Illegality.*

In all matters of contract, as we have said, the ascertained will of the parties prevails. But this means a will both lawful and free. Hence there are limits to the force of the general rule, fixed partly by the law of the land, which is above individual will and interests, partly by the need of securing good faith and justice between the parties themselves against fraud or misadventure. Agreements cannot be enforced when their performance would involve an offence against the law. There may be legal offence, it must be remembered, not only in acts commonly recognized as criminal, disloyal, or immoral, but in the breach or non-observance of positive regulations made by the Legislature, or persons having statutory authority, for a great variety of purposes. It would be useless to give details on the subject here. Again, there are cases where an agreement may be made and performed without offending the law, but on grounds of "public policy" it is not thought right that the performance should be a matter of legal obligation, even if the ordinary conditions of an enforceable contract are satisfied. A man may bet, in private at any rate, if he likes, and pay or receive as the event may be; but for many years the winner has had no right of action against the loser. Unfortunate timidity on the part of the judges, who attempted to draw distinctions instead of saying boldly that they would not entertain actions on wagers of any kind, threw this topic into the domain of legislation; and the laudable desire of Parliament to discourage gambling, so far as might be, without attempting impossible prohibitions, has brought the law to a state of ludicrous complexity in both civil and criminal jurisdiction. But what is really important under this doctrine of public policy is the confinement of "contracts in restraint of trade" within special limits. In the Middle Ages and down to modern times there was a strong feeling—not merely an artificial legal doctrine—against monopolies and everything tending to monopoly. Agreements to keep up prices or not to compete were regarded as criminal. Gradually it was found that some kind of limited security against competition must be allowed if such transactions as the sale of a going concern with its goodwill, or the retirement of partners from a continuing firm, or the employment of confidential servants in matters involving trade secrets, were to be carried on to the satisfaction of the parties. Attempts to lay down fixed rules in these matters were made from time to time, but they were finally discredited by the decision of the House of Lords in the Maxim-Nordenfelt Company's case in 1894. Contracts "in restraint of trade" will now be held valid, provided that they are made for valuable consideration (this even if they are made by deed), and do not go beyond what can be thought reasonable for the protection of the interests concerned, and are not injurious to the public. (The Indian Contract Act, passed in 1872, has unfortunately embodied views now obsolete, and remains unamended.) All that remains of the old rules in England is the necessity of valuable consideration, whatever be the form of the contract, and a strong presumption—but not an absolute rule of law—that an unqualified agreement not to carry on a particular business is not reasonable.

*Fraud.*

Where there is no reason in the nature of the contract for not enforcing it, the consent of a contracting party may still not be binding on him because not given with due knowledge, or, if he is in a relation of dependence to the other party, with independent judgment. Inducing a man by deceit to enter into a contract may always be treated by the deceived party as a ground for avoiding his obligation, if he does so within a reasonable time after discovering the truth, and, in particular, before any innocent third person has acquired rights for value on the faith of the contract (see FRAUD). Coercion would be treated on principle in the same way as fraud, but such cases hardly occur in modern times. There is a kind of moral domination, however, which our courts watch with the utmost jealousy, and repress under the name of "undue influence" when it is used to obtain pecuniary advantage. Persons in a position of legal or practical authority — guardians, confidential advisers, spiritual directors, and the like—must not abuse their

authority for selfish ends. They are not forbidden to take benefits from those who depend on them or put their trust in them; but if they do, and the givers repent of their bounty, the whole burden of proof is on the takers to show that the gift was in the first instance made freely and with understanding. Large voluntary gifts or beneficial contracts, outside the limits within which natural affection and common practice justify them, are indeed not encouraged in any system of civilized law. Professional money-lenders were formerly checked by the usury laws: now that no rate of interest is in itself unlawful, courts and juries have shown a certain astuteness in applying the rules of law as to fraud and undue influence—the latter with certain special features—to transactions with needy "expectant heirs" and other improvident persons which seem on the whole unconscionable. In the case of both fraud and undue influence, the person entitled to avoid a contract may, if so advised, ratify it afterwards; and ratification, if made with full knowledge and free judgment, is irrevocable. A contract made with a person deprived by unsound mind or intoxication of the capacity to form a rational judgment is on the same footing as a contract obtained by fraud, if the want of capacity is apparent to the other party.

There are many cases in which a statement made by one party to the other about a material fact will enable the other to avoid the contract if he has relied on it, and it was in fact untrue, though it may have been made at the time with honest belief in its truth. This is so wherever, according to the common course of business, it is one party's business to know the facts, and the other practically must, or reasonably may, take the facts from him. In some classes of cases even inadvertent omission to disclose any material fact is treated as a misrepresentation. Contracts of insurance are the most important; here the insurer very seldom has the means of making any effective inquiry of his own. Misdescription of real property on a sale, without fraud, may according to its importance be a matter for compensation or for setting aside the contract. Promoters of companies are under special duties as to good faith and disclosure which have been worked out at great length in the modern decisions. But company law has become so complex within the present generation that, so far from throwing much light on larger principles, it is hardly intelligible without some previous grasp of them. Sometimes it is said that misrepresentation (apart from fraud) of any material fact will serve to avoid any and every kind of contract. It is submitted that this is certainly not the law as to the sale of goods or as to the contract to marry, and therefore the alleged universal rule does not exist. But it must be remembered that parties can, if they please, and not necessarily by the express terms of the contract itself, make the validity of their contract conditional on the existence of any matter of fact whatever, including the correctness of any particular statement. If they have done this, and the fact is not so, the contract has no force; not because there has been a misrepresentation, but because the parties agreed to be bound if the fact was so and not otherwise. It is a question of interpretation whether in a given case there was any such condition.

Mistake is said to be a ground for avoiding contracts, and there are cases which it is practically convenient to group under this head. On principle they seem to be mostly reducible to failure of the acceptance to correspond with the offer, or absence of any real consideration for the promise. In such cases, whether there be fraud or not, no contract is ever formed, and therefore there is nothing which can be ratified—a distinction which may have important effects. Relief against mistake is given where parties who have really agreed, or rather their advisers, fail to express their intention correctly. Here, if the original true intention is fully proved—as to which the court is rightly cautious—the faulty document can be judicially rectified.

*Disability.*

By the common law an infant (*i.e.*, a person less than twenty-one years old) was bound by contracts made for "necessaries," *i.e.*, such commodities as a jury holds, and the court thinks they may reasonably hold, suitable and required for the person's condition; also by contracts otherwise clearly for his benefit; all other contracts he might confirm or avoid after coming of age. An extremely ill-drawn Act of 1874 absolutely deprived infants of the power of contracting loans, contracting for the supply of goods other than necessaries, and stating an account so as to bind themselves; it also disabled them from binding themselves by ratification. The liability for necessaries is now declared by legislative authority in the Sale of Goods Act, 1893. Practically, people who give credit to an infant do so at their peril, except in cases of obvious urgency.

Married women were incapable by the common law of contracting in their own names. At this day they can hold separate property and bind themselves to the extent of that property—not personally—by contract. The law before the Married Women's Property Acts (1882 and 1893, and earlier Acts now superseded and repealed) was a very peculiar creature of the Court of Chancery; the number of cases in which it is necessary to go back to it is of course decreasing year by year. But a married woman can still be restrained from anticipating the income of her separate property, and the restriction is still commonly inserted in marriage settlements.

There is a great deal of philosophical interest about the nature and capacities of corporations, but for modern practical purposes it may be said that the legal powers of British corporations are directly or indirectly determined by Acts of Parliament. For companies under the Companies Acts the controlling instrument or written constitution is the memorandum of association. Company draftsmen, taught by experience, nowadays frame this in the most comprehensive terms. Questions of either personal or corporate disability are less frequent than they were. In any case, they stand apart from the general principles which characterize our law of contract.

HOLMES (afterwards Chief Justice of Massachusetts), *The Common Law*, Boston, Mass., 1881, is illuminating on contract as on other legal topics, though the present writer cannot accept all the learned judge's historical conjectures.

(F. Po.)

**Conveyancing** is the art or science of effecting the transfer of property, or modifying interests in relation to property, by means of written documents.

*History.*

In early legal systems the main element in the transfer of property was the change, generally accompanied by some public ceremony, in the actual physical possession: the function of documents, where used, being merely the preservation of evidence. Thus, in Great Britain in the feudal period, the common mode of conveying an immediate freehold was by *feoffment with livery of seisin*—a proceeding in which the transferee was publicly invested with the feudal possession or *seisin*, usually through the medium of some symbolic act performed in

the presence of witnesses upon the land itself. A deed or charter of feoffment was commonly executed at the same time by way of record, but formed no essential part of the conveyance. In the language of the old rule of the common law, the immediate freehold in corporeal hereditaments lay in livery, whereas reversions and remainders and all incorporeal hereditaments lay in grant, *i.e.*, passed by the delivery of the deed of conveyance or grant without any further ceremony. The process by which this distinction was broken down and the present uniform system of private conveyancing by simple deed was established, constitutes a long chapter in English legal history.

The land of a feudal owner was subject to the risk of forfeiture for treason, and to military and other burdens. The common law did not allow him to dispose of it by will. By the law of mortmain religious houses were prohibited from acquiring it. The desire to escape from these burdens and limitations gave rise to the practice of making feoffments to the *use* of, or upon trust for, persons other than those to whom the seisin or legal possession was delivered. The common law recognized only the legal tenant; but the *cestui que use* or beneficial owner gradually secured for his wishes and directions concerning the profits of the land the strong protection of the chancellors as exercising the equitable jurisdiction of the king. The resulting loss to the Crown and the great lords of the feudal dues and privileges, coupled with the public disadvantages arising from ownership of land which, in an increasing degree, was merely nominal, brought about the passing in the year 1535 of the famous Statute of Uses, the object of which was to destroy altogether the system of uses and equitable estates It enacted, in substance, that whoever should have a use or trust in any hereditaments should be deemed to have the legal seisin, estate, and possession for the same interest that he had in the use; in other words, that he should become in effect the feudal tenant without actual delivery of possession to him by the actual feoffee to uses or trustee. In its result the statute was a fiasco. It was solemnly decided that the Act transferred the legal possession to the use once only, and that in the case of a conveyance to A to the use of B to the use of or upon trust for C, it gave the legal estate to B, and left C with an interest in the position of the use before the statute. Thus was completed the foundation of the modern system of trusts fastened upon legal estates and protected by the equitable doctrines and practice of the judicature.

But the statute not only failed to abolish uses: it also opened the way to the evasion of the public ceremony of "livery of seisin," and the avoidance of all notoriety in conveyances. Other ways, besides an actual feoffment to uses, of creating a use had been in vogue before the statute. If A bargained with B, in writing or not, for the sale of land, and B paid the price, but A remained in legal possession, the Court of Chancery enforced the use or equitable interest in favour of B. The effect of a "bargain and sale" (as such a transaction was called) after the statute was to give B the legal interest without any "livery of seisin." This fresh danger was met in the very year of the statute itself by an enactment that a bargain and sale of an estate of inheritance or freehold should be made by deed publicly enrolled. But the Statute of Enrolments was in terms limited to estates of freehold. It was allowed that a bargain and sale for a term, say, of one year, must transfer the seisin to the bargainee without enrolment. And since what remained in the bargainor was merely a reversion which "lay in grant," it was an easy matter to release this by deed the day after. By this ingenious device was the publicity of feoffment or enrolment avoided, and the lease and release, as the process was called, remained the usual mode of conveying a freehold in possession down to the 19th century.

It was not until 1845 that the modern system of transfer by a single deed was finally established. By the Real Property Act of that year it was enacted that all corporeal hereditaments should, as regards the immediate freehold, be deemed to lie in grant as well as in livery. Since this Act the ancient modes of conveyance, though not abolished by it, have in practice become obsolete. Traces of the old learning connected with them remain, however, embedded in the modern conveyance. Many a purchase-deed recites that the vendor is *seised* in fee-simple of the property. It is the practice, moreover, to convey not only "to" but also "to the use of" a purchaser. For before the Statute of Uses, a conveyance made without any consideration or declaration of uses was deemed to be made to the use of the party conveying. In view of the operation of the statute upon the legal estate in such circumstances, it is usual in all conveyances, whether for value or not, to declare a use in favour of the party to whom the grant is made.

In its popular usage the word "conveyance" signifies the document employed to carry out a purchase of land. But the term "conveyancing" is of much wider import, and comprises the preparation and completion of all kinds of legal instruments. A well-known branch of the conveyancer's business is the investigation of title—an important function in the case of purchases or mortgages of real estate. With personal estate (other than leasehold) he has perhaps not so much concern. Chattels are usually transferred by delivery, and stocks or shares by means of printed instruments which can be bought at a law-stationer's. The common settlements and wills, however, deal wholly or mainly with personal property; and an interest in settled personalty is frequently the subject of a mortgage. Of late years, also, there has been an enormous increase in the volume of conveyancing business in connexion with limited joint-stock companies.

In the preparation of legal documents the practitioner is much assisted by the use of *precedents*. These are outlines or models of instruments of all kinds, exhibiting in accepted legal phraseology their usual form and contents with additions and variations adapted to particular circumstances. Collections of them have been in use from early times, certainly since printing became common. The modern precedent is, upon the whole, concise and businesslike. The prolixity which formerly characterized most legal documents has largely disappeared, mainly through the operation of recent statutes which enable many clauses previously inserted at great length to be, in some cases, *e.g.*, covenants for title, incorporated by the use of a few prescribed words, and in others safely omitted altogether. The Solicitors' Remuneration Act, 1881, has also assisted the process of curtailment, for there is now little or no connexion between the length of a deed and the cost of its preparation. So long as the draftsman adheres to recognized legal phraseology and to the well-settled methods of carrying out legal operations, there is no reason why modern instruments should not be made as terse and businesslike as possible.

***Contracts for sale.***

It is not usual for land to be sold without a formal agreement in writing being entered into. This precaution is due, partly to the Statute of Frauds (§ 4), which renders a contract for the sale of land unenforceable by action "unless the agreement upon which such action shall be brought, or some memorandum or note thereof, shall be in writing and signed by the party to be charged therewith or some other person thereunto by him lawfully authorized," and partly to the fact that there are few titles which can with prudence be exposed to all the requisitions that a purchaser under an "open contract" is entitled by law to make. Such a purchaser may, for example, require a forty years' title (Vendor and Purchaser Act, 1874). Under an open contract a vendor is presumed to be selling the fee-simple in possession, free from any incumbrance, or liability, or restriction as to user or otherwise; and if he cannot deduce a title of the statutory length, or procure an incumbrance or restriction to be removed, the purchaser may repudiate the contract. The preparation of an agreement for sale involves accordingly an examination of the vendor's title, and the exercise of skill and judgment in deciding how the vendor may be protected against trouble and expense without prejudice to the sale. Upon a sale by auction the agreement is made up of (1) the particulars, which describe the property; (2) the conditions of sale, which state the terms upon which it is offered; and

(3) the memorandum or formal contract at the foot of the conditions, which incorporates by reference the particulars and conditions, names or sufficiently refers to the vendor, and is signed by the purchaser after the sale. The object of the agreement, whether the sale is by private contract or by auction, is to define accurately what is sold, to provide for the length of title and the evidence in support of or in connexion with the title which is to be required except so far as it is intended that the general law shall regulate the rights of the parties, and to fix the times at which the principal steps in the transaction are to be taken. It is also usual to provide for the payment of interest at a prescribed rate upon the purchase money if the completion shall be delayed beyond the day fixed for any cause other than the vendor's wilful default, and also that the vendor shall be at liberty to rescind the contract without paying costs or compensation if the purchaser insists upon any requisition or objection which the vendor is unable or, upon the ground of expense or other reasonable ground, is unwilling to comply with or remove. Upon a sale by auction it is the rule to require a deposit to be paid by way of security to the vendor against default on the part of the purchaser.

*Abstract of title.*

The signature of the agreement is followed by the delivery to the purchaser or his solicitor of the abstract of title, which is an epitome of the various instruments and events under and in consequence of which the vendor derives his title. A purchaser is entitled to an abstract at the vendor's expense unless otherwise stipulated. It begins with the instrument fixed by the contract for the commencement of the title, or, if there has been no agreement upon the subject, with an instrument of such character and date as is prescribed by the law in the absence of stipulation between the parties. From its commencement as so determined the abstract, if properly prepared, shows the history of the title down to the sale; every instrument, marriage, birth, death, or other fact or event constituting a link in the chain of title, being sufficiently set forth in its proper order. The next step is the verification of the abstract on the purchaser's behalf by a comparison of it with the originals of the deeds, the probates of the wills, and office copies of the instruments of record through which the title is traced. The vendor is bound to produce the original documents, except such as are of record or have been lost or destroyed, but, unless otherwise stipulated, the expense of producing those which are not in his possession falls upon the purchaser (C. A., 1881). After being thus verified, the abstract is perused by the purchaser's advisers with the object of seeing whether a title to the property sold is deduced according to the contract, and what evidence, information, or objection, in respect of matters appearing or arising upon the abstract, ought to be called for or taken. For this purpose it is necessary to consider the legal effect of the abstracted instruments, whether they have been properly completed, whether incumbrances, adverse interests, defects, liabilities in respect of duties, or any other burdens or restrictions disclosed by the abstract, have been already got rid of or satisfied, or remain to be dealt with before the completion of the sale. The result of the consideration of these matters is embodied in "requisitions upon title," which are delivered to the vendor's solicitors within a time usually fixed for the purpose by the contract. In making or insisting upon requisitions regard is had, among other things, to any special conditions in the contract dealing with points as to which evidence or objection might otherwise have been required or taken, and to a variety of provisions contained in the V. and P. Act, 1874, and the Conveyancing Act, 1881, which apply, except so far as otherwise agreed, and of which the following are the most important: (1) Recitals, statements, and descriptions of facts, matters, and parties contained in instruments twenty years old at the date of the contract are, unless proved inaccurate, to be taken as sufficient evidence of the truth of such facts, matters, and descriptions; (2) a purchaser cannot require the production of, or make any requisition or objection in respect of, any document dated before the commencement of the title, (3) the cost of obtaining evidence and information not in the vendor's possession must be borne by the purchaser. The possibility of the rescission clause now commonly found in contracts for the sale of real estate being exercised in order to avoid compliance with an onerous requisition, is also an important factor in the situation. The requisitions are in due course replied to, and further requisitions may arise out of the answers. A summary method of obtaining a judicial determination of questions connected with the contract, but not affecting its validity, is provided by the V. and P. Act, 1874. Before completion it is usual for the purchaser to cause searches to be made in various official registers for matters required to be entered therein, such as judgments, land charges, and pending actions, which may affect the vendor's title to sell, or amount to an incumbrance upon the property.

*Requisitions.*

*Conveyances.*

When the title has been approved, or so soon as it appears reasonably certain that it will be accepted, the draft conveyance is prepared and submitted to the vendor. This is commonly done by and at the expense of the purchaser, who is entitled to determine the form of the conveyance, provided that the vendor is not thereby prejudiced, or put to additional expense. The common mode of conveying a freehold is now, as already mentioned, by ordinary deed, called in this case *an indenture*, from the old practice, where a deed was made between two or more parties, of writing copies upon the same parchment and then dividing it by an indented or toothed line. Indenting is, however, not necessary, and in modern practice is disused. A deed derives its efficacy from its being sealed and delivered. It is still a matter of doubt whether signing is essential. It is not necessary that its execution should be attested except in special circumstances, as, *e.g.*, where made under a power requiring the instrument exercising it to be attested. But in practice conveyances are not only sealed, but also signed, and attested by one or two witnesses. The details of a conveyance in any particular case depend upon the subject-matter and terms of the sale, and the state of the title as appearing by the abstract. The framework, however, of an ordinary purchase-deed consists of (1) the date and parties, (2) the recitals, (3) the testatum or witnessing-part, containing the statement of the consideration for the sale, the words incorporating covenants for title, and the operative words, (4) the parcels or description of the property, (5) the habendum, showing the estate or interest to be taken by the purchaser, and (6) any provisos or covenants that may be required. A few words will illustrate the object and effect of these component parts.

(1) The parties are the persons from whom the property, or some estate or interest in or in relation to it, is to pass to the purchaser, or whose concurrence is rendered necessary by the state of the title in order to give the purchaser the full benefit of his contract and to complete it according to law. It is often necessary that other persons besides the actual vendor should join in the conveyance, *e.g.*, a mortgagee who is to be paid off and convey his estate, a trustee of an outstanding legal estate, a person entitled to some charge or restriction who is to release it, or trustees who are to receive the purchase-money where a limited owner is selling under a power (*e.g.*, a tenant for life

under the power given by the Settled Land Act, 1882). Parties are described by their names, addresses, and occupations or titles, each person with a separate interest, or filling a distinct character, being of a separate part. (2) The recitals explain the circumstances of the title, the interests of the parties in relation to the property, and the agreement or object intended to be carried into effect by the conveyance. Where the sale is by an absolute owner there is no need for recitals, and they are frequently dispensed with; but where there are several parties occupying different positions, recitals in chronological order of the instruments and facts giving rise to their connexion with the property are generally necessary in order to make the deed intelligible. (3) It is usual to mention the consideration. Where it consists of money the statement of its payment is followed by an acknowledgment, in a parenthesis, of its receipt, which, in deeds executed since the C. A., 1881, dispenses with any endorsed or further receipt. A vendor, who is the absolute beneficial owner, now conveys expressly "as beneficial owner," which words, by virtue of the C. A., 1881, imply covenants by him with the purchaser that he has a right to convey, for quiet enjoyment, freedom from incumbrances, and for further assurance—limited, however, to the acts and defaults of the covenantor and those through whom he derives his title otherwise than by purchase for value. A trustee or an incumbrancer joining in the deed conveys "as trustee" or "as mortgagee," by which words covenants are implied that the covenantor individually has not done or suffered anything to incumber the property, or prevent him from conveying as expressed. As to the operative words, any expression showing an intention to pass the estate is effectual. Since the C. A., 1881, "convey" has become as common as "grant," which was formerly used. (4) The property may be described either in the body of the deed or in a schedule, or compendiously in the one and in detail in the other. In any case it is usual to annex a plan. Different kinds of property have their appropriate technical words of description. *Hereditaments* is the most comprehensive term, and is generally used either alone or in conjunction with other words more specifically descriptive of the property conveyed. (5) The habendum begins with the words "to hold," and the estate, on a sale in fee-simple, is limited, as already mentioned, not only *to*, but also *to the use of*, the purchaser. Before the C. A., 1881, it was necessary to add, after the name of the purchaser, the words "and his heirs," or "his heirs and assigns," though the word "assigns" never had any conveyancing force. But since that Act it is sufficient to add "in fee-simple" without using the word "heirs." Unless, however, one or other of these additions is made, the purchaser will even now get only an estate for his life. If the property is to be held subject to a lease or incumbrance, or is released by the deed from an incumbrance previously existing, this is expressed after the words of limitation (6) Where any special covenants or provisions have been stipulated for, or are required in the circumstances of the title, they are, as a rule, inserted at the end of the conveyance. In simple cases none are needed. Where, however, a vendor retains documents of title, which he is entitled to do where he sells a part only of the estate to which they relate, it is the practice for him by the conveyance to acknowledge the right of the purchaser to production and delivery of copies of such of them as are not instruments of record like wills or orders of Court, and to undertake for their safe custody. This acknowledgment and undertaking supply the place of the lengthy covenants to the like effect which were usual before the C. A., 1881. A trustee or mortgagee joining gives an acknowledgment as to documents retained by him, but not an undertaking. The foregoing outline of a conveyance will be illustrated by the following specimen of a simple purchase-deed of part of an estate belonging to an absolute owner in fee:—

THIS INDENTURE made the day of between A. B. of, &c., of the one part and C. D. of, &c., of the other part WHEREAS the said A. B. is seised (among other hereditaments) of the messuage hereinafter described and hereby conveyed for an estate in fee simple in possession free from incumbrances and has agreed to sell the same to the said C. D. for £100 NOW THIS INDENTURE WITNESSETH that in pursuance of the said agreement and in consideration of the sum of £100 paid to the said A. B. by the said C. D. (the receipt whereof the said A. B. doth hereby acknowledge) the said A. B. as beneficial owner doth hereby convey unto the said C. D. ALL THAT messuage or tenement situate &c., and known as, &c. TO HOLD the premises unto and to the use of the said C. D. his heirs and assigns [*or* in fee simple] And the said A. B. doth hereby acknowledge the right of the said C. D. to production and delivery of copies of the following documents of title [*mentioning them*] and doth undertake for the safe custody thereof IN WITNESS, &c.

It will be observed that throughout the deed there are no stops, the commencement of the several parts being indicated by capital letters. The draft conveyance having been approved on behalf of the vendor, it is engrossed upon stout paper or parchment, and there remains only the completion of the sale, which usually takes place at the office of the vendor's solicitor. A purchaser is not entitled to require the vendor to attend personally and execute the conveyance in his presence or that of his solicitor. The practice is for the deed to be previously executed by the vendor and delivered to his solicitor, and for the solicitor to receive the purchase-money on his client's behalf, since a purchaser is, under the C. A., 1881, safe in paying the purchase-money to a solicitor producing a deed so executed, when it contains the usual acknowledgment by the vendor of the receipt of the money. Upon the completion, the documents of title are handed over except in the case above referred to, and any claims between the parties in respect of interest upon the purchase-money, apportioned outgoings, or otherwise, are settled. The conveyance is, of course, delivered to the purchaser, upon whom rests the obligation of affixing the proper stamp—which he may do without penalty within thirty days after execution (Stamp Act, 1891). It may be added that, subject to any special bargain, which is rarely made, the costs of the execution by the vendor and other parties whose concurrence is necessary, and of any act required to be done by the vendor to carry out his contract, are borne by the vendor.

*Leases.*

Ordinary leases at rack-rents are not generally preceded by a formal agreement, such as is common on a sale of land, or by an investigation into the lessor's title. As a rule, the principal terms are arranged between the parties, and embodied with various ancillary provisions in a draft lease, which is prepared by the lessor's advisers and submitted to the lessee, the ultimate form and contents of the instrument being adjusted by negotiation. If an intending lessee desires to examine the title he must make an express bargain to that effect, for under a contract to grant a lease the intended lessee is not entitled, in the absence of such express stipulation, to call for the title to the freehold (V. and P. Act, 1874). By the Statute of Frauds all leases, except leases for a term not exceeding three years, and at not less than two-thirds of the rack-rent, were required to be in writing. And now by the Real Property Act, 1845, leases required by law to be in writing are void *at law* unless made by deed. An instrument, void as a lease under the Act, may, however, be valid as an agreement to take a lease; and since the Judicature Act, 1873, under which equitable doctrines prevail in the High Court, a person holding under an agree-

ment for a lease, of which specific performance would be granted, is treated in all branches of that court as if such a lease were already executed. Unless otherwise agreed, a lease is always prepared by a lessor's solicitor at the expense of the lessee; but the cost of the counterpart (*i.e.*, the duplicate executed by the lessee) is usually borne by the lessor.

*Assignment of leaseholds.*

Upon the sale and conveyance of a leasehold property substantially the same procedure is observed as above indicated in the case of a freehold. A few additional points, however, may be specially mentioned. Under an open contract the vendor cannot be called upon to show the title to the freehold reversion (V. and P. Act, 1874; C. A., 1881). Accordingly, the abstract of title begins with the lease, however old; but the subsequent title need not be carried back for more than forty years before the sale. The purchaser, apart from stipulation, must assume, unless the contrary appears, that the lease was duly granted, and upon production of the receipt for the last payment due for rent before completion, that all the covenants and provisions of the lease have been duly performed and observed up to the date of actual completion. The appropriate word of conveyance is "assign," and a conveyance of leaseholds is generally called an assignment. The vendor's covenants for title implied by his assigning "as beneficial owner" include, in addition to the covenants implied by those words in a conveyance of freehold, a covenant limited in manner above mentioned, that the lease is valid, and that the rent and the provisions of the lease have been paid and observed up to the time of conveyance (C. A., 1881). Where the vendor, as is the common case, remains liable after the assignment for the rent and the performance of the covenants, the purchaser must covenant to pay the rent, and perform and observe the covenants and provisions of the lease, and keep the vendor indemnified in those respects.

*Mortgages.*

A mortgage is prepared by the solicitor of the mortgagee, and the mortgagor bears the whole expenses of the transaction. It is seldom that there is any preliminary agreement, because (1) a contract to lend money is not specifically enforceable; and (2) inasmuch as the primary object of a mortgagee is to have his money well secured, he is not, generally, willing to submit to restrictions as to title or evidence of title which might give rise to difficulty or expense in the event of a sale of the mortgaged property. An intending mortgagor is accordingly required to show a title easily marketable, and to verify it at his own cost. A mortgage follows the same general form as a conveyance on sale, the principal points of difference being that the conveyance of the property is preceded by a covenant for the payment of the mortgage money and interest, and followed by a proviso for reconveyance upon such payment, and by any special provisions necessary or proper in the circumstances, such as a covenant for insurance and repairs where the security comprises buildings. The covenants for title implied by a mortgagor conveying "as beneficial owner" are the same as in the case of a vendor, but they are absolute and not qualified in the manner above pointed out.

The beneficial operation of the C. A., 1881, in shortening conveyances is well illustrated by a modern mortgage. For, by virtue of the Act, a mortgagee by deed executed after its commencement has, subject to any contrary provisions contained in the deed, the following powers to the like extent as if they had been conferred in terms: (1) a power of sale exercisable after the mortgage money has become due (*a*) if notice requiring payment has been served and not complied with for three months; (*b*) if any interest is in arrear for two months; or (*c*) there has been a breach of some obligation under the deed or the Act other than the covenant for payment of the mortgage money or interest; (2) a power to insure subject to certain restrictions; (3) a power, when entitled to sell, to appoint a receiver; and (4) a power while in possession to cut and sell timber. The Act contains ancillary provisions enabling a mortgagee upon a sale to convey the property for such estate or interest as is the subject of the mortgage, and to give a valid receipt for the purchase-money, and the purchaser is amply protected against any irregularities of which he had no notice. There are also large powers of leasing conferred by the Act upon mortgagor and mortgagee while respectively in possession, and a power for the mortgagor, whilst entitled to redeem, to inspect and take copies of title deeds in the mortgagee's possession. The elaborate provisions for all these purposes which were formerly inserted in mortgage deeds are now omitted; but sometimes the operation of the Act is modified in certain respects. The procedure upon a sale by a mortgagee is the same as in the case of any other vendor. He conveys, however, "as mortgagee," these words implying only a covenant by him against incumbrances arising from his own acts.

*Settlements.*

The frame of a strict settlement of real estate, which is usually made either on marriage or by way of resettlement on a tenant in tail under an existing settlement attaining twenty-one, has been much simplified; but such settlements still remain the most technical and most complicated of legal instruments. By virtue of the Settled Land Acts, 1882 to 1890, tenants for life and many other limited owners have extensive powers of sale, of leasing, and of doing numerous other acts required in a due course of management. These powers cannot be excluded or fettered by settlors. They are, as a rule, considered in practice to be sufficient, and the corresponding elaborate provisions formerly inserted in settlements are now omitted, the operation of the Acts being merely supplemented, where desirable, by some extension of the statutory powers, in relation, *e.g.*, to the investment and application of capital money. To complete the statutory machinery it is desirable that persons should be nominated by the settlement trustees for the purposes of the Acts. Since the C. A., 1881, provisions for the protection of jointresses or persons entitled under settlements to rent charges or annual sums issuing out of the land are no longer required, as all such persons have now powers of distress and entry, and of limiting terms to secure their respective interests. Terms for raising portions must still, however, be expressly created. The C. A., 1881, also confers large powers of management during the minorities of infants beneficially entitled upon persons either appointed for the purpose by the instrument or being such trustees as are mentioned in § 42. An estate in tail may now be limited by the use of the words "in tail" without the words "heirs of the body" formerly necessary. And a settlor generally conveys "as settlor," by which only a covenant for further assurance is implied under the C. A., 1881. Personal settlements are most often made upon marriage. The settled property is vested in trustees, either by the settlement itself, or in the case of cash, mortgage debts, stocks or shares, by previous delivery or transfer, upon trusts declared by the instrument.

The normal trusts after the marriage are (1) for investment; (2) for payment of the income of the husband's property to him for life, and of the wife's property to her for life for her separate use without power of anticipation whilst under coverture; (3) for payment to the survivor for his or her life of the income of both properties; (4) after the death of the survivor, both as to capital and income, for the issue of the marriage as the husband and wife shall jointly by deed appoint, and in default of joint appointment as the survivor shall by deed or will appoint, and in default of such appointment for the children of the marriage who attain twenty-one or being daughters marry, in equal shares, with the addition of a clause (called the hotchpot clause) precluding a child who or whose issue takes a part of the fund by appointment from sharing in the unappointed part without bringing the appointed share into account. Then follows a power for the trustees with the consent of the parents whilst respectively living to raise a part (usually a half) of the share of a child and apply it for his or her advancement or benefit. Power to apply income, after the death of the life tenants, for the maintenance and education of infants entitled in expectancy, is conferred upon trustees by the C. A., 1881. The ultimate trusts in the event of there being no children who attain vested interests are (1) of the husband's property for him

absolutely; and (2) of the wife's property for such persons as she shall when discovert by deed, or whether covert or discovert by will, appoint, and in default of appointment, for her absolutely if she survive the husband, but if not, then for her next of kin under the Statute of Distributions, excluding the husband. For all ordinary purposes the trustees have now under various statutes sufficient powers and indemnities. They may, however, in some cases need special protection against liability. A power of appointing new trustees is supplied by the Trustee Act, 1893. It is usually made exercisable by the husband and wife during their joint lives, and by the survivor during his or her life.

**Wills.** The form and contents of wills are extremely diverse. A will of, perhaps, the commonest type (*a*) appoints executors and trustees; (*b*) makes a specific disposition of a freehold or leasehold residence; (*c*) gives a few legacies or annuities; and (*d*) devises and bequeaths to the executors and trustees the residue of the real and personal estate upon trust to sell and convert, to invest the proceeds (after payment of debts and funeral and testamentary expenses) in a specified manner, to pay the income of the investments to the testator's widow for life or until another marriage, and subject to her interest, to hold the capital and income in trust for his children who attain twenty-one, or being daughters marry, in equal shares, with a power of advancement. Daughters' shares are frequently settled by testators upon them and their issue on the same lines and with the same statutory incidents as above mentioned in the observations upon settlements; and sometimes a will contains in like manner a strict settlement of real estate. It is a point often overlooked by testators desirous of benefiting remote descendants that future interests in property must, under what is known as the rule against perpetuities, be restricted within a life or lives in being and twenty-one years afterwards. In disposing of real estate "devise" is the appropriate word of conveyance, and of personal estate "bequeath." But neither word is at all necessary. "I leave all I have to A. B. and appoint him my executor" would make an effectual will for a testator who wished to give all his property, whether real or personal, after payment of his debts, to a single person. By virtue of the Land Transfer Act, 1897, Part I., real estate of an owner dying after 1897 now vests for administrative purposes in his executors or administrators, notwithstanding any testamentary disposition.

It remains to mention that by the Land Transfer Act, 1897, a system of compulsory registration of title, limited for the present to the county of London, has been established. (See LAND REGISTRATION.)

*United States.*—Conveyances of real estate in the United States are simple in form, and are often prepared by those who have had no professional training for the purpose. Printed blanks, sold at the law-stationers, are commonly employed. The lawyers in each state have devised forms for such blanks, sometimes peculiar in some points to the particular state, and sometimes copied verbatim from those in use elsewhere. Deeds intended to convey an absolute estate are generally either of the form known as *warranty deed* or of that known as *release deed*. The release deed is often used as a primary conveyance without warranty to one who had no prior interest in the land. Uniformity in deeds is rendered particularly desirable from the general prevalence of the system of recording all conveyances at length in a public office. Record books are printed for this purpose, containing printed pages corresponding to the printed blanks in use in the particular state, and the recording officer simply has to fill up each page as the deed of similar form was filled up. One set of books may thus be kept for recording warranty deeds, another for recording release deeds, another for recording mortgage deeds, another for leases, &c.

(S. WA.; S. E. B.)

**Conway** (or ABERCONWAY), a summer resort, municipal town, and parish in the county of Carnarvon, Wales, 14 miles by rail north-east from Bangor and 225 north-west from London. It is built on the side and at the foot of a hill (800 ft.) at the mouth of the river Conway, with Great Orme's Head and Llandudno 4 miles to the north. The river is crossed by two bridges—a tubular railway bridge, similar to that at Menai and only 40 feet shorter, built by Stephenson in 1846–48, and a handsome suspension bridge, designed by Telford and built of white stone, in keeping with the castle, in 1822–26. One of the old houses of the town, the Elizabethan Plas Mawr, is the headquarters of the Royal Cambrian Academy of Art. There are still a few fragments of the Cistercian abbey founded in 1185. The principal public buildings are the guildhall and the market hall; and there are a new bronze fountain, a convalescent home for children, and golf links. Area of the parish, 2437 acres; of the municipal borough, 3312 acres. Population of borough (1891), 3442; (1901), 4660. The river Conway, about 30 miles long, drains the beautiful Vale of Conway, in which stand Bettws-y-Coed, Llanrwst, and Trefriw, the last-named a favourite artists' haunt.

**Cooch** (or Kuch) **Behar,** a native state of India, in Bengal, a submontane tract, not far from Darjiling, entirely surrounded by British territory. Area, 1307 sq. m. Population (1881), 602,624; (1901), 567,037. The gross revenue in 1897–98 was Rs.22,39,668. The present Maharaja, Nripendra Narayan, G.C.I.E., was born in 1862 and educated under British guardianship at Patna and Calcutta. He is Hon. Lieutenant-Colonel of the 6th Bengal Cavalry. In 1897–98 he served in the Tirah campaign on the staff of General Yeatman-Biggs, and received the distinction of a C.B. In 1878 he married a daughter of Keshub Chundra Sen, the Brahmo leader. His eldest son has been educated in England. Among other improvements, a railway has been constructed, with the assistance of a loan from the British Government, for a length of 22 miles, which is now being extended for a farther 12 miles. The earthquake of 12th June 1897 caused damage to public buildings, roads, &c., in the state to the estimated amount of Rs.15,00,000.

The town of COOCH BEHAR is situated on the river Torsha, and has a railway station; population, 9535.

**Cook, Eliza** (1818–1889), English author, was born in 1818, in Southwark, being the daughter of a local tradesman. She was self-taught, and began when a girl to write poetry for such periodicals as the *Weekly Dispatch* and *New Monthly*. In 1840 she published *Melaia and other Poems*, and from 1849 to 1854 conducted a paper for the family called *Eliza Cook's Journal*. She also published *Jottings for my Journal* (1860), and *New Echoes* (1864); and in 1864 she was given a Civil List pension of £100 a year. As the author of a single poem, "The Old Armchair," Eliza Cook's name was for a generation after 1838 a household word both in England and in America, her kindly domestic sentiment making her a great favourite with the working-class and middle-class public. She died at Wimbledon, 25th September 1889.

**Cook, Thomas** (1808–1892), travelling agent, was born at Melbourne in Derbyshire on 22nd November 1808. Beginning work at the age of ten, he was successively a gardener's help and a wood-turner at Melbourne, and a printer at Loughborough. At the age of twenty he became a Bible-reader and village missionary for the county of Rutland; but in 1832, on his marriage, combined his wood-turning business with that occupation. In 1840 he became actively associated with the temperance movement, and printed at his own expense various publications in its interest, notably the *Children's Temperance Magazine*, the first of its kind to appear in England.

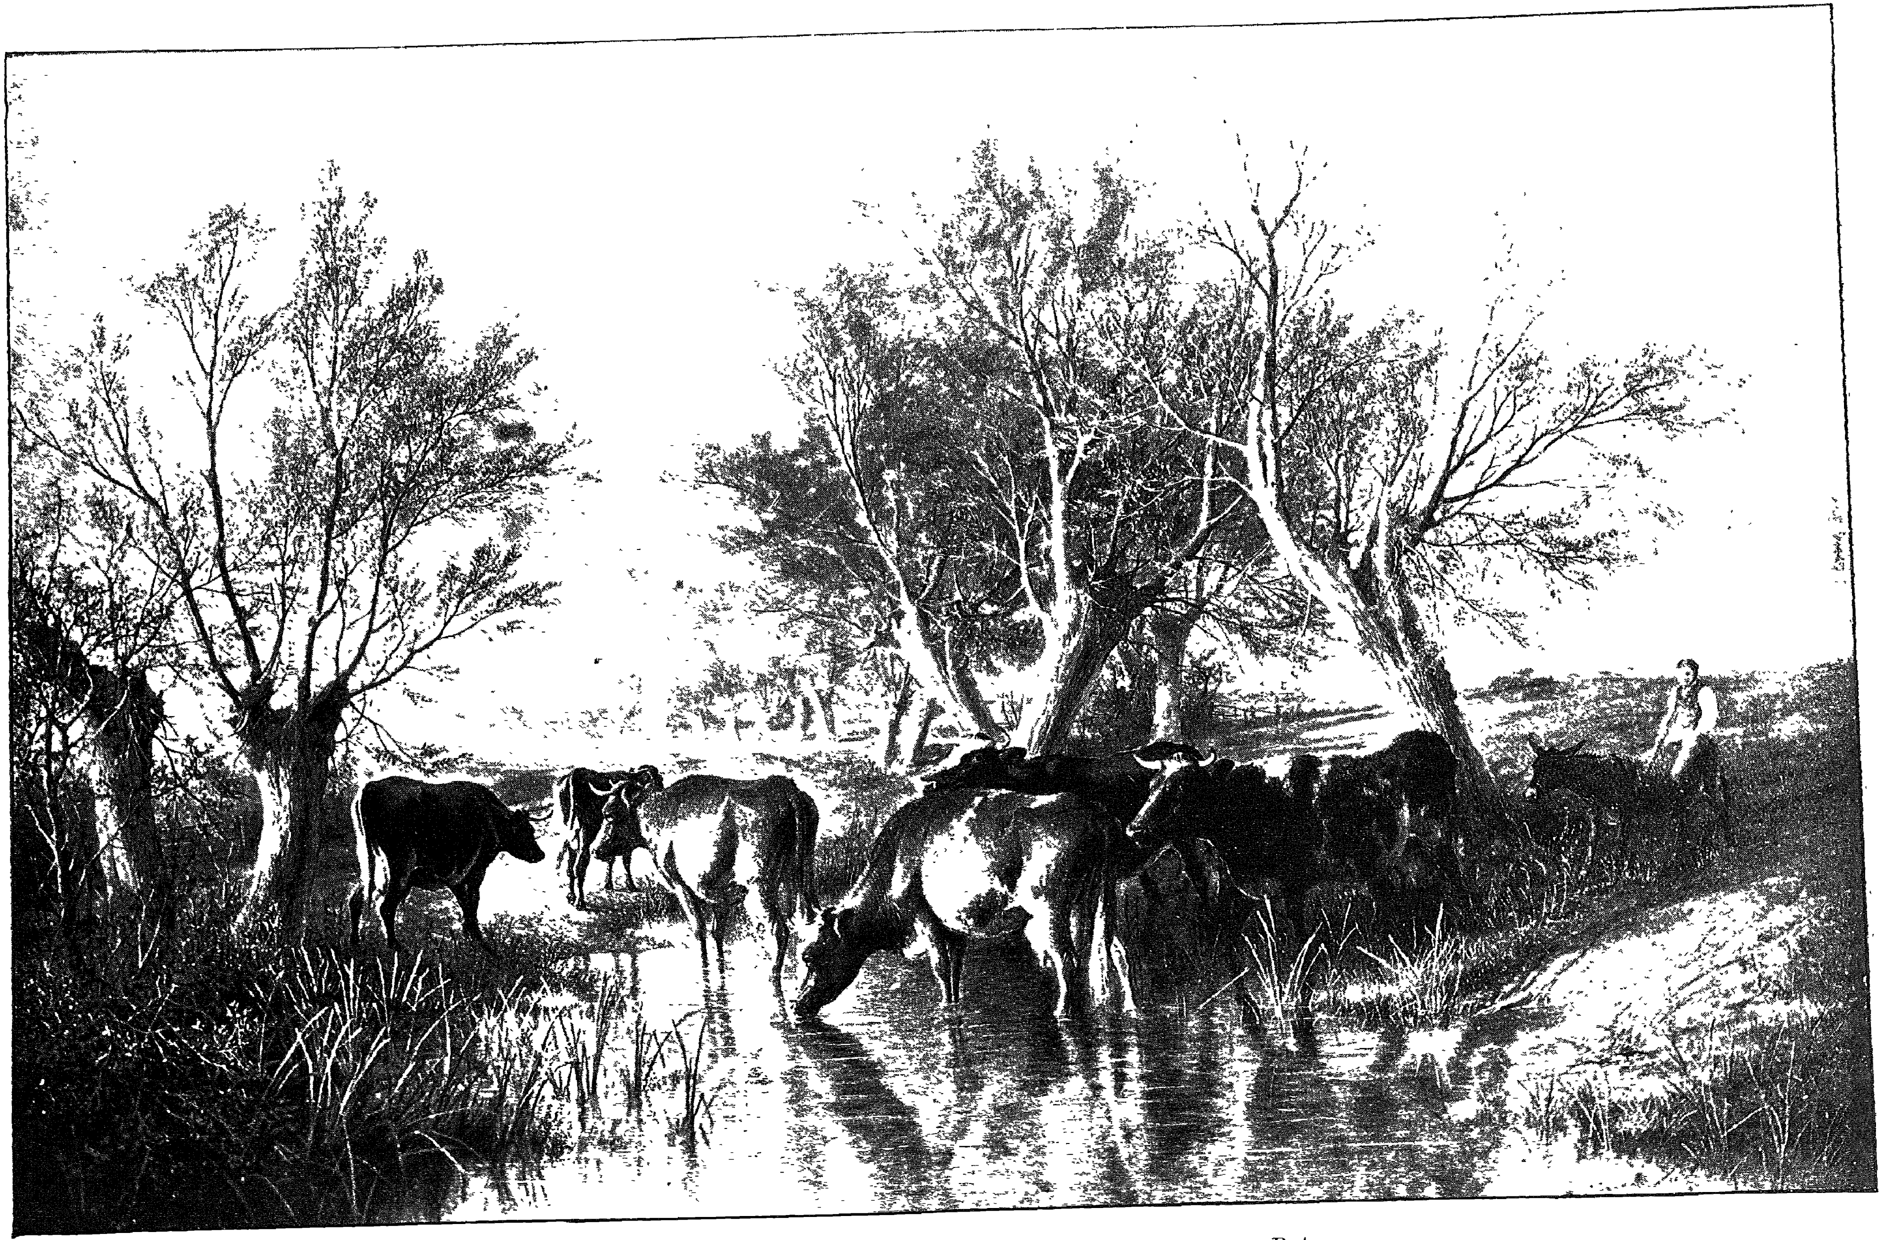
In June 1841 a large meeting was to be held at Loughborough in connexion with this movement, and Cook was struck with the idea of getting the railway company to run a special train from Leicester to the meeting. The company consented, and on 5th July there were carried 570 passengers from Leicester to Loughborough and back at a shilling a head. This is believed to be the first publicly-advertised excursion train ever run in England—private "specials," reserved for members of institutes and similar bodies, were already in use. The event caused great excitement, and Cook received so many applications to organize similar parties that he henceforward deserted wood-turning, while continuing his printing and publishing. The summers of the next three years were occupied with excursions like the first; but in 1845 Cook advertised a pleasure-trip on a more extensive scale, from Leicester to Liverpool and back, with opportunities for visiting the Isle of Man, Dublin, and Welsh coast. A *Handbook of the Trip to Liverpool* was supplied for the use of travellers. A trip to Scotland followed, and the excursionists were received in Glasgow with music and salute of guns. The next great impetus to popular travel was given by the Great Exhibition of 1851, which Cook helped 165,000 visitors to attend. On the occasion of the Paris exhibition of 1855 there was a Cook's excursion from Leicester to Calais and back for £1, 10s. The following year saw the first grand circular tour in Europe. This part of Cook's activity largely increased after 1863, when the Scottish railway managers broke off their engagements with him, and left him free for more distant enterprise. Switzerland was opened up in 1863, and Italy in 1864. Up to this time "Cook's tourists" had been personally conducted, but now he began to be an agent for the sale of English and foreign tickets, the holders of which travelled independently. Switzerland was the first foreign country accessible under these conditions, and in 1865 nearly the whole of Europe was included in the scheme. Its extension to the United States followed in 1866. For the benefit of visitors to the Paris exhibition, Cook made a fresh departure and leased a hotel there. In the same year began his system of "hotel-coupons," providing accommodation at a fixed charge. The year 1869 was marked by an extension of Cook's tours to Palestine, followed by further developments of travel in the East, his son, John Mason Cook, being appointed in 1870 agent of the Khedivial Government for passenger traffic on the Nile. The Franco-Prussian war of 1870–71 was expected to damage the tourist system, but, as a matter of fact, encouraged it, through the demand for combination, international tickets enabling travellers to reach the south of Europe without crossing the belligerent countries. At the termination of the war a party of American freemasons visited Paris under Mr J. M. Cook's guidance, and became the precursors of the present vast American tourist traffic. At the beginning of 1872 Mr J. M. Cook entered into formal partnership with his father, and the firm first took its well-known appellation of Thomas Cook and Son. In 1882, on the outbreak of Arabi Pasha's rebellion, Cook and Son were commissioned to convey Sir Garnet Wolseley and his suite to Egypt, and to transport the wounded and sick up the Nile by water, for which they received the thanks of the War Office. The firm was again employed in 1884 to convey General Gordon to the Sudan, and the whole of the men (18,000) and stores necessary for the expedition afterwards sent to relieve him. In 1889 Cook and Son acquired the exclusive right of carrying the mails, specie, soldiers, and officials of the Egyptian Government along the Nile. In 1891 the firm celebrated its jubilee, and on 19th July of the following year Thomas Cook died. He had been afflicted with blindness in his declining years. (J. M'F.)

**Cook** or **Hervey Islands,** a Polynesian archipelago lying about the Tropic of Capricorn, some 700 miles south by east of Samoa, mainly between 150°–160° E. long. It comprises ten partly volcanic, partly coralline, islands, the more important of which are *Rarotonga*, hilly, fertile, and well watered, with several cones 300 to 400 feet high, above which towers the majestic Rarotonga volcano (4000 feet), the culminating point of the archipelago; *Mangaia* (*Mangia*); *Aitaluki*, with luxuriant cocoanut palm groves; *Atui* (*Vatui*); *Mitiero; Mauki; Fenuaiti;* and the two *Hervey* islets, which give an alternative name to the group. The total area is 142 square miles, and the population in 1900 was 8400. Owing to its healthy, equable climate, the archipelago is well suited for European settlement; but the dangerous fringing coral reefs render it difficult of access, and it suffers also from the absence of good harbours. The natives, who are of Polynesian stock and speech, are nearly all Protestants, and since 1890 have enjoyed a general Legislature and an Executive Council, of which the *Arikis* ("Kings" and "Queens") are members. But all enactments are subject to the approval of the British Resident at Rarotonga, and a British Protectorate, proclaimed in 1888, was followed by the annexation of the whole archipelago by the Governor of New Zealand in November 1900.

**Cooktown,** a seaport in Queensland, Australia, in the county of Banks, at the mouth of the Endeavour river, about 1050 miles north-west of Brisbane. It is visited by the ocean steamers of several lines, and is the centre of a very extensive *bêche de mer* and pearl fishery. Tin and gold are worked in the district. The population in 1898 was estimated at 2560.

**Coolgardie,** a town in West Australia, about 310 miles by rail east by north of Perth and Freemantle, and 528 miles by rail north-east of Albany. Its goldfield, now considered a permanent one, was discovered in 1891. In course of time it will probably be connected with Esperance, the natural port of the goldfield, by railway. Its population was estimated in 1898 at 13,000; that of the goldfield at about 30,000.

**Cooper, Peter** (1791–1883), American manufacturer, inventor, and philanthropist, was born in New York on 12th February 1791. As a boy he worked with his father at hat-making, brewing, and brick-making, and had little opportunity for attending school. At the age of seventeen he was apprenticed to a carriage-builder. When he became of age he engaged in the manufacture of machines for shearing cloth, and during the war of 1812 his business was very profitable. Later he took up with success the manufacture of glue. About 1828 he erected the Canton Iron Works at Baltimore, Md., and in this enterprise laid the foundations of his fortune. In 1830 he designed and constructed the first locomotive built in America. He subsequently sold his works at Baltimore, and erected at Philippsburgh, Pa., the largest blast furnaces erected in America up to that time, and enlarged his enterprise by purchasing iron mines in the vicinity and building a railway to transport their ore to his furnaces. He was actively interested in the laying of the first Atlantic cable. His memory is perpetuated in the Cooper Union for the Advancement of Science and Art, which he founded in New York in 1854. This splendid institution is designed especially to furnish educational opportunities to the working classes. Its principal features are a free library and reading-room, lecture courses, and night and day classes. In the election of 1876 he was the candidate of the National Independent party for the presidency. He died in New York, 4th April 1883.



"Return to the Farm: Milking Time." By Sidney Cooper, R.A.

**Cooper, Thomas Sidney** (1803–1902), English painter, was born at Canterbury on 26th September 1803. In very early childhood he showed in many ways the strength of his artistic inclinations, but as the circumstances of his family did not admit of his receiving any systematic training, he began before he was twelve years old to work in the shop of a coach painter. A little later he obtained employment as a scene painter; and he alternated between these two occupations for about eight years. But the desire to become an artist continued to influence him, and all his spare moments were given up to drawing and painting from nature. At the age of twenty he went to London, drew for a while in the British Museum, and was admitted as a student of the Royal Academy. He then returned to Canterbury, where he was able to earn a living as a drawing-master and by the sale of sketches and drawings. In 1827 he settled in Brussels; but four years later he returned to London to live, and by showing his first picture at the Royal Academy (1833) began an unprecedentedly prolonged career as an exhibitor. Cooper's name is mainly associated with pictures of cattle or sheep, and the most notable of the many hundred he has produced are: "A Summer's Noon" (1836), "A Drover's Halt on the Fells" (1838), "A Group in the Meadows" (1845), "The Half-past One o'Clock Charge at Waterloo" (1847), "The Shepherd's Sabbath" (1866), "The Monarch of the Meadows" (1873), "Separated but not Divorced" (1874), "Isaac's Substitute" (1880), "Pushing off for Tilbury Fort" (1884), and "On a Farm in East Kent" (1889). He was elected an Associate of the Royal Academy in 1845, and a Royal Academician in 1867. He presented to his native place, in 1882, the Sidney Cooper Art Gallery, built on the site of the house in which he was born. He wrote his reminiscences, under the title of *My Life*, in 1890; and died on 7th February 1902.

**Co-operative Societies.**—The progress of co-operation, during the last twenty years of the 19th century, was very remarkable, both in the United Kingdom and abroad. Not only have the societies, in spite of numerous failures, greatly increased in number, membership, capital, and trade, but they have come into close relations, both commercial and for propaganda, with other co-operative societies in their own country and abroad; and finally an important International Co-operative Alliance has been formed for promoting mutual helpfulness and international trading relations.

The following figures show the growth of co-operation—that is to say, of working-class co-operation—in the United Kingdom:—

| | Societies. | Members. | Capital. | Business. |
|---|---|---|---|---|
| 1876 . . | 1113 | 493,189 | £5,742,297 [1] | £18,647,817 [1] |
| 1899 . . | 1858 | 1,675,998 | 28,267,398 | 75,422,895 |

Practically all these societies are registered with limited liability under the Industrial and Provident Societies Acts, their government is democratic, based on one vote for man or woman; and their members (or shareholders) and committeemen are almost exclusively the more provident of the working classes or belong to the class just above.

By far the greater part of these figures represent Workmen's Distributive Societies, or stores, flourishing chiefly in the North and Midlands of England and in Scotland, and numbering 1446, with 1,613,461 members, £22,294,624 capital, and sales of £45,047,446 in the year. The largest is that of Leeds, with 49,000 members and £1,500,000 sales. The shares in these societies are withdrawable in cash and not transferable. Their method is the "Rochdale system," now spread over the world, by which the twenty-eight poor weavers of Rochdale made co-operation, until then little but a dream and a series of failures, into a great practical success. A record is kept, by means of metal checks or otherwise, of each member's purchases; and at the end of each quarter, after payment of a fixed interest (never more than 5 per cent., and in very many societies less) on shares, and sometimes a proportion of profit to the employees, the surplus is divided to the members in proportion to their purchases. Thus they in effect obtain their necessaries at cost price. Not far from £7,000,000 is thus returned in the year, averaging nearly 2s. 8d. in the £ of purchases. In many successful societies an even higher dividend on purchases is paid, but the average prices of goods sold are often fixed above those current in the neighbourhood, so that the members, in addition to saving the retailer's profit, use their Society as a sort of savings bank, where they put away a halfpenny or so for every shilling they spend. In addition to retailing, a store often manufactures bread, clothes, boots, or flour, or farms land, usually for its own members only, but occasionally for sale to other societies also. Their productions in this way reach about £4,000,000 a year. They also invest large and increasing sums in building cottages to sell or let to their members; and they lend largely to their members to enable them to buy cottages.

***Distribution.***

Outwardly these stores may look like mere shops, but they are really much more. First, they are managed with a view not to a proprietor's profit but to cheap and good commodities. Secondly, they have done an immense work for thrift and the material prosperity of the working classes, and as teachers of business and self-government. But, further, they have a distinct social and economic aim, namely, to correct the present inequalities of wealth, and substitute for the competitive system an industry controlled by all in the common interest and distributing on principles of equity and reason, mutually agreed on, the wealth produced. With this view they acknowledge the duties of fair pay and good conditions for their own employees, and of not buying goods made under bad conditions. The best societies further set aside a small proportion of their profits for educational purposes, including concerts, social gatherings, classes, lectures, reading-rooms and libraries. They often make grants to causes with which they sympathize; and their members are often prominent in local government affairs, co-operative candidates being occasionally run for school-boards and town councils. Though the societies are non-political, they are usually centres of "progressive" ideas. There are of course many defects, and of their million and two-thirds members a large, and many fear an increasing, proportion, attracted by the prosperity of the societies, think chiefly of what they themselves gain; but the government of the movement has, hitherto at least, been largely in the hands of men of ideas who believe that stores are but a step to co-operative production and on to the "co-operative commonwealth."

***Aims.***

It is indeed only when we come to federations of co-operative societies, and above all to production, with its large number of employees, that the industrial and educational side of the movement is most seen. The Co-operative Union, Limited, for instance, is a propagandist federation of all the chief co-operative societies in Great Britain, and some in Ireland, which does a great amount of educational work. Its income is over £8000 a year; it looks after the legal and parliamentary interests of the societies, carries on much educational work by means of literature, lectures, classes, scholarships, summer meetings at the universities, and so on; organizes numerous local conferences for discussion, and once a year a great national Co-operative Congress and Exhibition of productions, in some chief centre of population. The Co-operative Wholesale Society, Limited, is a trading federation of nearly 1100 stores, which include over 1,300,000 individuals. Founded in 1863 on a small scale, in 1901 its capital was £3,314,887 and its employees about 11,000. Its sales in 1901 were estimated to reach £17,000,000. Besides its merchant trade, it manufactures to the value of £2,500,000, owning factories, warehouses, and land in many districts. It owns steamships and is a large importer, and is also the bank of the Co-operative Societies, and the chief outlet for the always redundant capital of the stores. The Scottish stores also have their Wholesale Society, not less important relatively. For many purposes these two societies are in partnership. Their net profits are returned to the stores as a dividend on purchases, and thence to the whole body of members. There are also smaller local federations of stores, mostly for corn-milling and baking.

***Production.***

Strongly contrasting with this production by associations of consumers, or "consumers' production," is the co-partnership or "Labour Co-partnership" branch of co-operation. The simplest form of such co-operation is an association of producers formed to carry on their own industry. Originally such associations were intended to consist solely of the workers employed, but membership is now open to the distributive societies, which are their chief customers, and usually to all sympathizers. Shares are transferable, not withdrawable. Profits first pay the agreed "wages of capital," and of what remains the main part goes to the employees as a dividend on their wages and to the customers as a dividend on their purchases. In well-established societies the dividends on wages average about 1s. on the £ of wages. This is not usually paid in cash, but credited to the employees as share capital, whereby all may become members. Besides other producers' associations,

***Co-partnership.***

[1] Figure not quite complete.

more or less co-operative, there were, at the end of 1900, 90 such co-partnership associations at work in England. Some of them are very small, while others have businesses of £40,000 a year or more; the majority show fair, sometimes large, profits. Each is governed by a committee, or directors, who are elected by the members and appoint a manager.

We constantly hear that co-operative production is a failure. There have no doubt been many failures, especially of big experiments attempted among men totally unprepared. But many of the failures counted were not truly co-operative. At the present day consumers' production is successful beyond all question, while the net growth of producers' associations in recent years has been marked both in number and importance. These two forms of production best illustrate the two rival theories which divide British co-operation, and between whose partisans the conflict has at times been sharp. The consumers' theory maintains that all profit on price is abstracted from the consumer and must be returned to him; while to him should also belong all capital and control, subject to such regulations as the State and the Trade Unions enforce. This theory is fully exemplified in the English Wholesale Society, and in one of the corn mills, which employ workmen, whether co-operators or not, for wages only and admit no individual, but only co-operative societies, to membership. It is also exemplified by the great majority of the stores, though in their case the employee may become a member in his capacity as a consumer. The co-partnership theory, on the other hand, maintains that the workers actually employed in any industry, whether distributive or productive, should be partners with those who find the capital, and those who buy the produce, and should share with them profit, responsibilities, and control. The consumers' party contend that societies of producers make a profit out of the consumers, and thus are never truly co-operative, while as they multiply they must compete against each other. The co-partnership party answer that labour at least helps to make the profit, and that competition, as yet almost insignificant between their societies, can be avoided by federating them (a process long ago begun) for buying and selling in common, and for other common purposes, while leaving each the control and responsibility of its own affairs. They further advocate the eventual federation of the productive wing of co-operation with the distributive wing for settling prices and all matters in which their interests might conflict. In this way they say the co-operative system may extend indefinitely without sacrificing either individual responsibility and freedom, or a general unity and control, so far as these are necessary to secure the common interest. On the other hand they hold that the opposing system tends more and more to centralization and bureaucracy, and divorces the individual workman from all personal interest in his work and from any control over its conditions. They contend, moreover, that, in spite of the great advantages consumers' production has in its command of a market and of abundant capital, only a small part of industry can ever be carried on by associations of the persons who actually consume the produce.

***Rival theories.***

On the working out of these two principles depends the future of co-operation. The example of Scotland probably throws light on the problem. There co-operative production, amounting in 1900 to £1,815,042, is nearly all carried on by federations of consumers' societies, including the Scottish Wholesale, applying more or less successfully the co-partnership principle—*i.e.*, their employees are admitted to share in profits, and may become members, whereby they are further admitted to share capital and control. The type of organization hence resulting is very much the same as where a society of producers admits consumers' societies to membership and sets aside a proportion of the profits to be returned to them as dividend upon their purchases. To this type, we have seen, English productive societies started by producers have come, and it would appear that those started by consumers must tend to it. Besides the societies already mentioned, the Irish co-operative dairies rank as co-partnership. The earliest and latest statistics of British and Irish co-operative productive societies, of whatever origin, accepting that principle are:—

| | 1883. | 1900. |
|---|---|---|
| Societies at work | 15 | 265 |
| Trade | £160,751 | £3,553,593 |
| Capital | £106,436 | £1,547,729 |
| Profits | £9,031 | £158,315 |
| Losses | £114 | £7,418 |
| Dividend on Wages | Unknown | £20,545 |

An association of co-operative societies and individuals, called the Labour Association, exists to maintain this principle of co-partnership in co-operative production and also promote its gradual adoption in businesses of a capitalistic character. Some progress in this latter direction is being made, there being a tendency to improve upon mere profit-sharing by capitalizing the workman's "bonus," whereby he becomes a shareholder, and the business is gradually modified in a co-operative direction. There are remarkable instances of such modification abroad, notably that of the great iron-foundry and "Familistère" at Guise in France; the most noteworthy in England is that of the South Metropolitan Gas Company. After only a few years of the system 3000 workers own shares worth over £103,000 besides £33,000 on deposit; they also elect two of themselves directors of the Company. Unfortunately this example is marred by a feud with the Trade Unions, whereas there is usually friendship and even alliance between Trade Unionism and co-partnership, and other, co-operative societies.

In Ireland stores have not hitherto flourished, though a few exist. Irish co-operation is agricultural, and dates from the foundation of one co-operative dairy in 1889. Thence has grown a movement already of great importance and rapidly advancing. In 1890 there was still only one such society, in 1891 there were 17, but on 31st December 1900 there were 412, of which 171 were dairies, 106 agricultural societies, and 76 banks. By August 1901 the societies numbered about 470, of which of course not all were yet at work, and the members about 54,000. To form a dairy the small working farmers of a district register a society and take up shares of £1 each, in proportion to the number of their cows. Each brings his milk to be separated, is paid for the butter-making material it contains, and receives back skim milk. Any profit is divisible, nine-tenths to the suppliers of milk in proportion to the value of their supplies, and one-tenth to the dairy employees as dividend on wages. These dairies in 1900 produced butter worth more than £700,000. Their rapid spread is due to their great influence in improving the quality of butter, and hence raising the farmers' gains. The "agricultural" societies are chiefly engaged in buying farm requisites pure and cheap, and retailing them among their members; in this way they have saved the farmers very large sums. Their trade is about £100,000. The co-operative banks, many of them just beginning, are of the Raiffeisen type described later (though a few have limited liability) and aim at providing the peasants with necessary capital and expelling the usurer. They are increasing rapidly. Among miscellaneous objects of co-operation are selling eggs, poultry, barley, and pigs, joint ownership of machinery, joint grazing, potato-spraying, producing flax, and so on, and these promise a great growth in number and variety. The dairy societies, moreover, have federated into an agency for reaching the English market; and the agricultural societies into an Irish Wholesale for purchasing to the best advantage. Besides the direct profits and economies of these societies, they have greatly benefited Ireland by teaching men of all classes, parties, and religions to act together for peaceful progress; they have led to a wide diffusion of better agricultural knowledge, and to the establishment by Government of the Agricultural Department.

***Irish agriculture.***

Turning abroad we find, in almost all civilized countries,

important and growing movements roughly similar to those above described, but, on the whole, less identified with the working classes, and less coloured by their social and economic ideals. The most prominent fact since 1877 is the great growth of agricultural co-operation from small dimensions, till it amounts to a great force almost everywhere, and in some countries to a revolution; notably in Denmark, where almost every village is an example of varied co-operation, dealing with butter, eggs, bacon, stock, bee-keeping, or fruit-growing, or with the supply of household or farm requisites, to the great enrichment of the country. Co-operative dairies first appeared in Denmark in 1882; in 1900 they numbered 1052, dealt with four-fifths of all the milk of the country, and produced butter worth £7,000,000. Co-operative bacon factories began in 1887, and in 1900 dealt with six-tenths of all the pigs; and so on. Agricultural co-operation is now the strongest branch of the movement in France, and its backbone are the agricultural syndicates or associations. These, though they began only in 1883, numbered 1500 in 1895, and now probably number 2500, with 700,000 to 800,000 members. They are not technically co-operative societies, but rather trade unions, and they have certain political and professional aims; but they do an immense amount of co-operative work, especially in associated buying, and they spread the spirit of association everywhere, and promote many strictly co-operative societies. Everywhere the main features of this agricultural movement, alike in France, Germany, Italy, Belgium, Holland, or in Canada, New Zealand, and the United States, are similar to those we have seen in Ireland and Denmark; it is supplementary to individual cultivation; hardly ever does it appear as associations for cultivating in common, and, speaking generally, it has no very ideal aims, but seeks chiefly to give the farmer a better profit: especially it brings within reach of the peasant many of the advantages of large farming. In England there are a number of farms worked by stores, and several large associations for the supply of farm requisites, but the typical agricultural co-operation, based on the small village societies and federations of such societies, has been almost unknown. An attempt is, however, being made to promote such a movement on the lines which have been successful in Ireland.

*Foreign countries.*

As part of agricultural co-operation we may reckon the development of an entirely new type of credit co-operation. The Schultze-Delitzsch credit societies are primarily town institutions, and while they have multiplied and grown great, and sometimes grown capitalistic, many thousands of country folk have learnt to bless the little Raiffeisen loan banks. Such a bank is an association of neighbours uniting to borrow a sum of money, in order to lend it out as cheaply as possible in small sums to such of themselves as need loans. It also receives savings deposits, which often produce a large part or even all the capital the society needs to lend. Usually a few of the members are persons of rather more means than the others, and join to help their neighbours by increasing the society's credit. These have no special privilege, but by common consent they usually take a leading part. In the true Raiffeisen bank the liability of each member is unlimited, but limited liability has been introduced in some of its modifications. The society confines its operations strictly to a small area, say a parish, where every one knows every one. Each borrower must specify the purpose for which he wants a loan, say to buy a cow or drain a field, or pay off a moneylender, and this is rigorously inquired into. Any member, however poor, can obtain a loan for a profitable approved purpose, and no one, however rich, can obtain one on any other terms. Practically all the members see that the money is applied as agreed, and while the loans are often made for long periods—a year or two, or several, so as to repay themselves out of the profit—power is reserved to call them in at short notice if misapplied. No bills, mortgages, or other securities are taken, except a note of hand with sometimes one or two sureties. There are two committees, one to lend and do the work of the society, and the other to supervise the first. While the directors of the Schultze-Delitzsch societies get commission on the business done, there is no remuneration for services in the Raiffeisen societies except that the accountant gets a small salary. There are no shares, or only shares of a very small value, and practically nothing is paid on them as interest or dividend.

*Raiffeisen loan banks.*

These Raiffeisen banks boast that neither member nor creditor has ever lost a penny by them, and while this is denied, it seems at least near the truth. Their credit is so good that they can obtain money at very low rates, and as their expenses are trifling they can re-lend to their members at very little more. In Germany they usually lend at about 5 per cent. Only men of good character can obtain membership, and thus, besides spreading prosperity, these societies have everywhere been great promoters of sobriety and good conduct. They exist solely for the sake of the members as borrowers, and make no profit, except a little for reserve, whereas the Schultze-Delitzsch Bank works for profit, and puts first the interest of the members as small capitalists and lenders. The Raiffeisen banks have a purely mutual character, free from any element of capitalism; it is even alleged that the members can never divide out the reserve; if they fall short of the co-operative ideal it is in the matter of self-help, seeing that the presence of some richer members is necessary, or at least very desirable. In self-help the Schulze-Delitzsch system is specially strong. Raiffeisen founded the first such bank in 1849, just before Schultze-Delitzsch founded his first; the second in 1854. The third began in 1862, and so on. Not till 1880 did they begin really to spread.

Though co-operative credit societies are split up into innumerable groups, insisting on various minor modifications, and making various compromises between the two systems, these two types really include them all. They have spread from Germany into almost all European countries, even at last to Ireland and England, besides America and Asia. In Germany there were in March 1901, out of a total of 19,557 co-operative societies, 12,140 credit associations, and these lent out in 1900 more than £120,000,000. In Italy, Austria, and Hungary they are also strong. In 1896 it was estimated that £150,000,000 a year must be very well within the total amount lent by money co-operation on the Continent of Europe: £190,000,000 may be estimated for 1900. Of this total only a small percentage represents loans by banks of the Raiffeisen type, which, though very numerous, often lend only a few hundred pounds each in the year.

While English and some other forms of co-operation have always repudiated State help, and probably rightly so far as their own work is concerned, it is very noticeable that in the modern development of agriculture the action of the State and of local authorities has played a great part in performing or assisting functions which neither voluntary association nor individual enterprise could well perform alone; in providing technical education, expert advisers, exhibitions and prizes; in distributing information in all forms; in finding out markets, controlling railway rates, subsidizing steamboats, and even grading, branding, warehousing, and freezing produce, and maintaining trade agents abroad. These things have of course not been done for co-operative societies alone, but for agriculture in general; but co-operation has benefited, and much has been done expressly to encourage the formation of associations of cultivators, and provincial and national federations of such associations; and government departments of agriculture are found acting through such bodies, and with their advice and assistance. Indeed, harm has sometimes been done by subsidizing and forcing co-operative societies, whether for political motives or merely from mistaken policy. Experience shows that governments can do a very great deal, at least for agricultural co-operation, but only on condition that they encourage and do not undermine self-help and

*State action.*

private initiative. Thus while we sometimes find voluntary association advocated as a step towards, and sometimes on the other hand as a substitute for and bulwark against state-socialism, we find in practice these two forces working each in its own sphere and in a manner complementary one to the other, while underlying and essential to both is the force of individual action and self-help.

Amongst minor but still important developments may be mentioned the steady growth of co-operative production in France; the co-operative labour gangs, or rather societies, which undertake building and navvying work in Italy; the socialist co-operation, which supports political organizations, a press, and members of parliament, in Belgium; and the letting out of railway construction to co-operative groups of workmen in New Zealand and Victoria. It has been roughly estimated that altogether the members of one or other branch of co-operation number 6,000,000, representing with their families a population of 25,000,000 people.

**Coorg** (*Kodagu*=steep mountains), a province of India, administered by a Commissioner, subordinate to the Governor-General through the Resident of Mysore, who is officially also Chief Commissioner of Coorg. It lies in the south of the peninsula, on the plateau of the Western Ghats, sloping inland towards Mysore. It is now an attractive field of coffee cultivation, though the greater part is still under forest. The administrative headquarters are at Mercara (population, 7034).

Its area is 1583 square miles. In 1881 the population was 178,302; in 1891 it was 173,055, showing a decrease of 3 per cent., and an average density of 109 persons per square mile. This decrease is attributed partly to the decline of the coffee industry, and partly to the high mortality among immigrant coolies. The indigenous population increased by no less than 16 per cent., while the immigrant population decreased by 29 per cent. In 1897, which was an exceptionally unhealthy year, the registered death-rate was as high as 50·38 per thousand. Classified according to religion and race, the indigenous Coorgs numbered 32,611; Hindus, 124,234; Mahommedans, 12,665; native Christians, 2931; Europeans, 249; Eurasians, 212; Jains, 114; Parsis, 39. In 1901 the population was 180,461, showing an increase of 4 per cent.

The gross revenue in 1897–98 was Rs.8,38,000, and the total expenditure Rs.5,73,100. The cultivated area is 206,541 acres, of which 95,247 are under rice and 86,155 under coffee. The total area assessed for coffee is 106,611 acres, of which 31,732 acres are held by European planters. Some abandoned coffee land has been planted with tea, as an experiment. The cultivation of cinchona has proved unprofitable. The total exports are estimated at Rs.22,49,000, including 2462 tons of coffee, valued at Rs.19,69,600. The imports are estimated at Rs.29,02,000. There is no railway. In 1896–97 the number of schools was 120, attended by 5115 pupils. The proportion of boys at school was 30 per cent. of those of school-going age, compared with 2·3 per cent. for all India; the proportion of girls was 7 per cent., compared with 2·3 per cent. for all India. There are no colleges, but 24 scholarships are given to maintain Coorg students at colleges in Madras and Mysore. There are two secondary schools, at Mercara and Virajendrapet, with 647 pupils, two printing-presses, one of which issues the *Coorg Gazette,* and seven dispensaries.

**Copan.**—Since the time of Stephens this ruined city of the Mayas in North Honduras has again been several times visited by Mr A. P. Maudsley during the eighth and ninth decades of the 19th century. His chief finds have been some elaborately sculptured monoliths, standing still erect, or inclined like the Tower of Pisa, and a fine ornamental doorway of a temple. He has also made the important discovery that all the truncated pyramidal mounds were at one time crowned with temples, and are thus shown to be of the same character as those at Uxmal, Chichen-Itza, and other places in Yucatan, *i.e., teocalli,* "God's Houses," like the pyramids of Cholula, Teotihuacan, and Papantla in Mexico. Drawings, castings, and rubbings were taken of several of the monuments, and are published in the *Biologia Centrali-Americana.* Professor Eduard Seler of Berlin also explored the place in 1897, that is, less than three years after Maudsley's last visit, and found that in that short interval many of the remains had again become so thickly moss-grown that it was difficult to distinguish their outlines, while the forest clearings made by former explorers to reach the sites of the ancient buildings were once more overgrown with dense bush.

**Copenhagen** (Danish, *Kjöbenhavn,* "the merchants' haven"), the capital of Denmark, situated in 55° 41′ 13″ N. lat. and 12° 34′ 44″ E. long. Since 1875 the population has doubled itself, and in 1901, inclusive of the suburbs, amounted to 491,340. Not only has the city grown in extent also during this period, but considerable public improvements have been effected, the only alteration in the opposite direction being the destruction of the palace of Christiansborg by fire in 1884. Fortunately most of the art treasures which the palace contained were saved, but the edifice still remains a roofless ruin. The new public buildings are mostly found on the strip of land on which

the ramparts of the city formerly stood, and are in part intended to replace older less convenient structures, such as the new Royal Library, the new Polytechnic School, the new Mineralogical Museum, and the new Town Hall, an extensive and imposing edifice ornamented with a tower, of which the spire, when finished, will be the tallest in the North of Europe—about 330 feet. The Glyptothek was built by the State and the municipality, to accommodate a considerable collection of modern objects of art, the gift of a wealthy citizen, M. Jacobsen, who has spent very large sums upon objects of national interest. The new Museum of Industrial Art is an outcome of the movement for applying art to the commoner objects of industry. The old Royal Picture Gallery and the Collection of Engravings, which formerly occupied a portion of the upper storey of the palace of Christiansborg, are now located in the new State Museum of Art, which is situated in a corner of the Östre Anlæg, a fine public garden formed out of a portion of the old ramparts. A similar garden, but smaller, is the so-called Örstedspark. Besides these new Museum buildings, another is in contemplation, destined to receive the Museums of Northern Antiquities, the Ethnographic Museum, and some others, which are now very inconveniently housed in the so-called Prindseus Palais; but this new National Museum is to be built near the latter palace, and in part to replace it. Two private collections must also be mentioned, which, though the property of private persons, are accessible to the public. One of them is the New Glyptothek, a collection of antique sculptures belonging to M. Jacobsen, and preserved at his private residence. It contains a number of important specimens, and is one of the largest, if not the largest private collection of its kind out of Italy. The other is styled Dansk Folke-museum, and illustrates the domestic life of the Danish nation, particularly the peasantry, since 1600, by means of specimens of furniture, utensils, costumes, &c. The Frederik or Marble Church, the erection of which was begun in 1749 but discontinued in 1770, remained a ruin until 1874, when it was purchased by a wealthy banker, M. Tietgen, at whose expense the work was recommenced. The edifice was not carried up to the height originally intended, but the magnificent dome, which reminds one of the finest examples in Italy, is conspicuous far and wide. The diameter is only a few feet less than that of St Peter's in Rome. As the church now stands it is one of the principal works of the architect, F. Meldahl.

Not only is Copenhagen the political capital, but it is also the centre of the higher culture of the nation. It is the seat of the university, which has 80 professors and lecturers, with an average number of about 1900 students, and is fully equipped with the requisite scientific apparatus, such as a library, observatory, botanical garden, museums for natural history, and other collections, laboratories, &c. The Royal Library is one of the largest institutions of its kind. The learned societies comprise the Royal Society of Sciences, the Society of Northern Antiquaries, and numerous others. Technical instruction is provided by the Polytechnic School, which is a State institution; the School of the Technical Society, which, though a private foundation, enjoys public subvention; and also by the High School of Agriculture, Veterinary Art, and Forestry, with 30 professors and lecturers. The schools which prepare for the university, &c., are nearly all private, but are all under the control of the State. Elementary instruction is mostly provided by the communal schools, of which there are thirty within the area of the municipality. Twenty of these are free; ten, in which a somewhat fuller education is given, exact fees. The expense incurred by the municipality for schools, over and above the amount of the school fees, was in 1897, £110,000. The number of children in the area mentioned was 49,337, of whom 37,248 received instruction in the communal schools.

Copenhagen is by far the most important commercial town in Denmark, and has fully shared the steady and considerable increase in the trade of the country during the last thirty years. According to an estimate furnished by the director of the Statistical Bureau of Denmark, the annual value of the exports by sea may be taken at 168 million crowns, or £9,500,000; that of the imports at 295 million crowns, or £16,400,000. The trading capabilities have been much increased by the construction of the new Free Port, at the northern extremity of the town, well supplied with warehouses and other conveniences. It is connected with the main railway station by means of a new circular railway, while a short branch connects it with the ordinary custom-house quay. Advantage has been taken of the facilities afforded by the free port to establish a more perfect steam communication with Sweden particularly in order to accommodate through traffic. Within a short distance of the free port is the station of the new Eastern Railway, which runs along the shore of the Sound, connecting Copenhagen with Elsinore by a direct line. At the end of 1899, 284 sailing vessels above four tons, with an aggregate tonnage of 18,145 tons, belonged to Copenhagen, while the steamers numbered 292, with a collective tonnage of 219,055 tons. In 1899, 9200 clearances inwards were effected by sailing vessels, 9177 by steamers. Of the former, 4391 were Danish vessels, 4181 Swedish, only 14 English. Of the steamers, 7057 were Danish, 338 were English. Besides these, a limited number of passing vessels touched the port. The inward-bound cargoes amounted to 1,580,002 tons, of which 955,557 were carried in Danish bottoms. The cargoes which arrived from foreign ports amounted to 1,366,637 tons, of which 750,257 tons were in Danish bottoms. The total of the outward-bound cargoes was 720,671 tons, of which 573,233 were carried in Danish bottoms; of this total, 391,052 were destined for foreign ports, of which 248,945 were in Danish bottoms. The total of the cargoes exchanged between Copenhagen and other Danish ports was 542,984 tons, of which but a very small proportion was carried by foreign vessels. The total of exports and imports by sea was 2,300,670 tons, of which 1,895,559 tons were carried by steamers. Copenhagen is not an industrial town. The manufactures carried on are mostly only such as exist in every large town, and the export of manufactured goods is inconsiderable. The only very large establishment is one for the construction of iron steamers, engines, &c., but some factories have been erected within the area of the free port for the purpose of working up imported raw materials duty free. (C. A. G.)

**Coppée, Francis Edouard Joachim** (known as **François**) (1842———), French poet and novelist, was born in Paris, 12th January 1842. His father held a small post in the Civil Service, and he owed much to the care of an admirable mother. After passing through the Lycée Saint-Louis, he became a clerk in the Ministry of War, and soon sprang into public favour as a poet of the young "Parnassian" school. His first verses date from 1864. They were republished with others in 1866 in a collected form (*Le Reliquaire*), followed (1867) by the successful *Intimités* and *Poèmes Modernes* (1867–69). In the latter year his first play, *Le Passant*, was received with marked approval at the Odéon Theatre, and later *Fais ce que dois* and *Les Bijoux de la Délivrance*, short metrical dramas inspired by the war, were warmly applauded. After filling a post in the Library of the Senate, M. Coppée was chosen in 1878 as archivist of the Comédie-Française, an office which he held till 1884. In

that year his election to the Academy caused him to retire altogether from his public appointments. Meanwhile he continued to publish volumes of poetry at frequent intervals, including *Les Humbles* (1872), *Le Cahier Rouge* (1874), *Olivier* (1875), *L'Exilée* (1876), *Contes en Vers*, &c. (1881), *Poèmes et Récits* (1886), *Arrière-Saison* (1887), and others. Of late years he has printed but little poetry, unless aroused by some occasion of public interest, such as the visit of the Tsar to Paris (1896). Besides the plays mentioned above, two others written in collaboration with M. d'Artois, and some light pieces of little importance, M. Coppée has produced *Madame de Maintenon* (1881), *Severo Torelli* (1883), *Les Jacobites* (1885), and other serious dramas in verse, including *Pour la Couronne* (1895). The performance of a short episode of the Commune, *Le Pater*, was prohibited by the Government (1885). M. Coppée's first story in prose, *Une Idylle pendant le Siège*, appeared in 1875. It was followed by various volumes of short tales, by *Toute une Jeunesse*,—an attempt to reproduce the feelings, if not the actual wants, of the writer's youth,—by *Les Vrais Riches* (1892), by *Le Coupable* (1896), &c. A series of reprinted short articles on miscellaneous subjects, styled *Mon Franc Parler*, appeared from 1893 to 1896; and in 1898 was published *La Bonne Souffrance*, the outcome of M. Coppée's reconversion to the Roman Catholic Church, which has gained very wide popularity. The immediate cause of his return to the faith was a severe illness which twice brought him to the verge of the grave. Hitherto he had taken little open interest in public affairs, but he now joined the most violent section of Nationalist politicians, while retaining contempt for the whole apparatus of democracy. He took a leading part against the prisoner in the Dreyfus case, and was one of the originators of the notorious Ligue de la Patrie Française. M. Coppée, who became an officer of the Legion of Honour in 1888, has a home at Mandres, near Boissy St Léger. He has published a collected edition of his poetry and another of his plays, and remains one of the most popular of French writers. Alike in verse and prose, he concerns himself with the plainest expressions of human emotion, with elemental patriotism, and the joy of young love, and the pitifulness of the poor, bringing to bear on each a singular gift of sympathy and insight. The lyric and idyllic poetry, by which he will chiefly be remembered, is animated by musical charm, and in some instances, such as *La Bénédiction* and *La Grève des Forgerons*, displays a vivid, though not a sustained, power of expression. There is force, too, in the gloomy tale *Le Coupable*. But he exhibits all the defects of his qualities. In prose especially, his sentiment often degenerates into sentimentality, and he continually approaches, and sometimes oversteps, the verge of the trivial. Nevertheless, by neglecting that canon of contemporary art which would reduce the deepest tragedies of life to mere subjects for dissection, he has won those common suffrages which he fully deserves, and which, where literature is concerned, he probably does not undervalue.

**Copper.**—The sources of copper, its applications and its metallurgy, have undergone great changes. Forty years ago Chile was the largest producer, reaching her maximum in 1869 with 54,867 tons; but in 1899 her production had fallen off to 25,000 tons. Great Britain, though she had made half the world's copper in 1830, held second place in 1860, making from native ores 15,968 tons; in 1898 her production was only 640 tons. The United States made only 572 tons in 1850, and 12,600 tons in 1870; but she to-day makes more than 60 per cent. of the world's total. Le Play estimated the world's production in 1850 at 52,400 tons. It is now about ten times as great. The statistics for 1899, prepared by H. R. Merton and Co., are as follows, in English tons of fine copper:—

| | |
|---|---|
| United States | 262,206 |
| Spain and Portugal | 53,720 |
| Japan | 27,560 |
| Chile | 25,000 |
| Germany | 23,460 |
| Australia | 20,750 |
| Mexico | 19,335 |
| Producers of under 10,000 tons each | 44,835 |
| Total | 476,866 |

As the stock on hand rarely exceeds three months' demand, and is often little more than a month's supply, it is evident that consumption has kept close pace with production. This extraordinary increase corresponds closely with that of pig iron, of which the world's production was about 3,600,000 tons in 1850, and 35,921,617 tons in 1898. The world, therefore, has needed these two metals in almost equal proportions for the development of modern mechanical industry. Great Britain is still the largest copper consumer. The statistics of consumption for 1898 assign to—

| | | |
|---|---|---|
| Great Britain | 139,704 tons, or 32·1 % | of the world's production |
| United States | 120,348 ,, ,, 27·7 % | ,, ,, ,, |
| Germany | 70,000 ,, ,, 16·1 % | ,, ,, ,, |
| France | 42,652 ,, ,, 9·7 % | ,, ,, ,, |

The large demand for copper to be used in sheathing ships ceased on the introduction of iron in shipbuilding because of the difficulty of coating iron with an impervious layer of copper; but the consumption in the manufacture of electric apparatus and for electric conductors has far more than compensated.

The scale on which modern mines are worked and modern smelters planned has reached proportions formerly unknown. For example, the Rio Tinto Company in Spain and the Anaconda in Butte, Montana, each handles between one and a half and two million tons of ore a year; and these companies, with the Calumet and Hecla, and the Boston and Montana Companies, make more than one-third of the world's total. This has brought about a corresponding increase in the scale of the machinery used:—(1) *mechanical calciners* have in great measure taken the place of hand furnaces; (2) both *reverberatory and cupola furnaces*, as well as their auxiliary apparatus, have been enlarged; and mechanical appliances have been adapted to both for the purpose of saving hand labour; (3) the *pneumatic method* in Bessemer converters of concentrating ore to metallic copper has been applied very extensively; (4) some progress has been made towards smelting ores by the heat of combustion of their own elements, through what is known as *pyritic smelting*; and some new smelting methods have been introduced, notably the direct process of Messrs Nicholls and James; (5) the *electrolytic refining* of copper has come into general use.

*Calcination and calcining furnaces.*—As most copper ores contain sulphur, which can be driven off at low temperatures as sulphurous acid gas, calcination is a preliminary to smelting. To aid in extracting the sulphur mechanical agitation is almost universally resorted to. Three types of mechanical calciners are used, all developments of English inventions. In the White-Howell revolving cylinder furnace with lifters—a modification of the Oxland—the ore is fed and discharged in a continuous stream. The Brückner cylinder resembles the Elliot and Russell black ash furnace; its cylinder tapers slightly towards each end and is generally 18 feet long by 8 feet 6 inches in its greatest diameter. Its charge of from 8 to 12 tons of ore or concentrates is slowly agitated at a rate of three revolutions a minute, and in from 24 to 36 hours it is reduced from say 40 or 35 per cent. to 7 per

cent. of sulphur. The ore is under better control than is possible with the continuous feed and discharge, and when sufficiently roasted can be passed red-hot to the reverberatory furnace. These advantages compensate for the wear and tear and the cost of moving the heavy dead-weight. The M'Dougall furnace is turret-shaped, and consists of a series of circular hearths, on which the ore is agitated by rakes attached to revolving arms and made to fall from hearth to hearth. It has been modified by Herreshoff, who uses a large hollow revolving central shaft cooled by a current of air. The shaft is provided with sockets, into which movable arms with their rakes are readily dropped. The Peter Spence type of calcining furnace has been followed in a large number of inventions. In some the rakes are attached to rigid frames, with a reciprocating motion, in others to cross-bars moved by revolving chains. Some of these furnaces are straight, others circular. Some have only one hearth, others three. This and the previous type of furnace, owing to their large capacity, are at present in greatest favour. The M'Dougall-Herreshoff, working on ores of over 30 per cent. of sulphur, requires no fuel; but in furnaces of the Spence-O'Hara type fuel must be used, as an excess of air enters through the slotted sides and the hinged doors which open and shut frequently to permit of the passage of the rakes. The consumption of fuel, however, does not exceed 1 of coal to 10 of ore. The quantity of ore which these large furnaces, with a hearth area as great as 2000 feet and over, will roast varies from 40 to 60 tons a day. Shaft calcining furnaces like the Gerstenhoffer, Hasenclaver, and others designed for burning pyrites fines have not found favour in modern copper works. Kilns and stalls roast so small a quantity that they would cover too much ground and involve too much handling.

*The fusion of ores in reverberatory and cupola furnaces.*—After the ore has been partially calcined, it is smelted to extract its earthy matter and to concentrate the copper with part of its iron and sulphur into a matte. In reverberatory furnaces it is smelted by fuel in a fireplace, separate from the ore, and in cupolas the fuel, generally coke, is in direct contact with the ore. When Swansea was the centre of the copper-smelting industry in Europe, many varieties of ores from different mines were smelted in the same furnaces, and the Welsh reverberatory furnaces were used. To-day more than eight-tenths of the copper ores of the world are reduced to impure copper bars or to fine copper at the mines; and where the character of the ore permits, the cupola furnace is found more economical in both fuel and labour than the reverberatory.

The Welsh method, with its seven or eight operations, finds adherents only in Wales and Chile. In America the usual method is to roast ores or concentrates so that the matte yielded by either the reverberatory or cupola furnace will run from 45 to 50 per cent. in copper, and then to transfer to the Bessemer converter, which blows it up to 99 per cent. In Butte, Montana, reverberatories have in the past been preferred to cupola furnaces, as the charge has consisted mainly of fine roasted concentrates; but even there the cupola is gaining ground. To smelt Butte ores there are about 75 reverberatories, but the number will be reduced by the replacement of small by large furnaces, heated by gas instead of solid fuel. At the Boston and Montana works tilting reverberatories, modelled after open hearth steel furnaces, were first erected; but they were found to possess objectionable features. Now both these and the egg-shaped reverberatories are being abandoned for furnaces as long as 43 feet 6 inches from bridge to bridge and of a width of 15 feet 9 inches, heated by gas, with regenerative checker work at each end, and fed with ore or concentrates, red-hot from the calciners, through a line of hoppers suspended above the roof. Furnaces of this size smelt 200 tons of charge a day. But even when the old type of reverberatory is preferred, as at the Argo works, Colorado, where rich gold- and silver-bearing copper matte is made, the growth of the furnace in size has been steady. Richard Pearce's reverberatories in 1878 had an area of hearth of 15 feet by 9 feet 8 inches, and smelted 12 tons of cold charge daily, with a consumption of 1 ton of coal to 2·4 tons of ore. His present furnaces are 35 feet by 16 feet, and smelt 50 tons daily of hot ore, with the consumption of 1 ton of coal to 3·7 tons of ore.

The home of cupola smelting was Germany, where it has never ceased to make steady progress. In Mansfeld brick cupola furnaces are without a rival in size, equipment, and performance. They are round stacks, designed on the model of iron blast furnaces, 29 feet high, fed mechanically, and provided with stoves to heat the blast by the furnace gases. The low percentage of sulphur in the roasted ore is little more than enough to produce a matte of 40 to 45 per cent., and therefore the escaping gases are better fitted than those of most copper cupola furnaces for burning in a stove. But as the slag carries on an average 46 per cent. of silica, it is only through the utmost skill that it can be made to run as low on an average as 0·3 per cent. in copper oxide. As the matte contains on an average 0·2 per cent. of silver, it is still treated by the Ziervogel wet method of extraction, the management dreading the loss which might occur in the Bessemer process of concentration, applied as preliminary to electrolytic separation. Blast furnaces of large size, built of brick, have of late years treated the richest and more silicious ores of Rio Tinto, and at present the Rio Tinto Company is introducing converters at the mine. This method of extraction contrasts favourably in time with the leaching process, which is so slow that over 10,000,000 tons of ore are always under treatment on the immense leaching floors of the company's works in Spain. In the United States the cupola has undergone a radical modification in being built of water-jacketed sections. The first water-jacketed cupola which came into general use was a circular inverted cone, with a slight taper, of 36 inches' diameter at the tuyeres, and composed of an outer and an inner metal shell, between which water circulated. As greater size has been demanded, oval and rectangular furnaces—as large as 180 inches by 56 inches at the tuyeres—have been built in sections of cast or sheet iron or steel. A single section can be removed and replaced without entirely emptying the stack, as a shell of congealed slag always coats the inner surface of the jacket. The largest furnaces are those of the Boston and Montana Company at Great Falls, Montana, which have put through 500 tons of charge daily, pouring their melted slag and matte into large wells of 10 feet in diameter. A combined brick- and water-cooled furnace was first used by the Oxford Copper Company, and has been adopted by the Iron Mountain Company at Kerwick, Cal., for matte concentration. In it the cooling is effected by water pipes, interposed horizontally between the layers of bricks. The Mt. Lyell smelting works in Tasmania, which are of special interest, will be referred to later.

*Concentrating matte to copper in the Bessemer converter.*—As soon as the pneumatic method of decarburizing pig iron was accepted as practicable, experiments were made with a view to Bessemerizing copper ores and mattes. One of the earliest and most exhaustive series of experiments was made on Rio Tinto ores at the John Brown works by Mr John Holloway, with the ambitious aim of both smelting the ore and concentrating the matte in the same furnace, by the heat evolved through the oxidation of their sulphur and iron. Experiments along the same lines were made by Francis Bawden at Rio Tinto and Claude Vautin in Australia. The difficulty of effecting

this double object in one operation was so great that in subsequent experiments the aim was merely to concentrate the matte to metallic copper in converters of the Bessemer type. The concentration was effected without any embarrassment till metallic copper commenced to separate and chill in the bottom tuyeres. To meet this obstacle M. Manhès proposed elevated side tuyeres, which could be kept clear by punching through gates in a wind box. His invention was adopted by the Vivians, at the Aiguelles works in France, and at Leghorn in Italy. But the greatest expansion of this method has been in the United States, where now more than 400,000,000 ℔ of copper are annually made in Bessemer converters. Vessels of several designs are used—some modelled exactly after steel converters, others barrel-shaped, but all with side tuyeres elevated about 10 inches above the level of the bottom lining. Practice, however, in treating copper matte differs essentially from the treatment of pig iron, inasmuch as from 20 to 30 per cent. of iron must be eliminated as slag and an equivalent quantity of silica must be supplied. The only practical mode of doing this, as yet devised, is by lining the converter with a silicious mixture. This is so rapidly consumed that the converters must be cooled and partially re-lined after 3 to 6 charges, dependent on the iron contents of the matte. When available, a silicious rock containing copper or the precious metals is of course preferred to barren lining. The material for lining, and the frequent replacement thereof, constitute the principal expense of the method. The other items of cost are *labour*, the quantity of which depends on the mechanical appliances provided for handling the converter shells and inserting the lining; and the *blast*, which in barrel-shaped converters is low and in vertical converters is high, and which varies therefore from 3 to 15 ℔ to the square inch. The quantity of air consumed in a converter which will blow up about 35 tons of matte per day is about 3000 cubic feet per minute. The operation of raising a charge of 50 per cent. matte to copper usually consists of two blows. The first blow occupies about 25 minutes, and oxidizes all but a small quantity of the iron and some of the sulphur, raising the product to white metal. The slag is then poured and skimmed, the blast turned on and converter re-tilted. During the second blow the sulphur is rapidly oxidized, and the charge reduced to metal of 99 per cent. in from 30 to 40 minutes. Little or no slag results from the second blow. That from the first blow contains between 1 per cent. and 2 per cent. of copper, and is usually poured from ladles operated by an electric crane into a reverberatory, or into the settling well of the cupola. The matte also, in all economically planned works, is conveyed, still molten, by electric cranes from the furnace to the converters. When lead or zinc is not present in notable quantity, the loss of the precious metals by volatilization is slight, but more than 5 per cent. of these metals in the matte is prohibitive. Under favourable conditions in the larger works of the United States the cost of converting a 50 per cent. matte to metallic copper is generally understood to be only about $\frac{5}{10}$ to $\frac{6}{10}$ of a cent per ℔ of refined copper.

*Pyritic smelting.*—The heat generated by the oxidation of iron and sulphur has always been used to maintain combustion in the kilns or stalls designed for roasting pyrites. Since Holloway's and other early experiments, no serious attempts have been made to utilize the heat escaping from a converting vessel in smelting ore and matte either in the same apparatus or in a separate furnace. But considerable progress has been made in smelting highly sulphuretted ores by the heat of their own oxidizable constituents. At Tilt Cove, Newfoundland, the Cape Copper Company smelted copper ore, with just the proper proportion of sulphur, iron, and silica, successfully without any fuel, when once the initial charge had been fused with coke. The furnaces used were of ordinary design and built of brick. Lump ore alone was fed, and the resulting matte showed a concentration of only 3 into 1. When, however, a hot blast is used on highly sulphuretted copper ores, a concentration of 8 of ore into 1 of matte is obtained, with a consumption of less than one-third the fuel which would be consumed in smelting the charge had the ore been previously calcined. A great impetus to pyritic smelting was given by the investigations of Mr W. L. Austin, of Denver, Colorado, and both at Leadville and Silverton raw ores are successfully smelted with as low a fuel consumption as 3 of coke to 100 of charge. But the largest establishment in which advantage is taken of the self-contained fuel is at the smelting works of the Mt. Lyell Company, Tasmania. There the blast is raised from 600° to 700° F. in stoves heated by extraneous fuel, and the raw ore smelted with only 3 per cent. of coke. The ore is a compact iron pyrites containing, of copper 2·5 per cent., of silver 3·83 oz., of gold 0·139 oz. It is smelted raw with hot blast in cupola furnaces, the largest being 210 in. by 40 in. The resulting matte runs 25 per cent. This is reconcentrated raw in hot-blast cupolas to 55 per cent., and blown directly into copper in converters. Thus these ores, as heavily charged with sulphur as those of the Rio Tinto, are speedily reduced by three operations and without roasting, with a saving of 97·6 per cent. of the copper, 93·2 per cent. of the silver, and 93·6 per cent. of the gold.

*The Nicholls and James process.*—Messrs Nicholls and James have applied, very ingeniously, well-known reactions to the refining of copper, raised to the grade of white metal. This process is practised by the Cape Copper and Elliot Metal Company. A portion of the white metal is calcined to such a degree of oxidation that when fused with the unroasted portion, the reaction between the oxygen in the roasted matte and the sulphur in the raw material liberates the metallic copper. The metal is so pure that it can be refined by a continuous operation in the same furnace.

*Electrolytic refining and separation of gold and silver.*—The principles have long been known on which is based the electrolytic separation of copper from the certain elements which generally accompany it, whether these, like silver and gold, are valuable, or, like arsenic, antimony, bismuth, silenium, and tellurum, are merely impurities. But it was not until the dynamo was improved as a machine for generating large quantities of electricity at a very low cost that the electrolysis of copper could be practised on a commercial scale. To-day, by reason of other uses to which electricity is applied, electrically deposited copper of high conductivity is in ever-increasing demand, and commands a higher price than copper refined by fusion. This increase in value permits of copper with not over £2 or $10 worth of the precious metals being profitably subjected to electrolytic treatment. Thus many million ounces of silver and a great deal of gold are recovered which formerly were lost. The mining district of Butte, Mont., alone produces annually about 10,000,000 ounces of silver and 40,000 ounces of gold, all of which is recovered by electrolytic separation. The methods of electrolytic refining used in Europe and America necessarily differ only in detail. (See ELECTRO-CHEMISTRY.) Most of them employ the *multiple system*, in which the soluble anodes of cast copper and cathodes of thin copper strippings are hung in lead-lined vats. A few works have adopted the *series system*, in which the anodes are sheets of rolled copper, one side of which is being dissolved while the refined copper is being deposited on the reverse from the adjacent sheet.
